Socrates:: How can there be purity in whiteness, and what purity? Is that purest which is greatest or most in quantity, or that which is most unadulterated and freest from any admixture of other colors?

Protarchus:: Clearly that which is most unadulterated.

Socrates:: True, Protarchus; and so the purest white, and not the greatest or largest in quantity, is to be deemed truest and most beautiful?

Protarchus:: Right.

Socrates:: And we shall be quite right in saying that a little pure white is whiter and fairer and truer than a great deal that is mixed.

Protarchus:: Perfectly right.

Socrates:: There is no need of adducing many similar examples in illustration of the argument about pleasure; one such is sufficient to prove to us that a small pleasure or a small amount of pleasure, if pure or unalloyed with pain, is always pleasanter and truer and fairer than a great pleasure or a great amount of pleasure of another kind.

Protarchus:: Assuredly; and the instance you have given is quite sufficient.

Socrates:: But what do you say of another question:—have we not heard that pleasure is always a generation, and has no true being? Do not certain ingenious philosophers teach this doctrine, and ought not we to be grateful to them?

Protarchus:: What do they mean?

Socrates:: I will explain to you, my dear Protarchus, what they mean, by putting a question.

Protarchus:: Ask, and I will answer.

Socrates:: I assume that there are two natures, one self-existent, and the other ever in want of something.

Protarchus:: What manner of natures are they?

Socrates:: The one majestic ever, the other inferior.

Protarchus:: You speak riddles.

Socrates:: You have seen loves good and fair, and also brave lovers of them.

Protarchus:: I should think so.

Socrates:: Search the universe for two terms which are like these two and are present everywhere.

Protarchus:: Yet a third time I must say1, Be a little plainer, Socrates.

Socrates:: There is no difficulty, Protarchus; the argument is only in play, and insinuates that some things are for the sake of something else (relatives), and that other things are the ends to which the former class subserve (absolutes).

Protarchus:: Your many repetitions make me slow to understand.

Socrates:: As the argument proceeds, my boy, I dare say that the meaning will become clearer.

Protarchus:: Very likely.

Socrates:: Here are two new principles.

Protarchus:: What are they?

Socrates:: One is the generation of all things, and the other is essence.

Protarchus:: I readily accept from you both generation and essence.

Socrates:: Very right; and would you say that generation is for the sake of essence, or essence for the sake of generation?

Protarchus:: You want to know whether that which is called essence is, properly speaking, for the sake of generation?

Socrates:: Yes.

Protarchus:: By the gods, I wish that you would repeat your question.

Socrates:: I mean, O my Protarchus, to ask whether you would tell me that ship-building is for the sake of ships, or ships for the sake of ship-building? and in all similar cases I should ask the same question.

Protarchus:: Why do you not answer yourself, Socrates?

Socrates:: I have no objection, but you must take your part.

Protarchus:: Certainly.

Socrates:: My answer is, that all things instrumental, remedial, material, are given to us with a view to generation, and that each generation is relative to, or for the sake of, some being or essence, and that the whole of generation is relative to the whole of essence.

Protarchus:: Assuredly.

Socrates:: Then pleasure, being a generation, must surely be for the sake of some essence?

Protarchus:: True.

Socrates:: And that for the sake of which something else is done must be placed in the class of good, and that which is done for the sake of something else, in some other class, the class of my good friend.

Protarchus:: Most certainly.

Socrates:: Then pleasure, being a generation, will be rightly placed in some other class than that of good?

Protarchus:: Quite right.

Socrates:: Then, as I said at first, we ought to be very grateful to him who first pointed out that pleasure was a generation only, and had no true being at all; for he is clearly one who laughs at the notion of pleasure being a good.

Protarchus:: Assuredly.

Socrates:: And he would surely laugh also at those who make generation their highest end.

Protarchus:: Of whom are you speaking, and what do they mean?

Socrates:: I am speaking of those who when they are cured of hunger or thirst or any other defect by some process of generation are delighted at the process as if it were pleasure; and they say that they would not wish to live without these and other feelings of a like kind which might be mentioned.

Protarchus:: That is certainly what they appear to think.

Socrates:: And is not destruction universally admitted to be the opposite of generation?

Protarchus:: Certainly.

Socrates:: Then he who chooses thus, would choose generation and destruction rather than that third sort of life, in which, as we were saying, was neither pleasure nor pain, but only the purest possible thought.

Protarchus:: He who would make us believe pleasure to be a good is involved in great absurdities, Socrates.

Socrates:: Great, indeed; and there is yet another of them.

Protarchus:: What is it?

Socrates:: Is there not an absurdity in arguing that there is nothing good or noble in the body, or in anything else, but that good is in the soul only, and that the only good of the soul is pleasure; and that courage or temperance or understanding, or any other good of the soul, is not really a good?—and is there not yet a further absurdity in our being compelled to say that he who has a feeling of pain and not of pleasure is bad at the time when he is suffering pain, even though he be the best of men; and again, that he who has a feeling of pleasure, in so far as he is pleased at the time when he is pleased, in that degree excels in virtue?

Protarchus:: Nothing, Socrates, can be more irrational than all this.

Socrates:: And now, having subjected pleasure to every sort of test, let us not appear to be too sparing of mind and knowledge; let us ring their metal bravely, and see if there be unsoundness in any part, until we have found out what in them is of the purest nature; and then the truest elements both of pleasure and knowledge may be brought up for judgment.

Protarchus:: Right.

Socrates:: Knowledge has two parts,—the one productive, and the other educational?

Protarchus:: True.

Socrates:: And in the productive or handicraft arts, is not one part more akin to knowledge, and the other less; and may not the one part be regarded as the pure, and the other as the impure?

Protarchus:: Certainly.

Socrates:: Let us separate the superior or dominant elements in each of them.

Protarchus:: What are they, and how do you separate them?

Socrates:: I mean to say, that if arithmetic, mensuration, and weighing be taken away from any art, that which remains will not be much.

Protarchus:: Not much, certainly.

Socrates:: The rest will be only conjecture, and the better use of the senses which is given by experience and practice, in addition to a certain power of guessing, which is commonly called art, and is perfected by attention and pains.

Protarchus:: Nothing more, assuredly.

Socrates:: Music, for instance, is full of this empiricism; for sounds are harmonized, not by measure, but by skilful conjecture; the music of the flute is always trying to guess the pitch of each vibrating note, and is therefore mixed up with much that is doubtful and has little which is certain.

Protarchus:: Most true.

Socrates:: And the same will be found to hold good of medicine and husbandry and piloting and generalship.

Protarchus:: Very true.

Socrates:: The art of the builder, on the other hand, which uses a number of measures and instruments, attains by their help to a greater degree of accuracy than the other arts.

Protarchus:: How is that?

Socrates:: In ship-building and house-building, and in other branches of the art of carpentering, the builder has his rule, lathe, compass, line, and a most ingenious machine for straightening wood.

Protarchus:: Very true, Socrates.

Socrates:: Then now let us divide the arts of which we were speaking into two kinds,—the arts which, like music, are less exact in their results, and those which, like carpentering, are more exact.

Protarchus:: Let us make that division.

Socrates:: Of the latter class, the most exact of all are those which we just now spoke of as primary.

Protarchus:: I see that you mean arithmetic, and the kindred arts of weighing and measuring.

Socrates:: Certainly, Protarchus; but are not these also distinguishable into two kinds?

Protarchus:: What are the two kinds?

Socrates:: In the first place, arithmetic is of two kinds, one of which is popular, and the other philosophical.

Protarchus:: How would you distinguish them?

Socrates:: There is a wide difference between them, Protarchus; some arithmeticians reckon unequal units; as for example, two armies, two oxen, two very large things or two very small things. The party who are opposed to them insist that every unit in ten thousand must be the same as every other unit.

Protarchus:: Undoubtedly there is, as you say, a great difference among the votaries of the science; and there may be reasonably supposed to be two sorts of arithmetic.

Socrates:: And when we compare the art of mensuration which is used in building with philosophical geometry, or the art of computation which is used in trading with exact calculation, shall we say of either of the pairs that it is one or two?

Protarchus:: On the analogy of what has preceded, I should be of opinion that they were severally two.

Socrates:: Right; but do you understand why I have discussed the subject?

Protarchus:: I think so, but I should like to be told by you.

Socrates:: The argument has all along been seeking a parallel to pleasure, and true to that original design, has gone on to ask whether one sort of knowledge is purer than another, as one pleasure is purer than another.

Protarchus:: Clearly; that was the intention.

Socrates:: And has not the argument in what has preceded, already shown that the arts have different provinces, and vary in their degrees of certainty?

Protarchus:: Very true.

Socrates:: And just now did not the argument first designate a particular art by a common term, thus making us believe in the unity of that art; and then again, as if speaking of two different things, proceed to enquire whether the art as pursued by philosophers, or as pursued by non-philosophers, has more of certainty and purity?

Protarchus:: That is the very question which the argument is asking.

Socrates:: And how, Protarchus, shall we answer the enquiry?

Protarchus:: O Socrates, we have reached a point at which the difference of clearness in different kinds of knowledge is enormous.

Socrates:: Then the answer will be the easier.

Protarchus:: Certainly; and let us say in reply, that those arts into which arithmetic and mensuration enter, far surpass all others; and that of these the arts or sciences which are animated by the pure philosophic impulse are infinitely superior in accuracy and truth.

Socrates:: Then this is your judgment; and this is the answer which, upon your authority, we will give to all masters of the art of misinterpretation?

Protarchus:: What answer?

Socrates:: That there are two arts of arithmetic, and two of mensuration; and also several other arts which in like manner have this double nature, and yet only one name.

Protarchus:: Let us boldly return this answer to the masters of whom you speak, Socrates, and hope for good luck.

Socrates:: We have explained what we term the most exact arts or sciences.

Protarchus:: Very good.

Socrates:: And yet, Protarchus, dialectic will refuse to acknowledge us, if we do not award to her the first place.

Protarchus:: And pray, what is dialectic?

Socrates:: Clearly the science which has to do with all that knowledge of which we are now speaking; for I am sure that all men who have a grain of intelligence will admit that the knowledge which has to do with being and reality, and sameness and unchangeableness, is by far the truest of all. But how would you decide this question, Protarchus?

Protarchus:: I have often heard Gorgias maintain, Socrates, that the art of persuasion far surpassed every other; this, as he says, is by far the best of them all, for to it all things submit, not by compulsion, but of their own free will. Now, I should not like to quarrel either with you or with him.

Socrates:: You mean to say that you would like to desert, if you were not ashamed?

Protarchus:: As you please.

Socrates:: May I not have led you into a misapprehension?

Protarchus:: How?

Socrates:: Dear Protarchus, I never asked which was the greatest or best or usefullest of arts or sciences, but which had clearness and accuracy, and the greatest amount of truth, however humble and little useful an art. And as for Gorgias, if you do not deny that his art has the advantage in usefulness to mankind, he will not quarrel with you for saying that the study of which I am speaking is superior in this particular of essential truth; as in the comparison of white colors, a little whiteness, if that little be only pure, was said to be superior in truth to a great mass which is impure. And now let us give our best attention and consider well, not the comparative use or reputation of the sciences, but the power or faculty, if there be such, which the soul has of loving the truth, and of doing all things for the sake of it; let us search into the pure element of mind and intelligence, and then we shall be able to say whether the science of which I have been speaking is most likely to possess the faculty, or whether there be some other which has higher claims.

Protarchus:: Well, I have been considering, and I can hardly think that any other science or art has a firmer grasp of the truth than this.

Socrates:: Do you say so because you observe that the arts in general and those engaged in them make use of opinion, and are resolutely engaged in the investigation of matters of opinion? Even he who supposes himself to be occupied with nature is really occupied with the things of this world, how created, how acting or acted upon. Is not this the sort of enquiry in which his life is spent?

Protarchus:: True.

Socrates:: He is laboring, not after eternal being, but about things which are becoming, or which will or have become.

Protarchus:: Very true.

Socrates:: And can we say that any of these things which neither are nor have been nor will be unchangeable, when judged by the strict rule of truth ever become certain?

Protarchus:: Impossible.

Socrates:: How can anything fixed be concerned with that which has no fixedness?

Protarchus:: How indeed?

Socrates:: Then mind and science when employed about such changing things do not attain the highest truth?

Protarchus:: I should imagine not.

Socrates:: And now let us bid farewell, a long farewell, to you or me or Philebus or Gorgias, and urge on behalf of the argument a single point.

Protarchus:: What point?

Socrates:: Let us say that the stable and pure and true and unalloyed has to do with the things which are eternal and unchangeable and unmixed, or if not, at any rate what is most akin to them has; and that all other things are to be placed in a second or inferior class.

Protarchus:: Very true.

Socrates:: And of the names expressing cognition, ought not the fairest to be given to the fairest things?

Protarchus:: That is natural.

Socrates:: And are not mind and wisdom the names which are to be honored most?

Protarchus:: Yes.

Socrates:: And these names may be said to have their truest and most exact application when the mind is engaged in the contemplation of true being?

Protarchus:: Certainly.

Socrates:: And these were the names which I adduced of the rivals of pleasure?

Protarchus:: Very true, Socrates.

Socrates:: In the next place, as to the mixture, here are the ingredients, pleasure and wisdom, and we may be compared to artists who have their materials ready to their hands.

Protarchus:: Yes.

Socrates:: And now we must begin to mix them?

Protarchus:: By all means.

Socrates:: But had we not better have a preliminary word and refresh our memories?

Protarchus:: Of what?

Socrates:: Of that which I have already mentioned. Well says the proverb, that we ought to repeat twice and even thrice that which is good.

Protarchus:: Certainly.

Socrates:: Well then, by Zeus, let us proceed, and I will make what I believe to be a fair summary of the argument.

Protarchus:: Let me hear.

Socrates:: Philebus says that pleasure is the true end of all living beings, at which all ought to aim, and moreover that it is the chief good of all, and that the two names ‘good’ and ‘pleasant’ are correctly given to one thing and one nature; Socrates, on the other hand, begins by denying this, and further says, that in nature as in name they are two, and that wisdom partakes more than pleasure of the good. Is not and was not this what we were saying, Protarchus?

Protarchus:: Certainly.

Socrates:: And is there not and was there not a further point which was conceded between us?

Protarchus:: What was it?

Socrates:: That the good differs from all other things.

Protarchus:: In what respect?

Socrates:: In that the being who possesses good always everywhere and in all things has the most perfect sufficiency, and is never in need of anything else.

Protarchus:: Exactly.

Socrates:: And did we not endeavor to make an imaginary separation of wisdom and pleasure, assigning to each a distinct life, so that pleasure was wholly excluded from wisdom, and wisdom in like manner had no part whatever in pleasure?

Protarchus:: We did.

Socrates:: And did we think that either of them alone would be sufficient?

Protarchus:: Certainly not.

Socrates:: And if we erred in any point, then let any one who will, take up the enquiry again and set us right; and assuming memory and wisdom and knowledge and true opinion to belong to the same class, let him consider whether he would desire to possess or acquire,—I will not say pleasure, however abundant or intense, if he has no real perception that he is pleased, nor any consciousness of what he feels, nor any recollection, however momentary, of the feeling,—but would he desire to have anything at all, if these faculties were wanting to him? And about wisdom I ask the same question; can you conceive that any one would choose to have all wisdom absolutely devoid of pleasure, rather than with a certain degree of pleasure, or all pleasure devoid of wisdom, rather than with a certain degree of wisdom?

Protarchus:: Certainly not, Socrates; but why repeat such questions any more?

Socrates:: Then the perfect and universally eligible and entirely good cannot possibly be either of them?

Protarchus:: Impossible.

Socrates:: Then now we must ascertain the nature of the good more or less accurately, in order, as we were saying, that the second place may be duly assigned?

Protarchus:: Right.

Socrates:: Have we not found a road which leads towards the good?

Protarchus:: What road?

Socrates:: Supposing that a man had to be found, and you could discover in what house he lived, would not that be a great step towards the discovery of the man himself?

Protarchus:: Certainly.

Socrates:: And now reason intimates to us, as at our first beginning, that we should seek the good, not in the unmixed life but in the mixed.

Protarchus:: True.

Socrates:: There is greater hope of finding that which we are seeking in the life which is well mixed than in that which is not?

Protarchus:: Far greater.

Socrates:: Then now let us mingle, Protarchus, at the same time offering up a prayer to Dionysus or Hephaestus, or whoever is the god who presides over the ceremony of mingling.

Protarchus:: By all means.

Socrates:: Are not we the cup-bearers? and here are two fountains which are flowing at our side: one, which is pleasure, may be likened to a fountain of honey; the other, wisdom, a sober draught in which no wine mingles, is of water unpleasant but healthful; out of these we must seek to make the fairest of all possible mixtures.

Protarchus:: Certainly.

Socrates:: Tell me first;—should we be most likely to succeed if we mingled every sort of pleasure with every sort of wisdom?

Protarchus:: Perhaps we might.

Socrates:: But I should be afraid of the risk, and I think that I can show a safer plan.

Protarchus:: What is it?

Socrates:: One pleasure was supposed by us to be truer than another, and one art to be more exact than another.

Protarchus:: Certainly.

Socrates:: There was also supposed to be a difference in sciences; some of them regarding only the transient and perishing, and others the permanent and imperishable and everlasting and immutable; and when judged by the standard of truth, the latter, as we thought, were truer than the former.

Protarchus:: Very good and right.

Socrates:: If, then, we were to begin by mingling the sections of each class which have the most of truth, will not the union suffice to give us the loveliest of lives, or shall we still want some elements of another kind?

Protarchus:: I think that we ought to do what you suggest.

Socrates:: Let us suppose a man who understands justice, and has reason as well as understanding about the true nature of this and of all other things.

Protarchus:: We will suppose such a man.

Socrates:: Will he have enough of knowledge if he is acquainted only with the divine circle and sphere, and knows nothing of our human spheres and circles, but uses only divine circles and measures in the building of a house?

Protarchus:: The knowledge which is only superhuman, Socrates, is ridiculous in man.

Socrates:: What do you mean? Do you mean that you are to throw into the cup and mingle the impure and uncertain art which uses the false measure and the false circle?

Protarchus:: Yes, we must, if any of us is ever to find his way home.

Socrates:: And am I to include music, which, as I was saying just now, is full of guesswork and imitation, and is wanting in purity?

Protarchus:: Yes, I think that you must, if human life is to be a life at all.

Socrates:: Well, then, suppose that I give way, and, like a doorkeeper who is pushed and overborne by the mob, I open the door wide, and let knowledge of every sort stream in, and the pure mingle with the impure?

Protarchus:: I do not know, Socrates, that any great harm would come of having them all, if only you have the first sort.

Socrates:: Well, then, shall I let them all flow into what Homer poetically terms ‘a meeting of the waters’?

Protarchus:: By all means.

Socrates:: There—I have let them in, and now I must return to the fountain of pleasure. For we were not permitted to begin by mingling in a single stream the true portions of both according to our original intention; but the love of all knowledge constrained us to let all the sciences flow in together before the pleasures.

Protarchus:: Quite true.

Socrates:: And now the time has come for us to consider about the pleasures also, whether we shall in like manner let them go all at once, or at first only the true ones.

Protarchus:: It will be by far the safer course to let flow the true ones first.

Socrates:: Let them flow, then; and now, if there are any necessary pleasures, as there were arts and sciences necessary, must we not mingle them?

Protarchus:: Yes; the necessary pleasures should certainly be allowed to mingle.

Socrates:: The knowledge of the arts has been admitted to be innocent and useful always; and if we say of pleasures in like manner that all of them are good and innocent for all of us at all times, we must let them all mingle?

Protarchus:: What shall we say about them, and what course shall we take?

Socrates:: Do not ask me, Protarchus; but ask the daughters of pleasure and wisdom to answer for themselves.

Protarchus:: How?

Socrates:: Tell us, O beloved—shall we call you pleasures or by some other name?—would you rather live with or without wisdom? I am of opinion that they would certainly answer as follows:

Protarchus:: How?

Socrates:: They would answer, as we said before, that for any single class to be left by itself pure and isolated is not good, nor altogether possible; and that if we are to make comparisons of one class with another and choose, there is no better companion than knowledge of things in general, and likewise the perfect knowledge, if that may be, of ourselves in every respect.

Protarchus:: And our answer will be:—In that ye have spoken well.

Socrates:: Very true. And now let us go back and interrogate wisdom and mind: Would you like to have any pleasures in the mixture? And they will reply:—'What pleasures do you mean?'

Protarchus:: Likely enough.

Socrates:: And we shall take up our parable and say: Do you wish to have the greatest and most vehement pleasures for your companions in addition to the true ones? 'Why, Socrates,' they will say, 'how can we? seeing that they are the source of ten thousand hindrances to us; they trouble the souls of men, which are our habitation, with their madness; they prevent us from coming to the birth, and are commonly the ruin of the children which are born to us, causing them to be forgotten and unheeded; but the true and pure pleasures, of which you spoke, know to be of our family, and also those pleasures which accompany health and temperance, and which every Virtue, like a goddess, has in her train to follow her about wherever she goes,—mingle these and not the others; there would be great want of sense in any one who desires to see a fair and perfect mixture, and to find in it what is the highest good in man and in the universe, and to divine what is the true form of good—there would be great want of sense in his allowing the pleasures, which are always in the company of folly and vice, to mingle with mind in the cup'—Is not this a very rational and suitable reply, which mind has made, both on her own behalf, as well as on the behalf of memory and true opinion?

Protarchus:: Most certainly.

Socrates:: And still there must be something more added, which is a necessary ingredient in every mixture.

Protarchus:: What is that?

Socrates:: Unless truth enter into the composition, nothing can truly be created or subsist.

Protarchus:: Impossible.

Socrates:: Quite impossible; and now you and Philebus must tell me whether anything is still wanting in the mixture, for to my way of thinking the argument is now completed, and may be compared to an incorporeal law, which is going to hold fair rule over a living body.

Protarchus:: I agree with you, Socrates.

Socrates:: And may we not say with reason that we are now at the vestibule of the habitation of the good?

Protarchus:: I think that we are.

Socrates:: What, then, is there in the mixture which is most precious, and which is the principal cause why such a state is universally beloved by all? When we have discovered it, we will proceed to ask whether this omnipresent nature is more akin to pleasure or to mind.

Protarchus:: Quite right; in that way we shall be better able to judge.

Socrates:: And there is no difficulty in seeing the cause which renders any mixture either of the highest value or of none at all.

Protarchus:: What do you mean?

Socrates:: Every man knows it.

Protarchus:: What?

Socrates:: He knows that any want of measure and symmetry in any mixture whatever must always of necessity be fatal.

Protarchus:: Most true.

Socrates:: And now the power of the good has retired into the region of the beautiful; for measure and symmetry are beauty and virtue all the world over.

Protarchus:: True.

Socrates:: Also we said that truth was to form an element in the mixture.

Protarchus:: Certainly.

Socrates:: Then, if we are not able to hunt the good with one idea only, with three we may catch our prey; Beauty, Symmetry, Truth are the three, and these taken together we may regard as the single cause of the mixture, and the mixture as being good by reason of the infusion of them.

Protarchus:: Quite right.

Socrates:: And now, Protarchus, any man could decide well enough whether pleasure or wisdom is more akin to the highest good, and more honorable among gods and men.

Protarchus:: Clearly, and yet perhaps the argument had better be pursued to the end.

Socrates:: We must take each of them separately in their relation to pleasure and mind, and pronounce upon them; for we ought to see to which of the two they are severally most akin.

Protarchus:: You are speaking of beauty, truth, and measure?

Socrates:: Yes, Protarchus, take truth first, and, after passing in review mind, truth, pleasure, pause awhile and make answer to yourself,—as to whether pleasure or mind is more akin to truth.

Protarchus:: There is no need to pause, for the difference between them is palpable; pleasure is the veriest impostor in the world; and it is said that in the pleasures of love, which appear to be the greatest, perjury is excused by the gods; for pleasures, like children, have not the least particle of reason in them; whereas mind is either the same as truth, or the most like truth, and the truest.

Socrates:: Shall we next consider measure, in like manner, and ask whether pleasure has more of this than wisdom, or wisdom than pleasure?

Protarchus:: Here is another question which may be easily answered; for I imagine that nothing can ever be more immoderate than the transports of pleasure, or more in conformity with measure than mind and knowledge.

Socrates:: Very good; but there still remains the third test: Has mind a greater share of beauty than pleasure, and is mind or pleasure the fairer of the two?

Protarchus:: No one, Socrates, either awake or dreaming, ever saw or imagined mind or wisdom to be in aught unseemly, at any time, past, present, or future.

Socrates:: Right.

Protarchus:: But when we see some one indulging in pleasures, perhaps in the greatest of pleasures, the ridiculous or disgraceful nature of the action makes us ashamed; and so we put them out of sight, and consign them to darkness, under the idea that they ought not to meet the eye of day.

Socrates:: Then, Protarchus, you will proclaim everywhere, by word of mouth to this company, and by messengers bearing the tidings far and wide, that pleasure is not the first of possessions, nor yet the second, but that in measure, and the mean, and the suitable, and the like, the eternal nature has been found.

Protarchus:: Yes, that seems to be the result of what has been now said.

Socrates:: In the second class is contained the symmetrical and beautiful and perfect or sufficient, and all which are of that family.

Protarchus:: True.

Socrates:: And if you reckon in the third class mind and wisdom, you will not be far wrong, if I divine aright.

Protarchus:: I dare say.

Socrates:: And would you not put in the fourth class the goods which we were affirming to appertain specially to the soul—sciences and arts and true opinions as we called them? These come after the third class, and form the fourth, as they are certainly more akin to good than pleasure is.

Protarchus:: Surely.

Socrates:: The fifth class are the pleasures which were defined by us as painless, being the pure pleasures of the soul herself, as we termed them, which accompany, some the sciences, and some the senses.

Protarchus:: Perhaps.

Socrates:: And now, as Orpheus says;

> 'With the sixth generation cease the glory of my song.'

Here, at the sixth award, let us make an end; all that remains is to set the crown on our discourse.

Protarchus:: True.

Socrates:: Then let us sum up and reassert what has been said, thus offering the third libation to the savior Zeus.

Protarchus:: How?

Socrates:: Philebus affirmed that pleasure was always and absolutely the good.

Protarchus:: I understand; this third libation, Socrates, of which you spoke, meant a recapitulation.

Socrates:: Yes, but listen to the sequel; convinced of what I have just been saying, and feeling indignant at the doctrine, which is maintained, not by Philebus only, but by thousands of others, I affirmed that mind was far better and far more excellent, as an element of human life, than pleasure.

Protarchus:: True.

Socrates:: But, suspecting that there were other things which were also better, I went on to say that if there was anything better than either, then I would claim the second place for mind over pleasure, and pleasure would lose the second place as well as the first.

Protarchus:: You did.

Socrates:: Nothing could be more satisfactorily shown than the unsatisfactory nature of both of them.

Protarchus:: Very true.

Socrates:: The claims both of pleasure and mind to be the absolute good have been entirely disproven in this argument, because they are both wanting in self-sufficiency and also in adequacy and perfection.

Protarchus:: Most true.

Socrates:: But, though they must both resign in favor of another, mind is ten thousand times nearer and more akin to the nature of the conqueror than pleasure.

Protarchus:: Certainly.

Socrates:: And, according to the judgment which has now been given, pleasure will rank fifth.

Protarchus:: True.

Socrates:: But not first; no, not even if all the oxen and horses and animals in the world by their pursuit of enjoyment proclaim her to be so;—although the many trusting in them, as diviners trust in birds, determine that pleasures make up the good of life, and deem the lusts of animals to be better witnesses than the inspirations of divine philosophy.

Protarchus:: And now, Socrates, we tell you that the truth of what you have been saying is approved by the judgment of all of us.

Socrates:: And will you let me go?

Protarchus:: There is a little which yet remains, and I will remind you of it, for I am sure that you will not be the first to go away from an argument.

# Philebus.

Translated by F. A. Paley.

Socrates, Protarchus, Philebus

Socrates:: Mind, now, Protarchus, what argument you are going to take up from Philebus on the present occasion, and against what on my part you are going to dispute, if it should not suit your own view when fairly put before you. What say you to our making a general summary of each?

Protarchus:: By all means.

Socrates:: Well then, Protarchus says that gratification,—that is, their pleasure and delight, and other emotions of that sort in harmony with them,—is regarded as good by all creatures. And our contention on the other side is, that good does not consist in these; but sense, mind, memory, and the mental qualities allied to them,—right judgment and true reasonings,—that all such qualities are better than and therefore preferable to mere pleasure at least, to all creatures that are capable of taking part in them; and to those that are so, it is and ever will be the most useful thing in the world. Is it not in some such form as this that we state our case on each side, Philebus?

Philebus:: Quite as you have put it, Socrates.

Socrates:: Such then is the proposition, Protarchus, that is now offered to you. Do you accept it?

Protarchus:: I am obliged to do so; Philebus (pretty fellow that he is) has given it up.

Socrates:: On matters so important then the truth should somehow be arrived at by every means in our power. "What say you?

Protarchus:: I certainly think so.

Socrates:: Come then, besides these concessions, let as come to an agreement between us on another matter also.

Protarchus:: "What is that?

Socrates:: That, as Philebus has now given it up, each of us shall try to show Some particular state and disposition of mind that is able to make life happy for all mankind. Is not this the course we should pursue?

Protarchus:: Certainly it is.

Socrates:: Very well, then: your party says it is the state of enjoyment, and my party says it is that of intellectuality.

Protarchus:: Yes, that is so.

Socrates:: But what if yet another habit of mind should be made clear to us, better than both of these; should we not say,—supposing this should appear to be more nearly allied to pleasure,—that though, of course, both our claims must yield to the life which contains these conditions of happiness in a manner likely to last,—yet the life of pleasure will have the advantage over that of intellect?

Protarchus:: Yes.

Socrates:: But, if more nearly allied to intellect, then intellect beats pleasure, and pleasure is beaten. Do you admit these conclusions, or how say you?

Protarchus:: For my own part, I do.

Socrates:: What then does Philebus think? Come, what say you?

Philebus:: Oh, I think, and ever shall think, that under all possible circumstances pleasure stands first! As for you, Protarchus, you must decide for yourself.

Protarchus:: Remember, Philebus, you resigned the argument to us, and you can hare no further right to express your agreement with Socrates, or the contrary.

Philebus:: What you state is true. I only mean to say, that I make my peace with pleasure, and now appeal to the goddess herself (that I advocate her cause).

Protarchus:: Then Socrates and the rest of us will join in attesting to her that you said what you say. However, the considerations that follow next upon these premises let us try to bring to a conclusion any how, whether Philebus approves of our view or whatever he may think of it.

Socrates:: We must try then, commencing with the goddess herself, who, as our friend here says, is known to all under the name of Aphrodite, though the most proper name for her is Pleasure.

Protarchus:: Most true.

Socrates:: The awe which always feel, Protarchus, in mentioning the gods by name is not a mere human sentiment, but goes far beyond the greatest fear. So now I give to Aphrodite any name that may be pleasing to that goddess. But I am quite aware that pleasure Ls a Proteus that assumes many aspects; and, as I said, if we begin with her we are bound to consider well and see what kind of nature she has. For though Pleasure is, so far as mere name goes, abstractedly one, yet we all know that it takes forms many and varied, and in some sense, unlike to each other. For observe: we talk of the pleasures of the dissolute man; the pleasure that a sober man takes in the mere fact of his soberness; the pleasures of one who talks nonsense, and is brimful of nonsensical notions and hopes; the pleasures again that the Thinker takes in the act of thinking; and if we venture to say that these two classes of pleasures are like each other, surely we shall justly be thought to have very little sense ourselves.

Protarchus:: Very true, Socrates; but that is because these pleasures that you enumerate come from things that are opposite; yet it does not follow that the pleasures themselves are opposed to each other. For how can pleasure be anything else than as like as possible to pleasure,—the thing itself to itself?

Socrates:: Well, my good friend, so is color as like as possible to color; so far as the mere fact is concerned, there will be no difference as to its being all color. But we all know that black, besides being different from, is also most directly opposed to white. And so indeed is shape most like to shape, for the matter of that. It is all one in kind; but, parts compared with parts, some of them are most directly opposite to each other, and others, we know, have a very wide difference. Many other things too we shall find in the same position; so that you must rot too far trust this kind of argument, which classes all the most opposite things under one head. I am afraid, indeed, that we shall find some pleasures to stand in direct opposition to others.

Protarchus:: Perhaps so; but what harm will that do to our argument?

Socrates:: Because, we shall reply, you call them, as being unlike by a wrong name. You assert that all that is pleasant is also good. Now, that things pleasant are pleasant, no reasoner denies; but, though some of thorn,—the greater part, I fear,—are bad, and some, as we admit, good, you call them all 'good,' though you are willing to allow that the pleasures themselves are unlike, if one should press you hard in the argument. What one condition or quality, then, is there in the bad and the good pleasures alike, that makes you say all pleasures are a good?

Protarchus:: What, Socrates! Do you think any man would grant, when he has taken as his axiom that 'Pleasure is the Chief Good,'—I say, do you suppose that any one will tolerate your assertion, that some pleasures only are good, and that there are some others which are bad?

Socrates:: Well, you will at least allow that pleasures are unlike each other, and some even contrary.

Protarchus:: No, not in so far as they are pleasures.

Socrates:: We come back to the same assertion, my Protarchus. For if so, we must say that neither is pleasure different from pleasure, but all are alike; and the instances just cited do not affect us at all. Thus we shall have to boar a defeat from making random assertions, like the weakest and most inexperienced of reasoners.

Protarchus:: What do you. mean?

Socrates:: Why, if I, following your example, and determined to fight it out, venture to assert that nothing is so like its opposite as what is most unlike it, I shall be able to avail myself of your argument of 'it's all the same.' And thus we shall prove ourselves to be rather too young, and our reasoning will drift out of its course and be lost. So let us beat back, and perhaps if we start again from the point we began with, we may hope to come to an understanding with each other.

Protarchus:: Tell me how you mean.

Socrates:: Conceive me again questioned by you, Protarchus.

Protarchus:: On what point?

Socrates:: Whether intellect, exact knowledge, mind, and all those qualities which I at first assumed in my thesis as 'good,' when I was asked what 'The Good' can be,—will not be open to the very same conclusions as your argument about pleasure.

Protarchus:: How so?

Socrates:: All the kinds of knowledge, taken together, will seem so many, that some of them must be unlike to each other. And if some are even in some way opposed, surely I should not deserve the name of a sound reasoner on the present occasion, if through fear of this result of ‘contraries,’ I were to assert that no one kind of knowledge is unlike another, and so were to let this argument be lost, as if it were mere idle talk, and we ourselves were to get safe to the shore on the plank of a paradox.

Protarchus:: "Well, certainly that must not happen,—except indeed the getting off safe. However, I like the fairness of terms presented by your argument and mine. Granted that pleasures are many and unlike, and the kinds of knowledge many and diverse.

Socrates:: This diversity then, Protarchus, in The good which you and I respectively advocate, I propose that we should try not to disguise or conceal. Let us rather bring it forward to the notice of all, and not shrink from the conclusion, if our arguments on being examined should give evidence to show conclusively whether we ought to call Pleasure ‘The Good.’ or Intellect, or some other third thing. For now, of course, we are not contending with this object, that my view, or your view, shall be the winner; both of us, I suppose, are bound to aid that cause which is the truest.

Protarchus:: Undoubtedly.

Socrates:: Then let us put this proposition on a still firmer footing by coming to an agreement upon it.

Protarchus:: What proposition?

Socrates:: One which causes much trouble to all, whether they like or (as is sometimes the case with some people) dislike it.

Protarchus:: Express yourself more clearly.

Socrates:: I mean, a proposition which has just now presented itself, by a kind of chance, to our notice, and the nature of ¦which is very strange; for it is strange, when so stated, that ‘Many are One’ and ‘One is Many’; and it is easy to argue against any one who takes either as his thesis.

Protarchus:: Is this then your meaning,—when somebody says that I, Protarchus, who am by nature one, and also on the other hand several, thus assuming that there are ever so many me’s, and some of them even contrary to each other,—the tall and the little, and the heavy and the light, in one and the same individual, and so on in numerous other relations?

Socrates:: What you have mentioned, Protarchus, is only the popular notion of the marvelous on the subject of the ‘One and Many.’ Such a notion now-a-days it is allowed, one might say, by all, that we ought not to take up; they regard it as puerile and obvious, and rather a hindrance than a help to argument. Indeed, they tell us that we should not entertain even such questions as this,—as when some one separately specifies the members or other parts of a particular thing, and then gets another to admit that all these members together form that original ‘One’; since he only laughs at him as he proves that he has been forced to make the portentous statements, that the One is many and infinite, and the Many but one!

Protarchus:: And pray what other kinds of ‘One and Many’ are there, which have not as yet been given up or become hackneyed on this same subject?

Socrates:: “When, my son, we apply this doctrine of Unity not to things that are born and die, as in the case we just now took,—for in this instance, and in Unity of this sort, as I just now said, it is generally admitted that we should not take up such a subject for inquiry;—but when one essays to view Man as One, or Ox, or Beauty or Goodness, it is about these and suchlike unities that all the pains are taken, with careful sub-division, and all the real difficulty is felt.

Protarchus:: In what respect?

Socrates:: In the first place, whether we must conceive that any such units have a real existence at all; in the next, in what sense, if each of these is One and ever the same, (that is, not admitting of either birth or destruction,) we can conceive it still in the most unchangeable manner to remain this One and no other; then, whether we are to assume such a unit as separated into many parts and dispersed through the infinity of things created, or existing as a whole outside of itself,—which, of course, would seem the greatest impossibility of all, that what is One and the same should at the same time be in One and in Many. These, Protarchus, are the cases of 'One and Many,' viz. in abstracts, and not in those others, the concretes, which are the causes of all perplexity, if not carefully defined and understood, and on the other hand, if they are so, a source of great facility and convenience.

Protarchus:: If so, Socrates, it is our duty first to work out this argument thoroughly in our present discussion.

Socrates:: I should myself certainly be inclined to say so.

Protarchus:: Then take it for granted that all of us, the present company, are willing to accept your views on these subjects. As for Philebus, indeed, it is best perhaps not to rouse him by putting any question, since he is well out of the discussion.

Socrates:: Very well, then. Where shall one take up the fight that has raged so long and with such different results on the matters in dispute? Shall we say at this point?

Protarchus:: Which?

Socrates:: We say, if I mistake not, that this same 'One and Many,' called into being by discussions, goes the round of every subject of conversation, whether new or old. And as this did not begin in our time, so there is no chance of its ever ceasing; but something of this sort, as it seems to me, is an unfailing and eternal property of the subjects themselves that arises in our minds. And when any of our young men on any occasion has first tried it, he is as delighted with it as if he had discovered a treasury of wisdom, nay, he is transported with pleasure, and would fain allow no subject to rest, at one time giving it a tern in this direction, and lumping it together into one, at another, pulling it to pieces again and separating it into parts, thus perplexing himself first and principally, and next, whoever happens to be near him at the time, whether younger or older or of the same age with himself. And in doing this he spares neither father nor mother nor any other of his hearers,—I might almost say, of the animals in general, and not merely the human kind. For, of course, he would not be likely to spare any of the foreign people, if he could but get some one to make them understand him.

Protarchus:: Do you not see, Socrates, how many we are, and that all of us are young? Have you no fear lest we should set upon you with Philebus, if you go on abusing us thus? However, we know what you mean; and if there is any way or any shift by which the confusion we are now in would good-naturedly go and leave the argument to ourselves, or if we could find any better way than this for discovering the truth, do you take up the cause with zeal, and we will go with you to the best of our power. For the subject before us is no trifling one, Socrates.

Socrates:: Indeed it is not, my dear boys, as Philebus styles you in his address. There is, however, no better way, nor is there ever likely to be, than the one of which have ever been an ardent admirer, though many a time ’ere now it has escaped from me and left me friendless and forlorn.

Protarchus:: What way is this? Only let us hear it.

Socrates:: It is one which it is not very difficult to make intelligible to you, but which it is very hard indeed to adopt. It is one by which all the discoveries that were ever made in art have become known to us. Now mind what way I am speaking of.

Protarchus:: Only tell us.

Socrates:: It was a gift of the gods to men, as it seems to me, that was flung down from some store-house in heaven by one Prometheus, together with very bright fire. And our fore-fathers,—better men than ourselves, and in closer converse with the gods,—have handed down to us this tradition, that all things which are said by us to le, are composed of both One and Many, and have in them the finite and the infinite as part of their nature. With this constitution then of things before us, it became our duty in all cases to propose to ourselves some one general view for investigation, since we are sure to find it at the bottom of every subject. When we have got hold of this, after one we should consider two, should there be two, or if not, then three, or some other number, and again each of these units in the same way, till we have clearly perceived the true nature of the original one, viz. not only that it is One and Many, and contains an indefinite number of parts, but also how many that can be counted up. But the note or character of infinity we must not apply to plurality, till one has fully seen all the number that plurality has between the original one and infinity. Then we may let each unit in them all pass into infinity, and concern ourselves no further with it. The gods then, as I said, so taught us to consider, to learn, and to inform each other. But the present degenerate race of philosophers arrive at the One and the Many too quickly and superficially; for after the One they immediately get to the Infinite, and take no account of intervening numbers. But it is in these very numbers that the difference consists between our conversing with each other like logicians, or on the other hand, like mere disputants.

Protarchus:: Some of these views of yours I think, Socrates, that I begin to understand; but on other points I should like to hear more plainly what you mean.

Socrates:: Well, what I mean is clear enough, surely, in the letters of the alphabet. You may therefore get an idea of it from the very rudiments of your own education.

Protarchus:: How so?

Socrates:: Articulate sound, you will grant, is one, as it proceeds from the mouth; and yet again it is infinite in the number of variations in each and from every individual.

Protarchus:: Certainly it is.

Socrates:: And yet we are not fully informed by knowing either of these facts, viz. that there is Infinity or that there is Oneness in sound. No; it is the knowledge of the number and nature of sounds that makes each of us a grammarian.

Protarchus:: Most true.

Socrates:: And surely what mates a man a musician is this very same knowledge.

Protarchus:: How so?

Socrates:: Sound, we said, according to the former science, is One in itself.

Protarchus:: Assuredly.

Socrates:: Now then let us assume two general kinds, the low-pitch and the high-pitch, and a third, the homotone, or note in unison. Is it not so?

Protarchus:: It is.

Socrates:: Well, but you would not as yet be an accomplished musician if you knew only these facts. While, if you did not know thorn, you would be, one might almost say, good for nothing in musical science.

Protarchus:: Assuredly so.

Socrates:: But when, my friend, have mastered the number and the nature of the Intervals in sound, in respect of treble and bass, and the limits of the intervals, and the combinations that are made from them, with a perfect knowledge of all which our predecessors taught us, their followers, to call them ‘harmonies’; when too, in the various movements of the body, you have discovered that other corresponding effects are produced, (which, numerically measured, they tell us we should call by other terms, ‘Time’ and ‘Meter’:) and when at the same time you begin to perceive that this is the view you ought to take about every ‘One and Many’;—when, I repeat, you have fairly realized all these facts and in this way, then you become an adept.; and when, by careful thought, you have apprehended any other truth, so too you are made intelligent in that. But this Infinity of number of and in each subject of thought makes you stray infinitely far from the right view, and does not allow you to become distinguished, or to make a figure in the world, as never having looked to any figures in anything.

Protarchus:: It seems to me, Philebus, that Socrates has admirably put what he has just now said.

Philebus:: So it seems to me also; as far as this subject goes. But why in the world is the argument addressed to us, and what is its purport?

Socrates:: That indeed, Protarchus, Philebus has very properly asked.

Protarchus:: He has, in sooth; and therefore do you answer him.

Socrates:: I will do so after a few more remarks on the subject itself. For as, when one has taken some one genus, he ought not, according to our view, to look at once to the nature of the Infinite, but to some number; so conversely, when one is obliged to take the Infinite first, he ought not to look to One immediately, but in this case too to a certain number containing in each term a certain plurality, and so try to take in that view, thus ending in One from all? But let us again illustrate our meaning by taking the case of letters.

Protarchus:: In what way?

Socrates:: When Voice was found to be unlimited,—whether it was a god who perceived this first or some god-like man, as there is a tradition in Egypt which says that it was Theufh; for he seems to have been the first to notice the vowel-sounds in that infinite, not as a One, but as a plurality, and again, other sounds, not of the vowel-kind, yet partaking of the nature of voice,' and to observe that these too had a certain number of their own; when moreover he had distinguished a third kind of letters which we now call mutes.—he next proceeded to class by themselves the consonants and the mutes, so far as to make each class One, and the vowels and the medials in the same way, until he had ascertained their precise number, and so gave the name of letter' to each and all the primary sounds. Seeing however that none of us would ever comprehend any one genus of sound by itself, and without them all, he again considered this group or combination a One, and as making all these various sounds One, and so sounded the praise of one art by calling it Grammar.

Philebus:: I understand this more clearly than your former remarks, Protarchus, to compare the statements themselves with each other. But the same defect seems to present itself in the argument as I felt some time ago.

Socrates:: Mean you, Philebus, again to ask, ‘What has this to do with the subject?

Philebus:: Aye, that is what Protarchus and I have been asking ourselves for some time.

Socrates:: And yet you have teen all the time close to what you say you have long been trying to find.

Philebus:: How is that?

Socrates:: Was it not Intellectuality and pleasure that we first undertook to discuss, in order to decide which of them we should prefer?

Philebus:: Certainly it was.

Socrates:: But we affirm, I think, that each of these is a One in itself.

Philebus:: "We do.

Socrates:: Well then, this is the very point that our former argument requires us to determine; first, how each of them is at the same time One and Many; next, how it is that they do not pass at once into infinity, but what number of parts each of them has, before they become infinite in their forms or manifestations.

Protarchus:: It is indeed no ordinary question, Philebus, that Socrates has somehow brought us into, by his roundabout introduction. And now it is for you to say which of us two is to answer what he now asks. It may perhaps seem ridiculous for me, who have engaged without any reserve to take up the argument from you, to impose it on you again from being myself unable to give a reply. But surely it is far more ridiculous that neither of us should be able. Consider therefore what we are to do. It seems to me that Socrates is now asking us about certain species of pleasure,—first, whether or not there are such; next, how many and of what kind. And similarly with respect to Intellectuality.

Socrates:: You say rightly, son of Callias. If we cannot give an answer on everything that has unity, similarity, and identity, i.e. on any Notion, and its contrary, the Many which it contains; it is plain from our former discussion that none of us is ever likely to become good for any thing on any subject whatever.

Protarchus:: This, Socrates, seems to me to be pretty nearly the ease. But, good as it is, in the opinion of a man of sense, to have a knowledge on subjects in general, the next best course is to be fully aware of one's own powers. Now what is the bearing of this remark on the present occasion? I will explain. You, Socrates, freely gave us all the opportunity of conversing with you, and your own services for defining what is the best of all human possessions. For when Philebus had stated this to consist in pleasure, delight, joy, and other emotions of that sort, you argued against this view, and insisted that the chief good did not lie in these, but in those other mental qualities which we so often purposely remind ourselves of, and very properly so, in order that each of these subjects may be kept before our minis and so be thoroughly sifted. Now what you say, as it appears to me, is the good which we shall properly call 'superior to pleasure at least,' is mind, science, intelligence, art, and all such kindred acquirements: that these are what we ought to acquire, and not those others. Well, when these two propositions had been severally stated and debated on in the former conversation, we, in joke, uttered this threat: ‘We won’t let you go, till a satisfactory conclusion has been reached by the determination of these questions.’ You agreed to this, and lent us your company for this purpose: and we, you see, affirm, as school-boys do, that a present rightly given cannot be taken away again. So do not go on meeting us at every point of the discussion in the way that you are doing.

Socrates:: What way do you mean?

Protarchus:: Why, throwing us into perplexity and asking such questions as we have no chance of properly answering at present. At present, I say; for let us not suppose that) even if we are all puzzled alike, the subjects now before us will come to a conclusion. No! if we cannot find an answer, you must; you promised. Therefore, take your own counsel in the matter, whether you will distinguish the kinds of pleasure and science, or give up classification, if there is any other way by which you are able and willing to make clear the present subject of discussion between us.

Socrates:: After such a speech as that there is no serious harm to be expected by my illustrious self; for that if you are willing is a phrase that removes all fear on any subject. But I have another motive for complying: it seems to me that some god has furnished us with a memory in this matter.

Protarchus:: How so? Memory of what?

Socrates:: It was a long time ago that I heard, and now bethink myself of it, in a dream or waking, some talk about pleasure and intellect,—that neither of these is the good, but some other third thing, different from them and better than both. Now surely, if this view should clearly present itself to us now, pleasure must resign all claim to the first prize; for the chief good can no longer be identical with pleasure. How say you?

Protarchus:: As you say.

Socrates:: Then, according to my view, we shall no longer require in addition the disquisitions necessary for distinguishing the kinds of pleasure. And this will appear still more clearly as we advance.

Protarchus:: You have said well; and conduct the discussion accordingly.

Socrates:: First, then, let us come to an agreement on some other minor points.

Protarchus:: "What are these?

Socrates:: Must the good have the condition of being final and complete, or is that not essential to it?

Protarchus:: I should say, Socrates, that if anything is an end in itself, it is the 'good.'

Socrates:: Well, is it also self-satisfying?

Protarchus:: Of course it is; it must surpass all other things in this respect.

Socrates:: But this, I presume, we are especially bound to say of it,—that every created thing that has any knowledge of it pursues and hankers after it, with an eager desire to get hold of it and to keep it for itself. Nay, it cares not in the least for anything else than what results in good.

Protarchus:: There is no gainsaying this.

Socrates:: Then let us consider and decide between the life of pleasure and the life of intelligence, viewing each separately.

Protarchus:: How do you mean?

Socrates:: Let there be no intelligence in the life of pleasure, and no pleasure in that of intelligence. For, if either of them is to be the good, it should, require nothing in addition. If it should appear that either one or the other does stand in need of anything else, it will cease, I presume, to be our real Good.

Protarchus:: Certainly it will.

Socrates:: Shall we try it in your own case, by way of testing these views?.

Protarchus:: By all means.

Socrates:: Answer then.

Protarchus:: Say on.

Socrates:: Would you, Protarchus, like to live your whole lifetime in the enjoyment of the greatest pleasures?

Protarchus:: Indeed, I should.

Socrates:: Would you then think that anything further was wanted, if you possessed this fully and entirely?

Protarchus:: Certainly not.

Socrates:: Mind, now. Do you really mean that you would not at all require thought, intelligence, right reason, and other faculties akin to these?

Protarchus:: Surely not. I should have everything, I take it, in having the feeling of joy.

Socrates:: Then if you lived thus you would always and throughout your life be in the enjoyment of the greatest pleasures.

Protarchus:: Of course.

Socrates:: But surely, if you had not mind, memory, knowledge, and right judgment, in the first place you would necessarily be ignorant about the very fact, whether you are or are not enjoying yourself,—I mean, if you are to be destitute of all intelligence.

Protarchus:: It could not be otherwise.

Socrates:: Well, but in the same manner if you did not possess memory, of course you could not even remember that you once felt pleasure; and no recollection at all would remain of the pleasure that occurred at the present time. So too, if you had not right opinion, you could not think you were rejoicing when you really were; if you had no reasoning power, you could not possibly calculate for the future either, whether you Trill fool joy. In a word, you. would have to live the life, not of a human creature, but of a jelly-fish, or some other of those living things with shelly bodies that inhabit the sea. Is this so, or can we form some other idea of the matter beside this?

Protarchus:: Certainly not.

Socrates:: Is then such a life as this worthy of our choice?

Protarchus:: This way of putting it, Socrates, makes me unable to give any reply at present.

Socrates:: Then do not let us give in just yet, but take on the other side the life of Mind, and see into that.

Protarchus:: What sort of life dc you. mean by that?

Socrates:: I mean to ask whether any one of us would on the other hand be content to live in the possession of intelligence, mind, and science, and with perfect recollection of everything, but without any share at all, either great or small, of pleasure, or on the other hand of pain, but with a complete absence of feeling in all such matters.

Protarchus:: Neither of these lives, Socrates, seems to me to be desirable; nor is it likely, as I think, to appear so to any one else.

Socrates:: But what shall we say, Protarchus, of the two together,—of the life that is common by being made up of both?

Protarchus:: You mean, of pleasure and mind or intellect?

Socrates:: That is the kind of life I allude to.

Protarchus:: Why any one, of course, will choose this in preference to either of the others; and not only any one, but every one.

Socrates:: Do we then begin to see what is the result that we are coming to in the present argument?

Protarchus:: Certainly: that three kinds of life are proposed for our choice, but of two of these neither is sufficient in itself, nor choice worthy for man or any other creature.

Socrates:: Then about these, at least, it is now clear that neither contains the Good. For in that case it would have been sufficient, and final, and choice-worthy to all plants and animals, that could so live during their whole term of existence. And if any of us made any other choice, it would be contrary to the nature of the really desirable; he would accept it without full conviction, either from ignorance or from a constraint very far removed from happiness.

Protarchus:: Well, it does seem that this is so.

Socrates:: Then I think we have proved to your satisfaction that Philebus' goddess, at least, cannot be regarded by us as identical with the Good.

Philebus:: For the matter of that, Socrates, neither is that mind of yours the good. If I mistake not, the same objections can be brought against it.

Socrates:: Perhaps they may, Philebus, against my mind, though not, I think, against the genuine godlike mind, which is quite another thing. As yet, then, I put in no claim for the first prize on behalf of mind as against the common or mixed life. But we have still to see and consider what is to be done about the second prize. For it is possible that one of us may say, that the reason why the mixed life is desirable is because it contains mind; the other, because it contains pleasure. And thus, though neither mind nor pleasure is the good in itself, it may still be thought that one or the other of them is the cause of good in the joint life. On this point then I would yet more strongly maintain against Philebus, that in this mixed life, whatever the quality or condition is, by the reception of which it is made at once desirable and good, to that quality not pleasure, but mind is more akin and more like. And so, according to this view, pleasure cannot justly be said to have any better claims even to the second prize than it has to the first. Nay, its place is further off than even the third, if this 'mind' of mine can be trusted by us in this discussion.

Protarchus:: 'Well, certainly, Socrates, pleasure does seem to me to have been fairly knocked down by the present argument; for it was in fighting for the first prize that it met with an overthrow. As for intellect, I suppose we must say it showed its good sense in not putting in its claim to the first prize; for it would have met with no better fate. But I am afraid that if pleasure loses the second prize, it will be held by its admirers to have downright disgraced itself. For not even they will any longer think it as beautiful as it seemed before.

Socrates:: Well, had we not better let her alone now, and not vex her by applying the most accurate test of all, and so proving her inferiority?

Protarchus:: That is all nonsense, Socrates.

Socrates:: What! because I said what was impossible, 'to give pleasure pain'?

Protarchus:: Yes; and not only so, but because you seem not to be aware that not one of us intends to let you go yet, before you have got to the end of these difficulties by reasoning them out.

Socrates:: Then, Protarchus, alack for the long dreary talk that remains! Put in fact, it is by no means easy at present to finish the discussion. If I mistake not, you require some other shift. If you go in for the second prize on behalf of mind, you must have weapons different from your former arguments. Some of them indeed, it may be, are the same. Must we then proceed.

Protarchus:: By all means.

Socrates:: But lot us try to use mutual caution in laying down its first principle.

Protarchus:: What principle do you mean?

Socrates:: Let us divide all things in creation into two classes,—or rather, if you please, into three.

Protarchus:: Explain how you mean.

Socrates:: Let us take as examples some points in our late discussions.

Protarchus:: Which points?

Socrates:: We said, if I mistake not, that the god had shown to mankind that there was both an Infinite in things, and also a Finite.

Protarchus:: Certainly.

Socrates:: Let us then assume these as two of the classes, and a third as a One made up of them both.—But I am, as it seems, myself sufficiently ridiculous in my attempt to divide and count up by classes.

Protarchus:: What mean you, my good friend?

Socrates:: Why, that we require yet a fourth kind.

Protarchus:: Tell us what.

Socrates:: Consider what can be the cause of this blending the infinite and the finite, and set down this as a fourth in addition to the other three.

Protarchus:: Don’t you think you will require a fifth also, implying the principle of separation?

Socrates:: Possibly: but not, I think, just yet. If we should require it, you, no doubt, will make due allowance for me in seeking for a fifth.

Protarchus:: Of course.

Socrates:: First, then, let us separately take three of the four, and endeavor, with respect to two of them, by viewing each, when split up and divided, as many, and then again uniting the parts of each into one, to comprehend how each of them is, as we said, One and Many.

Protarchus:: If you would speak a little plainer about them, perhaps I might follow you.

Socrates:: I mean by the two that I now put forward first, those which I just before named, the Infinite and the Limited. And that, in some sense, the Infinite is not only One but Many, I will try to show. As for the Limited, that must await our convenience.

Protarchus:: It shall do so.

Socrates:: Sow consider. I warn you that what I ask you to think about is difficult and open to dispute, but think. And first, with respect to ‘hotter’ and ‘colder’; can you conceive any limit to them? Or must we rather say that the qualities of ‘more’ or ‘less,’ residing in the very nature of the things themselves, will never allow a limit to be placed to them, so long as they are so resident? For, of course, if an end or limit is put to them, the ‘more and the less’ themselves come to an end.

Protarchus:: What you say is very true.

Socrates:: And we further say that in ‘hotter’ and ‘colder’ this ‘more’ and ‘less’ is invariably found.

Protarchus:: Most certainly.

Socrates:: Then our argument goes to show that these are always without a limit; and if they have no limit, then they are, of course, altogether infinite.

Protarchus:: I fully agree.

Socrates:: And you have well reminded me by your reply, that this very word ‘fully’ which you have uttered, and indeed a ‘gentle’ utterance also, have the very same force as ‘more’ and ‘less.’ For wherever they come in, they prevent a thing from being of definite proportion; and so by producing in all actions a more vehement than some previous more gentle, and the converse, they in effect make up a ‘more’ and a ‘less,’ and get rid of definite quantity. For, as we said just now, if they did not get rid of this definite proportion, but allowed not only it, but the measurable to have existence in the place of the more and the less, and the violent and the gentle,—if so, I say, these infinites are driven from their rightful place, which they hitherto occupied; since they could no longer be ‘more hot’ or ‘more cold,’ if they admitted definite quantity. For the very notion of ‘hotter,’ as well as of ‘colder,’ is progressive; while ‘only so hot or cold’ stops there, and ceases to advance. According to this argument then, the ‘hotter’ would at the same time be finite and infinite.

Protarchus:: It certainly seems so, Socrates; but, as you remarked, these inquiries are not easy to follow. Perhaps, if on some future occasion they are again proposed to our notice, they will show that the questioner and the questioned do not differ materially in their views.

Socrates:: There you speak well, and we will endeavor so to act. At present, however, consider whether we are to accept this proof of the nature of the infinite, that we may not protract the discussion too far by going at length into every point.

Protarchus:: Well, what proof do you allude to?

Socrates:: Whatever things appear to us capable of becoming more or less,—that is, to admit of violent, or gentle, and excessive, and all such qualities as these,—all these we should put in the category of the infinite, as class One, according to our former argument by which we said, if you remember, that we should bring under one head things that have been divided and dispersed, and mark them as terming one natural genus, according to their peculiar property.

Protarchus:: I remember it.

Socrates:: Then whatever does not admit of the above conditions, but does admit their opposites,—first, of the equal and equality, next to the equal, of the double, and everything which is either number in relation to some other number, or measure with another measure,—all things of this sort, I say, we should seem to be doing right in putting down in the class of the finite. How say you to this?

Protarchus:: Your division is an excellent one, Socrates.

Socrates:: Very well. But what character must we assign to the third,—that, I mean, which is made up of both finite and infinite?

Protarchus:: It will be for you, I expect, to tell me that.

Socrates:: Say rather some god, if any god condescends to hear my prayers.

Protarchus:: Make your prayer then, and look out for divine aid.

Socrates:: That I am doing; and indeed it seems to me that some god has already become our friend.

Protarchus:: How mean you, and what proof have you?

Socrates:: I shall explain, of course,—and mind you follow my argument closely.

Protarchus:: Only state it.

Socrates:: We spoke of a 'hotter' just now, I think, and a 'colder,' did we not?

Protarchus:: We did.

Socrates:: Add to them then degrees of wet and dry, much and little, quick and slow, great and small, and all such qualities as we before set down under one head, as a class of things naturally admitting of a 'more' and a 'less.'

Protarchus:: That of the Infinite, you mean?

Socrates:: I do. And now bring into connection with it, as the next step, the family of those things which, on the other hand, admit of the finite.

Protarchus:: What class is that?

Socrates:: The class of things which we ought to have united under one genus of the finite kind, but did not do so, as we did to that of the Infinite. Perhaps, however, it will do as well even now; by bringing both into a class of their own, the third kind will also become plain to us.

Protarchus:: What class, I repeat, and how do you moan?

Socrates:: The class of the equal and the double, and generally of that which stops contraries from remaining at variance with each other, and makes them commensurable and in harmony by introducing number.

Protarchus:: I understand you. You seem to me to mean, by proposing to unite these, that certain products will result in each of them.

Socrates:: You are right in your supposition.

Protarchus:: Go on, then.

Socrates:: Is it not, in the case of diseases, the right union of these opposite principles which produces the natural state of health?

Protarchus:: Certainly it is.

Socrates:: And in treble and bass, quick and slow time, which are in themselves infinite, the introduction of the same limiting agents produces the finite, and the most perfect musical composition generally.

Protarchus:: Yes, and with the most charming effects.

Socrates:: Well, you will also grant that, in seasons of too great cold or heat, the same agents come in and take away the excessive and the infinite, and produce an internal and external agreement.

Protarchus:: Of course.

Socrates:: Is it not then by these that seasonable weather and all else that is enjoyable are brought into existence for us, that is to say, from the limiting influences in union with the unlimited?

Protarchus:: Undoubtedly.

Socrates:: And there are other similar results without number, of which I say nothing, such as the beauty and strength that attend health, besides many other admirable mental qualities. It was this goddess Harmony, my handsome friend Philebus, that first saw riot and the general badness of all men, and when no moderation was to be found among them either in their pleasures or in their surfeits, she enacted Law and Order, which brought with them Limit. And you, Philebus, say that she utterly spoils life; I, on the contrary, say that she preserves it. What do you, Protarchus, think of her?

Protarchus:: That, Socrates, is quite my view of the matter.

Socrates:: Now, then, I have described these three classes, if you understand me.

Protarchus:: Well, I think that I do. You seem to me to say that one of these is the Infinite, one, and next in order, the limiting principle, in. all existing things. As for the third, I do not quite comprehend what you mean by it.

Socrates:: I see, my friend; what puzzled you was the great number of the results produced by this third. But the Infinite also presented many kinds; and yet, as registered under the general class of 'the more and the less,' they all appeared to us as One.

Protarchus:: That is true.

Socrates:: But the Finite, as it had not so many forms, did not cause us the same difficulty in making it naturally One.

Protarchus:: How should it?

Socrates:: In no respect. Suppose me then to mean by the third,—putting in this class as one everything resulting from the union of the other two,—'Birth into Being from those medium states which, by union with the Finite, are brought about from the Infinite.'

Protarchus:: I understand you.

Socrates:: Well, but we said that besides these three a fourth class would have to be considered. In this consideration you must take a part. See now, whether you think it a necessary law, that 'Everything created is created by some Cause.'

Protarchus:: do. For how, without it, could anything be created at all?

Socrates:: Then the producer, in its true nature, differs not, except in name, from the cause; and thus 'what makes’ and ‘what causes’ would rightly be called one and the same thing.

Protarchus:: It would.

Socrates:: But again, ‘what is made’ and what is ‘brought into being’ we shall And to differ only in name, like the instance mentioned just above. What say you?

Protarchus:: As you say.

Socrates:: Does not then that which makes always naturally precede, and what is made come into existence subsequently to that?

Protarchus:: Undoubtedly.

Socrates:: Then ‘cause,’ and that which obeys cause for production, are by no means the same, but different.

Protarchus:: Of course.

Socrates:: Then the results produced, and the conditions from which all states are produced, present to us these three kinds?

Protarchus:: They do.

Socrates:: May we then call that which is the producer of all these results a fourth principle, viz. cause? For we have sufficiently shown that it is different from the others.

Protarchus:: It is different, certainly.

Socrates:: It is proper, however, now that the four have been distinguished, with a view to remembering each, to count them, up one after another.

Protarchus:: Of course.

Socrates:: Well, then; the first I call the Infinite, the second the Finite; next, and thirdly, existence resulting from a union of these two; and if I venture to call the cause of this ‘union and consequent production a fourth kind, I should not, I think, be unreasonable.

Protarchus:: Of course not.

Socrates:: Come then, what is the nest step in the argument? And with what object in view have we got so far? Was it not this: we were inquiring whether the second prize would fall to pleasure or to intellect. Was it not so?

Protarchus:: It was.

Socrates:: Then now that we have arrived at this classification, we are in a position to form a better opinion as to the result about the second as before about the first, for it was about these two first that, as you know, we raised a doubt.

Protarchus:: Perhaps so.

Socrates:: Now go on. We put down the mixed life, I think, of pleasure and intellect, as entitled to the first prize. Was it so?

Protarchus:: If was.

Socrates:: Very well. Then we now perceive what this mixed life is, and to what class it belongs.

Protarchus:: Assuredly.

Socrates:: And we shall further assert, if I mistake not, that it is but a part of a general third class; for that third is not made up of two particular things, but of all the infinites together tied down by a limiting influence. So that with perfect propriety this life that has got the first prize would be made but a part of that other more general one.

Protarchus:: Most properly so.

Socrates:: Very good. But what must we say, Philebus of your life, which, is wholly of pleasure unmixed with anything else? In what class of those described above must it be put to be rightly reckoned? And before you deliver your opinion, answer me on this! point.

Philebus:: You have only to say what.

Socrates:: Are pleasure and pain limited, or do they belong to the class of things that admit of a more and a less?

Philebus:: Certainly to those that allow a more. For pleasure would not be full and complete good, if it were not in its very nature unlimited both in quantity and in the power of becoming yet more.

Socrates:: Nor, Philebus, would pain be complete evil; so that we must look for some other agency than the nature of the Infinite, to account for a part of the good that pleasures possess. Let this therefore be taken by you as one of the points not yet fully determined. Put tell me, both Protarchus and Philebus, under which of the classes we have mentioned we are now to reckon intellect, knowledge, and mind, so as not to offend by our impiety? For, as it seems to me, the stake is by no means a small one between failure and success in the present inquiry.

Philebus:: Ah! you, Socrates, exaggerate the merits of your god.

Socrates:: 'Well, and so do you, my friend, those of yours. Nevertheless, it is our bounden duty to answer the question that is asked.

Protarchus:: Socrates is certainly right, Philebus, and we must do as he bids us.

Philebus:: You know that you have elected to speak for me.

Protarchus:: So I have: but at present I am well-nigh perplexed, and I want you, Socrates, to be our mouthpiece, in order that we may fall into no mistake respecting the rival divinity by giving utterance to some incongruous sentiment.

Socrates:: suppose I must comply, Protarchus; for after all, the task you impose is not very difficult. But tell me,—

did I really, by exaggerating, as Philebus said, my νους, in my joking way, cause you the perplexity you describe, in asking to what class Mind and Knowledge belonged?

Protarchus:: Indeed, Socrates, you did.

Socrates:: Well, there really was no difficulty. All philosophers agree,—making themselves in good earnest of great importance,—that mind is the ruling power of both heaven and earth. And perhaps they are right in the assertion. But let us, if you please, inquire somewhat more at length into this very subject, to what class mind belongs.

Protarchus:: Say on as you think proper, and do not concern yourself on our account about the length of the discussion. For be assured, Socrates, that we shall not quarrel with you on that account.

Socrates:: You say well. Let us then commence with some such question as this.

Protarchus:: As what?

Socrates:: Whether we are to that all existing things, and this fair scene which we call the Universe, are governed by the influence of the irrational, the random, and the mere chance; or, on the contrary, as our predecessors affirmed, are kept in their course by the control of mind and u certain wonderful regulating intelligence.

Protarchus:: None of these same [random principles that you mention], my respected friend Socrates; for what you have just suggested seems to me downright impious. But the doctrine that mind regulates them all is worthy of the grand spectacle of the universe, the sun, moon, stars, and all the revolving heavens; and for my own part, I am not the man ever to speak or even think about them in any other way.

Socrates:: Do you propose then that we on our parts should join in affirming a doctrine maintained by our predecessors, viz. that the facts are as just stated,—in other words, that we should not only think ourselves bound to quote, without risk on our side, the opinions of others, but should take the risk on ourselves, and share the blame that must fall on us when some able disputant asserts that the universe is not governed by any such law, but proceeds on no fixed principle.

Protarchus:: Certainly, I should be glad to do this.

Socrates:: Proceed then to consider the point that next suggests itself to us in the present discussion.

Protarchus:: You. have only to state it.

Socrates:: Those elements which are found in the nature of the bodies of all created things without exception,—fire, water, and air, we get a glimpse of, and land too, (as sailors say iii a storm,) as existing also in the constitution of the Universe.

Protarchus:: You may well use that expression; for we are in good earnest thrown out of our reckonings by the difficulties in our present subject.

Socrates:: And now further remark this about each of the component elements in us.

Protarchus:: What?

Socrates:: Why, that each of these elements in ourselves here on earth is small, insignificant, and existing by no means in a pure and genuine state, and that the power it possesses bears no proportion to the grandeur of its nature. Take a single element as an instance, and draw the same conclusion respecting them all. There is, you will grant, fire existing in ourselves, and also fire in the universe.

Protarchus:: Assuredly.

Socrates:: Then you will also grant that the are in us is small, weak, and of inferior power, while that in the universe is wonderful both in respect of quantity and beauty, and, indeed, in every property that fire can have.

Protarchus:: What you say is very true.

Socrates:: Well, now, is the fire of the universe fed, lit, and ruled by this.—I mean, by the fire that is resident with us on earth; or, on the contrary, is the fire in me, in you, and in all other creatures, possessed of all these conditions from the fire that is above us.

Protarchus:: That is a question that does not deserve an answer at all.

Socrates:: Well said; for the remark will equally apply, if I mistake not, to the element of earth subsisting in the creatures here, and that in the worlds without; and so, in fact, you will reply about all the other ingredients which I named in my questions a little before.

Protarchus:: No one who wishes to be thought sane can give any other answer.

Socrates:: No one, certainly. But now follow me in the next matter for consideration. All the elements we hare just enumerated we comprehended under one general view, and applied to them the term 'body.' Was it not so?

Protarchus:: Of course.

Socrates:: Take the same remark to apply to this that we call 'the universe.' For, of course, on the very same principle it must be a 'body,' since it is composed of the same elements.

Protarchus:: Nothing can be more true.

Socrates:: I want to know then, whether it is from this body, in its entirety, that our human bodies are supported, and have received and hold the other conditions that we stated respecting them, or from our bodies that this universe is maintained?

Protarchus:: This is another question, Socrates, that is hardly worth the asking.

Socrates:: Well, is this then worth,—or what will you say to it?

Protarchus:: Say what question you mean.

Socrates:: Shall we not affirm that this human body of ours possesses a soul?

Protarchus:: We certainly shall.

Socrates:: Then from what source, friend Protarchus, did it get it, unless indeed the body of the universe had a soul also r For the universe certainly has all the properties of our bodies, and those of a kind more beautiful in every respect.

Protarchus:: It is clear, Socrates, that our bodies have the animating principle from no other source.

Socrates:: True; we do not, of course, suppose, Protarchus, that the four kinds we mentioned, viz. the limiting, the unlimited, a kind made up of both, and a fourth representing Cause, which exists beside the others in all things,—that this fourth, I mean, which imparts life to the creatures we see, and enables them to exercise their bodies, and when those bodies receive any damage, provides a means of curing it,—that this, which in its arrangement and combination of various bodies and its healing powers is called perfect and universal wisdom,—that this, co-existing with the other like principles in the heavens as a whole, and in vast portions of them, and that too in a pure and perfect state, should not have been the contriver in the world without of Nature’s most beautiful and most highly prized works.

Protarchus:: Why certainly that would be quite unreasonable.

Socrates:: Then, if we should be wrong in this, we should perhaps state the case better by holding with that other conclusion, viz. that there are in the universal those principles we have so often specified,—the infinite, wide in its prevalence, the finite, sufficient to form with it a third, and besides these an almighty Cause, that orders and appoints years, seasons, and months, and which therefore would most justly be called Wisdom.

Protarchus:: Most justly indeed.

Socrates:: But wisdom and mind there never can be apart from soul.

Protarchus:: No, indeed.

Socrates:: You will allow then that in the nature of Zeus a kingly soul and a kingly mind are implanted, on account of its influence as a Cause; while other gods have other gifts and prerogatives, as they may severally please to have them called.

Protarchus:: Certainly.

Socrates:: Now don't suppose, Protarchus, that we have advanced this argument without due reason. It is in defense of those philosophers who long ago declared their conviction that Mind is ever the ruling principle in the Universe.

Protarchus:: Well, it certainly is in their favor.

Socrates:: And it is also one that has already provided an answer to my inquiry, by telling us that Mind is the real originator of that which we called 'Universal cause'; and this cause is one of the four kinds. So now, I think, you have got from us our reply.

Protarchus:: I have, and in a manner that quite satisfies me. And yet, I really was not aware that you had given your answer.

Socrates:: Why, sometimes a little pleasantry furnishes an agreeable rest from serious thought.

Protarchus:: Well said.

Socrates:: Then to what class, my friend, Mind belongs, and what property it possesses, has now been fairly well explained by us.

Protarchus:: Quite so.

Socrates:: But the class to which Pleasure belonged was in the same way ascertained some time ago.

Protarchus:: Assuredly.

Socrates:: Let us then keep in mind these facts among others, about both,—that Mind is, as we said, allied to Cause, and may be referred tolerably well to that class of things; whereas pleasure is not only in itself infinite, but of a kind that neither has nor ever can have beginning, middle, or end in itself or of itself.

Protarchus:: We shall remember that, of course.

Socrates:: Now then we are bound in the next place to see not only in what part of us each of them resides, but from what state or condition they are produced, when they exist at all. And first, of pleasure; as we took first for examination the class that it belonged to, so now let us take first these inquiries respecting it.—But here again I must remark, that we shall never be able to examine pleasure thoroughly, if we take it apart from pain.

Protarchus:: If that is the road we should pursue, by all means let us pursue it.

Socrates:: Have you then the same view as myself respecting the origin of them?

Protarchus:: What view is that?

Socrates:: It appears to me that pleasure and pain taken together belong naturally in their origin to the mixed class.

Protarchus:: Refresh our memories, dear Socrates, if you please, as to which of the before-mentioned classes you mean by ‘the mixed.’

Socrates:: That shall be done to the best of my power, my much esteemed friend.

Protarchus:: Thank you.

Socrates:: Well then, let us conceive by the term ‘mixed kind,’ that which we before said was the third of four.

Protarchus:: That which you mentioned next after the infinite and the finite? That in which you put health, and (if I mistake not) harmony also?

Socrates:: Well said. Anil now apply that ‘mind! of yours as well as you can.

Protarchus:: You have only to say on.

Socrates:: I say then that whenever we find this harmony violated in living things, a breaking up of the natural condition and a production of pains occur at that same time.

Protarchus:: What you say is quite reasonable.

Socrates:: But when the harmony is restored, and gets back into its normal state, we may say that then pleasure arises,—to use as few words and as brief an expression as is allowable on a subject of such importance.

Protarchus:: I dare say you are right, Socrates; but let us try and set these views in a yet clearer light.

Socrates:: Well then, it is easiest, I suppose, to comprehend common-place and obvious sensations.

Protarchus:: Of what kind?

Socrates:: Hunger, I presume, may be said to undo the harmony, and so to be a pain.

Protarchus:: It is so.

Socrates:: And eating, which is the filling up again of a void, is a pleasure.

Protarchus:: It is so.

Socrates:: And so again thirst is a spoiling of the harmony and a pain, ¦while the effect of liquid is to fill again what had lost its moisture, and so to cause pleasure. And still further, any secretion and dispersion of moisture that is unnatural to us, which are the effects of close heat, is a pain; while the restoring of it and cooling down again to a natural state, is a pleasure.

Protarchus:: Assuredly.

Socrates:: And the congealing of moisture by cold, beyond what is natural in an animal, is a pain, while the natural course of the moist particles, as they get back to their former state and become dissolved, is a pleasure. Or, to put the matter in one form, consider if the proposition be not a sound one, in respect of the particular class of things resulting, by the natural law of vital production, from the union of the infinite with the finite, as I before said,—that whenever this state suffers a break up, that breaking up is a pain, while the return to its own essential properties, in the going back of all the elements to their places, is on the other hand a pleasure.

Protarchus:: That may be granted: it appears to me to be probable in a general way.

Socrates:: Shall we then put down this as one kind of combined pleasure and pain in affections of this sort in each case?’

Protarchus:: So let it be considered.

Socrates:: Now then assume that, as an emotion of the mind alone,—i.e. in reference to the expectation of these feelings,—that the pleasure hoped for before the actual pleasure is felt, is pleasing and cheering, while the prospect before the actual pain felt is alarming and painful.

Protarchus:: Unquestionably, this is a second sort of combined pleasure and pain,—the feeling that is produced in the mind itself, through expectation, apart from the body.

Socrates:: You are right in your surmise, For in these expectances,—which, as I view it, are each wholly independent of body, and so unmixed with actual pain and pleasure,—I think that we shall find a clear proof, whether the class of pleasure, as a whole, is worthy of our chief regard as the good; or that is rather to be made over by us to some other of the fore-mentioned classes, while in respect of pleasure and pain,—just as ire might say of hot and cold, and all such natural conditions,—we must only occasionally take up with them, at other times rejecting them as not constituting the good in themselves, yet sometimes and in some particular instances admitting the nature of the good.

Protarchus:: You are quite right in saying that the object we are now in quest of has passed by some such track as that we are now upon.

Socrates:: Then first let us consider this: If what we have just said is really the case, viz. that from the disarrangement of the elements in us comes pain, but pleasure follows from their being got safely back again, let us, I say, proceed to contemplate the negative state, when there is no such disarrangement or consequent restoration, and see what ought to be the condition of living creatures under these circumstances. And now attend very carefully to the question and say, Is it not certain that at that particular time every creature must be without the sense of either pain or pleasure, either in a small or a great degree?

Protarchus:: It must certainly be so.

Socrates:: There is then, beside the other two, a disposition in us such as I have described; that is, beside that of a person in a state of joy, and that of one in pain.

Protarchus:: Of course.

Socrates:: Now, then, be careful to remember this; for in judging of pleasure the keeping clearly in mind or not this third state is a matter of great importance. And so, if you please, let us discuss one little point connected with it.

Protarchus:: It is for you to say what.

Socrates:: You are aware that if a man has chosen a life of intellect, there is no reason why he should not live always in this way.

Protarchus:: Do you mean that of having neither joy nor sorrow?

Socrates:: Yes. We said before, in our comparison of lives, that one who had chosen the life of thought and intellect need not feel pleasure in any degree, small or great.

Protarchus:: Certainly we affirmed that.

Socrates:: Very well; then this will be the life of the thinker; and perhaps of all lives it is the most god-like.

Protarchus:: Why, it certainly does not seem likely that the gods have any sense either of pleasure or pain.

Socrates:: Certainly it is not at all likely; either would be undignified if it did happen to them. However, this question we will consider on a future occasion, if it should serve our argument. We will assign this advantage to intellect for the second prize, if we should not be able to give it for the first.

Protarchus:: You say well.

Socrates:: But you will grant that the other kind of pleasure, viz. that which we said was purely mental, takes place in us solely through memory.

Protarchus:: How so?

Socrates:: It appears we must first take up afresh the subject of memory, and ascertain what that is. Nay, it may be that we ought even to make a preliminary inquiry Into sensation before 'memory,' if the arguments on this subject are to be properly made clear to our minds.

Protarchus:: How do you mean?

Socrates:: Assume that of the various bodily feelings that we from time to time experience, some stop at and cease in the body, before they reach the mind at all, and leave it wholly unaffected; while others go through both, and impart a thrill, as it were, at once peculiar to each and common to both.

Protarchus:: That may be conceded.

Socrates:: Then if we affirm that the sensations which do not pervade both do not gain the notice of the mind, while those which pervade both do obtain such, notice, we shall state the argument in its most correct form.

Protarchus:: Undoubtedly.

Socrates:: Now you are not to take my expression 'not gaining notice' as having anything to do in this particular case with the origination of forgetfulness. Forgetfulness is the departure of something that was retained in the mind. But that something in the case we now speak of has not yet existed; and to talk of there 'being a loss' of what neither is nor hitherto has been, is absurd. Is it not so?

Protarchus:: Of course.

Socrates:: Then all you have to do is to make a change in the terms.

Protarchus:: How?

Socrates:: Don't talk of the soul having 'no memory,' when she has no feeling of the bodily shocks; rather call that 'insensateness' which you are at present disposed to call 'forgetfulness.'

Protarchus:: I understand.

Socrates:: But that other emotion,—when the soul and the body in partnership with it is moved by one and the same feeling, and therefore has a part with it in the movement,—you may not unreasonably term sensation.'

Protarchus:: Nothing can be more true than this.

Socrates:: Now then we begin to understand what we mean by the term 'sensation'.

Protarchus:: Assuredly.

Socrates:: Well then, if any one chose to define memory 'the retention of an impression,' he would, in my judgment, speak correctly.

Protarchus:: Quite correctly.

Socrates:: But when we speak of recollection, we mean something different from mere memory; is it not so?

Protarchus:: Perhaps it is.

Socrates:: Is not this then also true?

Protarchus:: What?

Socrates:: When the mind recalls by itself,—as far as possible in itself,—feelings that it once shared with the body, then, I presume, we talk of its 'remembering' thorn. Do we not?

Protarchus:: We certainly do.

Socrates:: But surely there is another sort of memory. For when the soul has lost the remembrance of some former experience—be it of something felt or something learnt,—and afterwards goes over the same ground again in itself, all those results so regained we call 'recollections' and 'memories'.

Protarchus:: That is rightly stated.

Socrates:: The object then of all these preliminary remarks is this.

Protarchus:: What?

Socrates:: Why, that we might realize in the fullest and clearest manner the pleasure which the mind feels independently of that of the body, and at the same time, what we mean by 'desire.' For it is by such considerations, as it seems, that the nature of bodily pleasure and mental pleasure becomes known to us.

Protarchus:: Now then, Socrates, let us proceed to the next step in the discussion.

Socrates:: Indeed there are. many considerations about the origin of pleasure and its general aspect that we are bound to enter upon, as it seems. Even at the present point of the argument we should first, I suspect, take up yet another topic,—the nature of desire, and in what part of us it is felt.

Protarchus:: Let us, by all means, consider it; for we shall lose nothing by it.

Socrates:: Yes, we shall lose,—and that, Protarchus, by the finding of what we are now looking for,—the perplexity we have hitherto felt on these very subjects.

Protarchus:: You are right in your rejoinder.' However, let us proceed to the next point, and try to state what that is.

Socrates:: Well, did we not ray just now that hunger and thirst and many other sensations of the like kind were examples of desires?

Protarchus:: To be sure we did.

Socrates:: To what one character, then, or principle of identity, do we appeal when we call things so very different by the same name?

Protarchus:: Upon my word, Socrates, that may prove difficult. to answer; however, we must give some reply.

Socrates:: Then let us resume the discussion from the same examples.

Protarchus:: Which do you mean?

Socrates:: We say, you know, very often, 'he is thirsty'; and this must mean something.

Protarchus:: We do, of course.

Socrates:: And this means, in effect, 'he feels a void.'

Protarchus:: Certainly.

Socrates:: Well, is not this thirst a desire?

Protarchus:: It is, of drink.

Socrates:: Of drink, or of the satisfaction caused by drink?'

Protarchus:: Well, I suppose it is of the satisfaction.

Socrates:: It seems then that when any of us begins to feel a void, he desires something that is contrary to that feeling: he is getting empty, and he wants to get filled.

Protarchus:: Most clearly.

Socrates:: Very good. Now suppose a man feels that void for the first time: is there any conceivable source from which, either by the actual sensation of being satisfied or the memory of it, he could realize a feeling' that he is neither now conscious of nor has ever before been aware of?

Protarchus:: Of course not.

Socrates:: But surely he who desires must desire something, if language means anything.

Protarchus:: Without doubt.

Socrates:: Then he does not desire that which he feels; for he is thirsty, which is an exhaustion, but what he wants is a replenishing.

Protarchus:: Yes.

Socrates:: Then it must be some part of the thirsty man that in some way realizes repletion.

Protarchus:: It must.

Socrates:: It cannot be the body then; for that, you know, is suffering from a void.

Protarchus:: Yes.

Socrates:: It remains therefore for the mind to realize repletion, that is, of course, by an act of memory. For what else is there by which it could realize it?

Protarchus:: Hardly anything.

Socrates:: Do we now begin to see what result we have arrived at from these admissions?

Protarchus:: What is it?

Socrates:: Why, our present argument tends to prove that bodily desire can never take place in us.

Protarchus:: How can it prove that?

Socrates:: By showing that the effort of every creature is always in the contrary direction to the feelings of the body.

Protarchus:: It certainly is so.

Socrates:: But surely this impulse, leading as it does to something contrary to the actual feelings, shows that memory belongs to faculties opposite to those feelings.

Protarchus:: Certainly.

Socrates:: Then our reasoning, by proving that it is memory that leads us to the objects of our desire, makes it clear that all impulse and desire are mental, and also the governing principle of the whole living creature.

Protarchus:: Rightly said.

Socrates:: Then this same reasoning does not allow that it is the body which feels thirst or hunger, or has any sensations of this kind.

Protarchus:: Most true.

Socrates:: Now then let us further understand the following point on this same subject. It seems to me that our argument tends to show us a particular kind of life under such states and feelings.

Protarchus:: What states do you mean, and of what life are you speaking?

Socrates:: I mean the states of getting full and empty, and all others that are connected with the preservation of creatures or their impaired state,—m a word, when any of us, accordingly as he is placed in either of the said states, feels pain at the one, or pleasure at the other, according to the alternations he undergoes.

Protarchus:: That is so.

Socrates:: But what shall we say when he is between these two conditions?

Protarchus:: How between them?

Socrates:: Why, when he feels pain from his empty state, and has a recollection of former pleasures, knowing that by their occurrence he would now be relieved from his suffering, but as yet is not getting his fill. What are we to say of him then? That he is, or is not, between these two states?

Protarchus:: That he is.

Socrates:: With an entire feeling of pain, or one of pleasure?

Protarchus:: Not pleasure, certainly, but rather oppressed with a two-fold pain; bodily, in the actual suffering, mental, in a certain longing resulting from the expectation.

Socrates:: Are you sure you are right, Protarchus, in your view about a twofold pain? Does it not sometimes happen that one of us who is getting empty is so situated that he has a sure hope of being filled, and sometimes on the contrary he feels it to be quite hopeless?

Protarchus:: Quite so.

Socrates:: Then does it not seem to you that, so far as he hopes to be filled, he has pleasure at the memory of what he before was, while simultaneously, as he feels a void, he has pain at such times.

Protarchus:: It cannot be otherwise.

Socrates:: Then under these circumstances not only man but every other creature feels at the same moment both pain and pleasure.

Protarchus:: It seems so.

Socrates:: But what, when he has no hope at all that, in getting empty, he will have the means of getting full again? Is not this rather the case in which the double feeling of pain would occur? You perceived just now that there was such a feeling, but fancied it was simply double.

Protarchus:: Very true, Socrates.

Socrates:: Let us then employ this inquiry into these feelings for the following purpose.

Protarchus:: What is that?

Socrates:: Whether we are to call these combined pains and pleasures true or false; or some of them true, others not.

Protarchus:: Why how can there be, Socrates, false pleasures or pains?

Socrates:: You might as well ask, Protarchus, how there can be true or false fears,—or true expectations or opinions, or such as are not true?

Protarchus:: Perhaps I might grant the possibility of this in respect of opinions; but not of the rest.

Socrates:: What say you? We seem indeed to be mooting a subject by no means small.

Protarchus:: You say truly.

Socrates:: But whether it has anything to do with our former discussion, that, son of a distinguished sire, is the question to be considered.

Protarchus:: Well, perhaps that question is so.

Socrates:: Then we must bid farewell to those other interminable topics, and, indeed, to any of the subjects that it not relevant to enter upon.

Protarchus:: Bight.

Socrates:: Then tell me:—for I, at least, am always in a state of wonderment about these very difficulties that we have now brought forward for consideration.

Protarchus:: How do you mean?

Socrates:: Are there not some pleasures false, and others that are true?

Protarchus:: How can that be?

Socrates:: Then, according to you, neither in dreams nor in sober earnest,—in mad fits nor in delusions,—is it possible for any one ever to fancy he is enjoying himself, though he is not, or to fancy he feels pain, though he does not.

Protarchus:: We all, Socrates, suppose all such cases to be possible.

Socrates:: Are we right then in supposing it, or must we consider whether this is correctly said, or not?

Protarchus:: I should say, Socrates, that is a matter for consideration.

Socrates:: Then let us come to a still clearer definition in what we now say about pleasure and opinion. You will grant, I suppose, that there is such a thing as our having an opinion about something.

Protarchus:: Yes.

Socrates:: And also feeling pleasure.

Protarchus:: Yes.

Socrates:: But surely the subject of our opinion is something.

Protarchus:: Of course.

Socrates:: And also that in which the pleased takes pleasure.

Protarchus:: O certainly!

Socrates:: Then that which holds an opinion,—be it rightly or wrongly,—never loses the property of really having an opinion.

Protarchus:: How can it?

Socrates:: Then that also which feels pleasure, rightly or not, can never, it is plain, lose the reality of being pleased.

Protarchus:: Yes; this also is as you say.

Socrates:: Then how in the world does it happen that an opinion can become false or true, while it is the nature of pleasure alone to be true? For both dike have the property of really fancying as well as being pleased.

Protarchus:: That question requires consideration.

Socrates:: Is it that opinion is followed by the discovery of its falsehood or truth, and so becomes not a mere opinion but a certain kind of opinion in either case,—is this the point that you say you must consider?

Protarchus:: That is so.

Socrates:: But there is yet another point beside this that we must come to an agreement upon,—whether it really is the case at all, that some things have certain qualities, while pleasure and pain alone are simply what they are, and do not admit of a particular character.

Protarchus:: Clearly so.

Socrates:: But surely it is not difficult to see this, that they have certain qualities. We said long before, that both do decidedly become great and small,—pains, I mean, as well as pleasures.

Protarchus:: Assuredly so.

Socrates:: And further, if the condition of badness attaches to any of these, we shall say that an opinion thus becomes a bad one, and so likewise a pleasure.

Protarchus:: Why, of course, Socrates.

Socrates:: But what if rightness, or the opposite to rightness, attaches to any of them? Shall we not then talk of ‘right opinion,’ if it has rightness, and of pleasure in the same way?

Protarchus:: It must be so.

Socrates:: And further, if the opinion we have formed is mistaken, we must surely allow that such opinion then,—

erroneous as it is,—is not right, and does not take a right view.

Protarchus:: How can it?

Socrates:: Well, if we perceive, in the other case, that some pain or pleasure is mistaken in the matter about which one is either pained or pleased,—shall we give it the epithet of 'right,' 'good,' or any other term of approbation?

Protarchus:: Of course, that is not possible, since the pleasure will be a mistaken one.

Socrates:: Yet surely it may often happen that a pleasure is felt, not based on sound judgment, but involving some fallacy.

Protarchus:: Undoubtedly; and the judgment, Socrates, in that ease and under such circumstances, we do call false; but no one would ever think of calling the pleasure a false one.

Socrates:: Well, you stand up stoutly for the argument for pleasure, Protarchus, by your present reply.

Protarchus:: Not at all; I only say what I hear.

Socrates:: And is there no difference at all, my friend, between the pleasure based on right judgment and accurate knowledge, and that which often arises in all or any of us with false notions and ignorance?

Protarchus:: Why, it does seem likely that there is a considerable difference.

Socrates:: Let us then proceed to a consideration of this difference between the two.

Protarchus:: Proceed in whatever way you think best.

Socrates:: Should I then take this direction?

Protarchus:: Which?

Socrates:: There is, we say, false opinion and true opinion also.

Protarchus:: It is so.

Socrates:: Well, now, these views,—true or false opinion,—are often attended, as we said just before, by pleasure or pain.

Protarchus:: Certainly.

Socrates:: Is it not then from memory and perception that judgment, and the attempt to discern by a judgment, come to us in every case?

Protarchus:: Assuredly.

Socrates:: Then must we not think that our position in regard to matters of this kind is of the following kind?

Protarchus:: What is that?

Socrates:: Would you not say that it often occurs to one who sees an object from a distance not very clearly, to wish, to get a correct knowledge of what he sees?

Protarchus:: I should say so.

Socrates:: Then, as the next step, such an one would be likely to put this question to himself.

Protarchus:: What question?

Socrates:: 'What in the world is that object that seems to be standing by that rock under a tree?' Is not this what you think a man would say to himself, if he saw some such objects presented to him on any occasion?

Protarchus:: Of course.

Socrates:: Then, after that, our friend, by way of answer to himself, might say, 'Yes! it is a man,' by a correct guess.

Protarchus:: Host certainly.

Socrates:: Or on the other hand, from a perverse notion that what he saw was the work of some shepherds, he might perhaps call it a statue.

Protarchus:: Just so.

Socrates:: Well, and if he has a friend with him, it may happen that he expresses audibly to his neighbor what he before said to himself, and so gives actual utterance to the very same conviction, and thus that becomes a statement that we before called a judgment formed.

Protarchus:: Of course.

Socrates:: And if he chances to be alone, thinking in his own mind on this same subject, he sometimes goes about keeping it for a long time to himself.

Protarchus:: No doubt he does.

Socrates:: What then? Do you take the same view as I do of what results in this case?

Protarchus:: What is that?

Socrates:: It seems to me that our minds under such circumstances resemble a book.

Protarchus:: How so?

Socrates:: The memory coinciding with the impressions, and those feelings which are closely allied to such coincidence, seem to me, one might almost say, to write in our minds at that time certain words. And when this feeling has written what is really true, then a true judgment and true propositions result from it in us; but when this scribe of ours writes falsehoods, the contrary to the truth is the result.

Protarchus:: This is just my view. I quite accept what you have stated in this way.

Socrates:: Then further accept another artist who at that time arises in our minds.

Protarchus:: Who is that?

Socrates:: A painter who comes after the writing-master and makes pictures on the soul of what we had said to ourselves.

Protarchus:: How and when are we to say that this other artist is produced in us?

Socrates:: When a man removes from the ken of the eye, or any other sense, what he then thought or said, and sees in the mirror of his own mind the images of what had been thought or said. Is not this a case that often occurs in us?

Protarchus:: Most certainly it is.

Socrates:: Then the portraits of true judgments and statements are true, and those of false ones are false.

Protarchus:: Quite so.

Socrates:: If then we have rightly asserted this, let us further consider the following point.

Protarchus:: What is that?

Socrates:: Whether such feelings are necessarily limited to events present and past, and do not extend to the future.

Protarchus:: I should rather say they apply to all times without exception.

Socrates:: Well, did we not before say that the pleasures and pains that were felt only in the mind might precede those of the body? If so, it follows that such foretaste of pleasure or pain must in its very nature have reference to future time.

Protarchus:: That is very true.

Socrates:: Are we then to say that the letter-writing and the painting, which a little while ago we assumed to take place in us, relate to past and present time, but not to future:

Protarchus:: To future, most certainly.

Socrates:: Do you assent thus heartily, because all these impressions are, in effect, hopes in respect of the future, and we always, and all our lives through, are full of hopes?

Protarchus:: Yes, I do.

Socrates:: Now then, beside what you have already stated, answer me on this other point.

Protarchus:: What point?

Socrates:: Is not an honest and religious and good man under all circumstances, beloved of the gods?

Protarchus:: Of course he is.

Socrates:: Well, a dishonest and thoroughly bad man is, you will allow, just the reverse?

Protarchus:: Certainly.

Socrates:: That every man, as we said just now, is filled with many hopes.

Protarchus:: To be sure he is.

Socrates:: And there are in all of us certain propositions, which we called hopes.

Protarchus:: Yes.

Socrates:: And also the fantasies of hopes depicted in us. For instance, a man often in fancy sees a great store of gold coming to him, and many pleasures attending it; and as part of the picture he sees himself very much delighted at his own good luck.

Protarchus:: Certainly.

Socrates:: Must we then assert, or rather deny, that in these cases, speaking generally, the writings and paintings presented to the mind of the good are true, through their being favorites of heaven, but the bad not true, quite in the other way?

Protarchus:: We ought without doubt to assert this.

Socrates:: Well, now, the bad have in no less degree pleasures depicted in fancy, only these, I suppose, are false.

Protarchus:: Of course.

Socrates:: Generally, then, the pleasures which the bad delight in are unreal, but those of good men are real.

Protarchus:: It is impossible to state the case otherwise.

Socrates:: Then according to our present views there are such things as unreal pleasures in the souls of men, though bearing a resemblance to true ones as a low parody. And similarly in the case of pains.

Protarchus:: There are so.

Socrates:: Then in this case—according to our former statement—a man who forms notions at all must always have real notions, but sometimes on matters that are not, never were, and never will be realized.

Protarchus:: Certainly.

Socrates:: And it was the non-existence of these, I suppose, that caused his notions to be false at that particular time, and therefore himself to form a false opinion. Is it not so.

Protarchus:: It is.

Socrates:: Well, then, must we not allow equally to our pains and our pleasures, that the condition which these have find a counterpart in the former.

Protarchus:: How?

Socrates:: That it must be allowed that a man rejoices really at any time when he feels joy at all and under any circumstances, even without being able to say why; but that he sometimes does so at things that do not and never did exist, and often, or perhaps most frequently, at things that are not likely ever to happen at all.

Protarchus:: This too, Socrates, must be as you say.

Socrates:: Will not then the very same argument hold about fears and all strong impulses and emotions of that sort,—that all these are also false in certain cases?

Protarchus:: Assuredly.

Socrates:: Well, can we call opinions unbound in any other respect than by their proving false?

Protarchus:: In no other way.

Socrates:: Nor can we understand pleasures, I suppose, being-bad in any other way but in being false.

Protarchus:: Rather, it is just the contrary to what you have said. For one might pretty safely affirm that it is not at all through their falseness that pains and pleasures are bad, but because they involve some other serious badness.

Socrates:: Well, bad pleasures, and such as are so through their badness, we will speak of a little later on, should it still seem to us both advisable. But those which are false, and which exist or arise in us on many subjects and on many occasions, we have yet to discuss in a different way; for perhaps we shall find this useful in making our decisions.

Protarchus:: Of course,—that is, if there are false pleasures.

Socrates:: There certainly are, Protarchus, in my view at least. But, so long as this opinion has a place in our minds, of course it cannot be allowed to remain unquestioned.

Protarchus:: Rightly said.

Socrates:: Let us then stand to our new argument like athletes.

Protarchus:: Proceed we.

Socrates:: Well, now, we said, if our memories are correct, a little while ago, that when what we call desires are on us, then the body separately by itself, and the soul also independently, are doubly affected by these feelings.

Protarchus:: We remember,—this teas said before.

Socrates:: Then that part of us which desired states contrary to those of the body, was the soul; while the part of us that manifested the pain, or some degree of pleasure from actual impression, was the body.

Protarchus:: Yes, it was.

Socrates:: Now then gum up the result of what happens under these circumstances.

Protarchus:: Say what it is.

Socrates:: Why, that m this case both pains and pleasures are present to us at once; and that at the same time there occurs a consciousness of these feelings, each of which is contrary to the other; as, indeed, appeared to us just now.

Protarchus:: It seems so, certainly.

Socrates:: Has not this also been stated by us, and may we not now take it for granted, as we have already agreed about it?

Protarchus:: What is that?

Socrates:: That both these feelings, pain and pleasure, admit of a more and a less, and so belong to the class of infinites.

Protarchus:: That has been stated, of course.

Socrates:: Then what way is there of coming to a right decision about this?

Protarchus:: In what respect, an how do you mean?

Socrates:: If our intention in judging these feelings, in any cases of this sort, aims in each instance at deciding which of the sensations of pain or pleasure is greater, and which less,—which is felt in a greater and which in a stronger degree; that is to say, pain compared with pleasure, or pain with pain, or pleasure with pleasure,—

Protarchus:: Well, this is so, and such is the object of oar judgment.

Socrates:: What then? must we conclude, that though in matters of sight the seeing the sizes of things from a distance [or near] tends to make their reality uncertain, and causes us to form false notions of them; yet in pains and pleasures this same result does not occur?

Protarchus:: I say, Socrates, in the latter case it occurs all the more.

Socrates:: Then our present conclusion proves to be contrary to that we arrived at just before.

Protarchus:: What do you allude to?

Socrates:: We then said that the judgments, accordingly as they were themselves false or true, infected both the pains at the same time Mid the pleasures with their own falsehood or truth.

Protarchus:: Most true.

Socrates:: But now it seems that the pleasures themselves, by being viewed from far and near by frequent alternations, and at the same time by being set side by side with each other, appear, the pleasures as contrasted with the painfulness greater and more intense, and the pains on the other hand, through their being put along side of pleasures, to be that which is contrary to them.

Protarchus:: It cannot be but that this does take place, and for the reasons you give.

Socrates:: Then the amount by which pleasures and pains severally seem greater than the realities, viz. so much as depends on mere appearance, cut off from each; and you will not say that it was a right appearance, nor venture to affirm that such part of the pleasure and the pain as depended on such mere appearance, was itself right or true.

Protarchus:: No, indeed.

Socrates:: Next then to this, and with the hope of getting to the truth in this way, we will view pleasures and pains, that both seem to be and really are still more false than those we have just spoken of, in the case of animals.

Protarchus:: What pleasures do you speak of, and how do you mean?

Socrates:: We have said, if I mistake not, more than once, that when the normal state of any animal is disturbed by congestions or looseness, surfeits or deficiencies, and by certain conditions of increase or decrease, pains, aches and discomforts, and all the feelings that we designate by such names, follow as the result.

Protarchus:: Yes, that has been affirmed several times.

Socrates:: And further, when they get back into their natural state, this restoration, we accepted as our conclusion, was what constituted pleasure.

Protarchus:: Rightly said.

Socrates:: But what are we to call it, when none of these processes take place in our bodies.

Protarchus:: And when can that happen. Socrates?

Socrates:: The question you just now asked, Protarchus, is irrelevant.

Protarchus:: Why so?

Socrates:: Because it does not prevent me from putting my question to you again.

Protarchus:: What do you mean?

Socrates:: If, I shall repeat, such a case of neutrality should occur, what must necessarily be the consequence in us?

Protarchus:: Do you mean, when the body is not moved in the direction of either pleasure or pain?

Socrates:: That is my meaning.

Protarchus:: Why, this of course is plain, that in such a case neither pleasure could ever occur nor any pain.

Socrates:: Admirably answered. But, I imagine, you mean this by your question, that it is a necessity that some of these processes should be going on In us, as the philosophers say; for everything is ever in a state of flux either up or down.

Protarchus:: Yes, they do say that; and I don't think they state an unimportant doctrine.

Socrates:: How could they, unless, indeed, they were of no importance themselves? However, my wish is to get clear away from this subject which is bearing down upon us and I am thinking to avoid it in this way; so do you join me in the attempt.

Protarchus:: Only say how.

Socrates:: 'Granted that this is so,' let us say to the philosophers. And now do you answer me. When anything affects the state of any living creature, is it always aware of every thing that goes on in it,—that is, are we never unconscious that we grow, or have any such change taking place in us,—or is it quite the other way, that such changes are almost unperceived?

Protarchus:: It is quite this other way.

Socrates:: Then we are wrong in what we just now stated, that the changes that take place in us one way or the other produce in us pains and pleasures.

Protarchus:: Of course we were wrong.

Socrates:: Then what we say will be better stated, and less liable to cavil, in this way.

Protarchus:: How?

Socrates:: That great changes do cause in us pains and pleasures, but moderate or trifling ones do not cause either in the least degree.

Protarchus:: This is a more correct way of stating it than that, Socrates.

Socrates:: Then if this is so, we come back to the life we just before spoke of.

Protarchus:: What life was that?

Socrates:: The life that we said was devoid of pain and without joys.

Protarchus:: Most true.

Socrates:: Then from these data let us set down three kinds of life, one that of pleasure, the next that of pain, and one that is neutral. Or how would you state the case on this matter?

Protarchus:: In no other way than this,—that the kinds of life are three.

Socrates:: Then the mere absence of pain can never be identical with the active sense of pleasure.

Protarchus:: How can it be?

Socrates:: Then whenever you are told, that there is nothing in the world so delightful as to pass your whole life without pain, what do you suppose is meant by the person who says this?

Protarchus:: Why, such an one appears to me to assert that the not feeling pain is pleasure.

Socrates:: Theft, that we may use terms of better omen, of any three things whatever belonging to us that you please, take one to be gold, another to be silver, and a third to be neither this nor that.

Protarchus:: I assume this.

Socrates:: Can then the 'neither this nor that' become either this or that,—gold or silver?

Protarchus:: Of course not.

Socrates:: Then neither would the middle life become pleasant or painful, according to the true view of the matter; it could not rightly be thought so, if any one chanced to think it such, nor rightly called so, it he used such a term.

Protarchus:: How indeed could it?

Socrates:: Well but, my friend, there are, we know, some who say and think this.

Protarchus:: There certainly are.

Socrates:: Do they then really think they feel joy at that time, viz. when they are without pain?

Protarchus:: Why, they say they do.

Socrates:: Then they do think they are then pleased, or they would not say so, I presume.

Protarchus:: It may be so.

Protarchus:: But they hold a false opinion about being in a state of joy, if, as we say, the nature of not being pained and of feeling joy is distinct.

Protarchus:: But we did say they were so.

Socrates:: Must we then assume in our reasonings that these states are three, as we just now did, or only two,—pain, an evil to mankind, and riddance from pains, which, as in itself a good, gets the name of pleasure?

Protarchus:: How is it, Socrates, that after our former agreement we are asking ourselves this question? don't understand.

Socrates:: The fact is, Protarchus, you do not understand the enemies that our friend Philebus has.

Protarchus:: And whom do you mean by them?

Socrates:: Men who are said to be very clever in physics, and who deny that pleasures are pleasures at all.

Protarchus:: Then what do they say they are?

Socrates:: They maintain that what Philebus and hits party call pleasures, are all so many escapes from pains.

Protarchus:: Then do you advise us to follow these, or how, Socrates?

Socrates:: Not to follow them, certainly, but to use them as guessers at truth, who make their guesses not by art, but by a well-intentioned yet stem natural dislike of pleasure,—the dislike of those who heartily detest the influence that pleasure has, and believe there is no good in it, and so come to the conclusion that its very seductiveness is a mere juggle and not really pleasure. Well then, you may use these men for such purposes, as guessers, when you have well considered some more of their dislikes; and after that you shall hear what seem to me to be true pleasures, in order that we may fully see from both of our statements the influence that pleasure possesses, and make a comparison of our views for the purpose of judging.

Protarchus:: You say well.

Socrates:: Then let us go in quest of these, by way of allies, by following the course of their dislikes. I suppose then that they argue in some such way as this, beginning with first principles. If, they would ask, we wanted to understand the true nature of any class of things, as of ‘hard,’ should we look at once to the hardest objects for better realizing the idea, or to those which are scarcely hard at all? So now, Protarchus, you are bound to give an answer to these dissatisfied gentry, as you would to me.

Protarchus:: O certainly! I tell them, that should look to examples first in magnitude.

Socrates:: Then if we wished to understand also the class of things to which pleasure belongs, we must not look to small pleasures, but to those that are called the highest and most intense.

Protarchus:: Any one would concede this so far.

Socrates:: Are not then the ready pleasures,—those which, as we are often saying, are also the greatest,—these bodily indulgences of ours?

Protarchus:: Certainly.

Socrates:: Are these then greater, or do they become so, in persons suffering from illnesses, or in healthy subjects? And now mind, lest by a hasty answer we make a blunder.

Protarchus:: How?

Socrates:: Why, we might perhaps say, in healthy subjects.

Protarchus:: Likely enough.

Socrates:: Well, but do not those pleasures exceed in intensity, for which also the strongest longings previously arise in us?

Protarchus:: That is true.

Socrates:: And do not fever-patients, and persons suffering from the like ailments, feel thirst or cold in o greater degree, and all the other ordinary bodily affections; and are they not more familiar with the sense of want, and have they not greater pleasures in being satisfied? Ur must we say that this is not really the case?

Protarchus:: Rather, as you put it now, it seems quite true.

Socrates:: Well then, should we seem to be right in saying, that if one wanted to see examples of the greatest pleasures, we should go to the sick bed rather than to the healthy in order to view them? And mind that you don't suppose I mean by the question, whether those who are seriously ill feel more joys than those in health; but imagine me to be inquiring about the greatness of pleasure, and in what subjects excess in the feeling of delight occurs at any time. For we are bound, according to our view, to comprehend what is the true nature of pleasure, and what it is according to those who deny its existence at all.

Protarchus:: I think I follow your argument pretty well.

Socrates:: Presently, Protarchus, you will show that you understand me not less well; for you will give an answer to my question. Do you perceive greater pleasures,—mind, I don't say more, but exceeding in intensity and capability of increase,—in a life of lewdness, or in one of self-restraint? And consider well before you reply.

Protarchus:: Yes, I understand your meaning; I do perceive a great difference. The virtuous are constantly kept in check by the mere force of the proverb which recommends *ne quid nimis*, to which they give ear; but as for your lewd and immodest sensualists, the excess of pleasure that holds them in thrall makes them notorious.

Socrates:: Rightly answered. And if this is so, it is clear that it is in a vitious condition both of mind and body, and not in virtue, that the greatest pleasures and also the greatest pains are produced.

Protarchus:: Certainly.

Socrates:: Then one is bound to take some of these pleasures by way of example, in order to sec what nature and effect these have that we called greatest.

Protarchus:: That is what we must do.

Socrates:: Consider then the pleasures from diseases of this kind, and see what their effects are.

Protarchus:: To what diseases do you allude?

Socrates:: The pleasures from disorders of a less decent kind, such as the stem opponents we have spoken of thoroughly detest.

Protarchus:: What pleasures?

Socrates:: Why, the ways of curing the itch by friction, and similar sensations which require no very different treatment. For tell me, in heaven's name, what are we to call such feeling when it arises in men? A pleasure, or a pain?

Protarchus:: Why this, Socrates, seems to be a kind of evil of mixed character.

Socrates:: Now don't suppose that it was on Philebus' account that brought forward this subject; the fact is, without these pleasures, and such as follow in their wake,—that is, without these being fully seen into,—we might well-nigh despair of deciding, for ourselves the matter we are inquiring into.

Protarchus:: Then we must proceed to the pleasures akin to those.

Socrates:: Do you moan those which in their mixed nature partake of both pleasure and pain?

Protarchus:: Certainly I do.

Socrates:: Weft now, there are some mixtures that are bodily, and in our bodies only, others that are mental, and only in the mind. But we shall find other mixed pleasures and pains that are common to both mind and body, and which get called, taken together, sometimes pleasures and sometimes pains.

Protarchus:: How is that?

Socrates:: Whenever a person, in the restoration or disturbance of the harmonies, is sensible of two opposite feelings at once,—as when he is cold and warms himself, or is hot and is getting cool, with the wish, I presume, to have the one sensation, but to get rid of the other; then what we call ‘sweet mixed with bitter’ is so present that he cannot easily get rid of the discomfort; and so it causes first a feeling of impatience, and then fierce excitement.

Protarchus:: What you now say is singularly true.

Socrates:: Then mixed feelings of this kind are made up, some of equal pains and pleasures, some of one or the other in excess.

Protarchus:: Undoubtedly.

Socrates:: Then say that the one sort,—when pains are felt greater than the pleasures,—is that which we before said belonged to the itching and the ticklings;—that is, when the boiling and scalding sensation is inside, and one cannot reach it by the rubbing and the scratching, but relieves only the surface; then, by bringing the parts to the fire, and in despair of relief changing the seat of the affection, they produce, sometimes very great pleasure, sometimes, on the contrary, to the inward parts, by contrast with the pain of the outer, mixed pains and pleasures,—to whichever aide they may incline,—by forcibly separating and diffusing what has become clogged, or by bringing together and blending in one what is too diffuse, and by thus bringing pains into direct contrast with pleasures.

Protarchus:: Most true.

Socrates:: Then whenever, on the other hand, the pleasure prevails in the combination in all such eases, while the small admixture of the pain just tickles us and makes us feel slightly uncomfortable, the greater amount of the pleasure that is poured in intensifies our feelings and sometimes makes us unable to sit still, and by causing all sorts of changes of color, of posture, and of breathing, produces in us complete ecstasy, and even utterances aloud when the fit is upon us.

Protarchus:: ’Tis so, indeed.

Socrates:: And it makes a man say too about himself, and about others, that through the delight of these pleasures he almost dies; and, of course, he pursues these at all times, and so much the more, as he is without self-restraint and has a weakness towards vice. Of course, also, he calls these the greatest, and the man who lives most in the indulgence of them he reckons the happiest.

Protarchus:: You have described all that happens, Socrates, according to the opinion of most men.

Socrates:: Yes, as far as the pleasures are concerned which consist in the mixed feelings of the body alone, when these feelings are combined, those within with those without. But with respect to those in the mind, which have joint effects contrary to those of the body, mental pleasure at the same time in contrast with bodily pain, and pain with pleasure, so that both combinations form one mixture,—these we discussed a little while ago, and remarked, that when a man gets empty he longs for repletion, and that in his hope he feels joy, while in getting empty he feels pain. But there is another point that we did not then ask you to notice, and therefore we now say it, that whenever the mind is at variance with the body, in all such cases, which are endless, the union of pain and pleasure is always one and the same.

Protarchus:: What you say appears to be most true.

Socrates:: There still remains one more instance of the mixtures of pain and pleasure.

Protarchus:: Which, do you say?

Socrates:: The combination which we asserted the mind often admitted by and within itself.

Protarchus:: How con that be, and what do we moan by this particular case?

Socrates:: Take anger, fear, desire, outbursts of grief, love, jealousy, envy, and similar emotions,—do you not reckon, all these to be certain painful feelings in the mind alone?

Protarchus:: To be sure I do.

Socrates:: Shall we not then find that they are filled to the brim with exceeding joys? Or do we require to be reminded of what Homer says, “the anger that allows even a prudent man to be vexed, and which is much sweeter than honey poured down the throat;” and of the pleasures that exist, mixed with pains, in violent grief and longing desire?

Protarchus:: We do not require to be told this; it is so, and it is not likely ever to be otherwise.

Socrates:: Of course, too, you remember scenes in the tragedies, when the spectators rejoice and weep at one and the same moment?

Protarchus:: Of course I do.

Socrates:: And can you be ignorant of the disposition of our minds in the acting of the comedies,—that even here there is a mixture of pain and pleasure.

Protarchus:: I don’t quite see that.

Socrates:: Perhaps not. It certainly is not easy, Protarchus, in this case to comprehend in every instance the existence of such a mixed feeling.

Protarchus:: It is not, as it seems to me.

Socrates:: But let us get an idea of it all the more because it is obscure; in order that in other instances one may more easily understand what is meant by a mixture of pain and pleasure.

Protarchus:: Say on.

Socrates:: The term envy we just now used,—will you define it to be a distress of mind, or how?

Protarchus:: As you state it.

Socrates:: But surely the envious man will be found to feel a sudden pleasure when he hears of the misfortunes of others.

Protarchus:: Assuredly.

Socrates:: Well, ignorance, and what we call a stupid state of mind, is a misfortune.

Protarchus:: Of course.

Socrates:: From these considerations then see what the real nature of the sense of the ridiculous is.

Protarchus:: You have only to state it.

Socrates:: There is, then, a kind of ill-nature, speaking generally, which takes its name from a particular habit; and of this general ill-nature ridicule is a part, that has for its subject the contrary to the injunction of the inscription at Delphi.

Protarchus:: You mean 'Know yourself,' Socrates.

Socrates:: I do. But it is clear that, if the very opposite were said by the inscription, it would be 'Not to know oneself at all.'

Protarchus:: Of course.

Socrates:: Now try, Protarchus, to divide this very fault of self-ignorance into three.

Protarchus:: How do you mean? I am afraid I shall not be able.

Socrates:: You mean then that I must make the division for the present?

Protarchus:: I do; and I not only say it, but I ask it.

Socrates:: Must not then each one of the self-ignorant have this affection in one of three respects?

Protarchus:: How is that?

Socrates:: First in respect of property,—they must think they are richer than in proportion to their real means.

Protarchus:: No doubt there are many who have that weakness.

Socrates:: But there are still more, I suppose, who think themselves taller or better looking, and that all the other bodily accomplishments exist in them in a degree much surpassing the reality.

Protarchus:: Assuredly.

Socrates:: But by far the greatest number, I suppose, err in the third respect, that of the mental qualities; they fancy themselves superior in virtue when they are not so.

Protarchus:: Very true indeed.

Socrates:: And of these virtues is it not on the subject of wisdom that, by laying claim to it under all circumstances and conditions, the mass of mankind is most full of rivalries and vain conceit?

Protarchus:: Of course that is so.

Socrates:: Then if one called all and any feeling of this kind bad, one would not be far wrong.

Protarchus:: Quite so.

Socrates:: This feeling then, Protarchus, we must again subdivide into two, if we intend, by considering the childish form of envy, to get sight of a less obvious combination of pleasure and pain.

Protarchus:: How do you mean that we are to cut it in two?

Socrates:: All, who foolishly hold this false opinion about themselves,—these, I say, (which indeed is true of all men generally,) must, in some cases have bodily strength and power, in other cases, I suppose, the contrary.

Protarchus:: That must be so.

Socrates:: Then take this as your rule m dividing. Those who are conceited with weakness of body, and are unable when laughed at to resent it, you will not be wrong in calling ridiculous. But those who are able to avenge themselves you may call formidable and burly bullies, and not men of peace; and you will give thus to yourself the best possible account of such men. For the self-ignorance of the strong is aggressive and discreditable, injurious as it is to others both in its reality, and as represented in action on the stage; but the self-ignorance with weakness takes rather the rank and the nature of the ridiculous.

Protarchus:: You speak quite lightly; but I must confess the mixture of pleasures and pains in these instances has not yet become clear to me.

Socrates:: First then take the property of envy.

Protarchus:: Only say on.

Socrates:: I suppose it is ‘an unjust grief and pleasure.’

Protarchus:: That is certainly so.

Socrates:: In saying unjust, you will grant that it is neither unjust nor invidious to take pleasure in the misfortunes of enemies.

Protarchus:: Of course it is not.

Socrates:: But can we say the same,—that it is ‘not unjust’ not to be grieved, but to feel pleasure when we see occasionally the misfortunes of friendly persons?

Protarchus:: Of course that must be unjust.

Socrates:: Welt, we said that self-ignorance was a misfortune to all, did we not?

Protarchus:: Rightly stated.

Socrates:: Then we are right too in saying that the fancied cleverness and comeliness and the other kinds of conceit’ that we spoke of in friends, occur under three forms; and those attended with bodily weakness are ridiculous, those backed by strength are odious. Or shall we deny the truth of what I lately said, that this habit in friendly persons, when a man has it in a way not to harm others, is ridiculous?

Protarchus:: Certainly it is.

Socrates:: And must we not allow that it is a misfortune, as it is a kind of ignorance?

Protarchus:: Very much so.

Socrates:: And do we feel delight, or rather sorrow when we laugh at it?

Protarchus:: It is clear that we feel delight.

Socrates:: But pleasure at the misfortunes of friends,—do we not say it is envy that is the cause of this?

Protarchus:: Necessarily so.

Socrates:: Then our argument tells us, that when we laugh at what is ridiculous in friends, in introducing the element of pleasure into envy, we do in effect blend together this pleasure with pain; since it reminds us that it was some time ago agreed, that envy was a mental pain, and that laughing was a pleasure; and thus that these two feelings were produced in U together at those particular times.

Protarchus:: That is true.

Socrates:: Then our argument now tends to show us, that in outbursts of grief and in tragedies,—and not in stage-acting only, but in the general tragedy and comedy of life,—pains are mixed up with pleasures, and in countless other instances besides.

Protarchus:: It is impossible not to admit that, Socrates, even if' one is ever so earnest in maintaining the opposite views.

Socrates:: Well, now, we instanced anger, regret, passionate grief, fear, love, jealousy and envy, and other feelings of that sort, and said that we should find blended in them those two emotions we have so often had occasion to repeat.

Protarchus:: Yes.

Socrates:: Do we understand then that all we have hitherto argued about are grief, envy, and anger?

Protarchus:: Of course we are aware of it.

Socrates:: Are there not many topics yet remaining?

Protarchus:: Indeed there are.

Socrates:: What now do you suppose was my principal object in pointing out to you the mixed feelings in comedy? Was it not for the sake of proving that it would be easy to show the mixture incidental to fears, loves, and the other emotions; and therefore that, when you had fully realized the nature of this one, you were bound to let me off and not' to protract the conversation by proceeding to the other questions, but (as said) to comprehend just this, that both body independently of soul, and soul of body, and the two together in their joint affections, are full of pleasure blended with, pains. Now therefore say, whether you intend to let me off, or to go on till midnight. However, by a brief promise I expect I shall get you to let me go: I shall be quite willing tomorrow to give you an account of all these other emotions; but at present I am desirous to pass on to the remaining points of the argument for the decision which Philebus orders me to make.

Protarchus:: You have said well, Socrates, but pray take your own way in going through the rest.

Socrates:: Pursuing then the natural course, next after the mixed pleasures by a kind of necessity we should proceed in turn to those which are unmixed.

Protarchus:: You have said very well.

Socrates:: It shall be my endeavor then by this change in our subject to make you see what they are. As for those who contend that there is no pleasure except in cessation from pains, I don’t at all agree with them, though, as I said, I use their evidence to prove that there are some pleasures which seem to be such, but are not so id reality, and some others, neither few nor small, that we fancy to be such, but which are inseparably connected with pains and with intervals of rest from pains of the severest kind in bodily and mental distresses.

Protarchus:: And what pleasures on the other hand, Socrates, ¦would one rightly conceive to be true?

Socrates:: Those connected with what we call beautiful colors, with forms and outlines, with very many of the odors, with sounds, and all those things which, involving no consciousness nor discomfort in the want of them, afford us satisfactions at once perceptible and agreeable, and free from any mixture of pain.

Protarchus:: What do we mean, Socrates, by this new account of objects of pleasure?

Socrates:: Certainly, what I mean is not at once clear, but I will try to make it so. "What I am now trying to describe as beauty of form is not what most people would imagine by it, such as that of animals or pictures,—but I mean (says our argument) the straight and the circular; and of these, such as are formed by the instrument for making rounds, both as circles and globes, and such rectangles as are made by rules and squares;—you understand my meaning? Tor these, I affirm, are not relatively beautiful, like other things, but are beautiful at all times by themselves and in their very nature, and possess pleasures peculiarly their own, not at all resembling those of the scratchings we spoke of. So, too, the colors I refer to are those which are beautiful because they are of the same general character, and the same in the pleasures they produce. Do we understand what our argument points to, or not?

Protarchus:: I endeavor to do so, Socrates; but try on your part to state your meaning still more plainly.

Socrates:: Well, then, I am speaking of such sounds as are smooth and distinct, which give expression to one clear melodious note; and I say these are not merely relatively but absolutely beautiful; and further, that they are attended by congenial pleasures in hearing them.

Protarchus:: Well, no doubt this is so also.

Socrates:: As for the kind of pleasures connected with scents, it has less of the divine in it than those of sound; still, the fact of their having in them no necessary admixture of pains, in whatever way and in whatever part of us these arise,—I regard as entirely on the side of correspondence with those I have mentioned above. "Well now, these, if you see my meaning, are two kinds of what we are wont to call pleasures.

Protarchus:: I understand you.

Socrates:: Now then let us add to these the pleasures attendant; on learning, if, as I suppose, these appear to us not to involve any previous hunger after knowledge, nor, consequently, any discomforts originating from such a feeling as want of information.

Protarchus:: Yes, I agree with that view.

Socrates:: Well, now, if men have been filled with knowledge and some losses of it occur afterwards through forgetfulness, are you aware of any feelings of distress in them?

Protarchus:: No, not naturally so, but perhaps there may be in certain reflections about such a mishap,—when a man has lost something and is pained from the want of it.

Socrates:: But at present, my good Sir, our discussion is only about the actual feelings of nature, apart from any reflection.

Protarchus:: Then you say with truth that sometimes forgetfulness does occur to us in learning without any feeling of pain.

Socrates:: Then we must say that these pleasures of learning are unmixed with pains, and by no means the lot of the many, but of the very few.

Protarchus:: Of course we must admit that.

Socrates:: Then, as we have now distinguished with sufficient care the pure pleasures and those which might fairly take some such name as 'impure,' let us add to our statement, that the excessive pleasures are immoderate, but those which are not excessive have the contrary quality of moderation. So also with respect to greatness and intensity, and to pleasures which become such either often or only seldom, let us attach to them the condition of belonging to the class of the infinite which more or less pervades both body and mind; but those which are not so, let us place in the category of the proportional.

Protarchus:: What you say is quite correct, Socrates.

Socrates:: Then beside these points there are yet these others in them which we have next to get a clear view of.

Protarchus:: What do you mean?

Socrates:: The question, which we should say has relation to truth, the pure and the unmixed, or the violent, the excessive, the great, and the satisfying?

Protarchus:: With what object do you ask that, Socrates?

Socrates:: Because, Protarchus, I wish to omit no characteristic of pleasure and knowledge in testing their real worth, if it should appear that one part in each of them is pure, and the other not pure; in order that each may come pure and unmixed to the trial, and so make it easier for me and you and all the company here present.

Protarchus:: Rightly said.

Socrates:: Come then, let us take this view about all the kinds of things that we call pure,—let us take one of them first as an example and examine it thoroughly.

Protarchus:: What then must we take?

Socrates:: Among the first, if you please, we will consider the kind to which white belongs.

Protarchus:: By all means.

Socrates:: In what way then can pure whiteness, and under what condition, be best presented to us? Shall we say the purity of it consists in the greatest degree and quantity, or in its being least mixed,—that is, when no other particle of any color is in it?

Protarchus:: Clearly, in the white which is most genuine and pure.

Socrates:: Rightly answered. So then we are to account this the truest, Protarchus, and at the same time the most beautiful of all the whites, and not that which is most in quantity, or the largest in surface?

Protarchus:: Most correctly said.

Socrates:: Then we shall make no mistake at all in affirming, that a little pure white is whiter, as well as prettier and more genuine, than much white of a mixed sort.

Protarchus:: So; your statement will be quite right.

Socrates:: What then? Surely we shall not require many examples of this kind for our argument about pleasure, but it is enough for us to understand from the instance now before us that, in the most inclusive sense, all pleasure, if unmixed with pain, would be sweeter, truer, and better in its kind, even a small than a great one, or little than much.

Protarchus:: Assuredly it would; and we want no other example to prove it.

Socrates:: What then are we to say of another theory of pleasure? Have we not been told respecting it that it is in all cases a process of production, and that there is no real existence in pleasure at all? For there are subtle reasoners who undertake to show the truth of this other view, and we are bound to thank them for it.

Protarchus:: How is that?

Socrates:: I will discuss with you this very question more at length, by asking a few further questions, friend Protarchus.

Protarchus:: You have only to state the case and put your questions.

Socrates:: There are, then, two correlative principles, one existing independently, the other which ever has something else for its aim.

Protarchus:: What are the principles you mean, and in what sense do you speak of them?

Socrates:: One which in its very nature ever ranks first in dignity, and the other which falls far short of that.

Protarchus:: Say what you mean still more clearly.

Socrates:: We have noticed, I suppose, handsome and ‘well-born boys accompanied by manly admirers.

Protarchus:: Certainly have.

Socrates:: Now, as these are two, so try and find two other principles resembling them in all things of which we predicate Relativity.

Protarchus:: Say clearer, Socrates, what you mean.

Socrates:: Nothing very subtle, Protarchus; it is only the subject that is teasing us. What it asserts is, that there is always one kind of thing that exists for the sake of another, and something else, for the sake of which whatever at any time takes place with a view to some result must be considered to take place.

Protarchus:: At last I understand your meaning, but only through its having been several times repeated.

Socrates:: And perhaps soon, my dear boy, we shall understand still better, as the argument proceeds.

Protarchus:: That is sure to be the case.

Socrates:: Let us then get hold of these other principles.

Protarchus:: "What are they?

Socrates:: One, the process of becoming in all things, the other, the state of being.

Protarchus:: I take on your word then the two facts of Existence and Production.

Socrates:: Most rightly said. And which of these, must we say, is for the sake of which,—production for existence, or existence, for production?

Protarchus:: Do you mean by your present question to ask, whether what we call existence is what it is (i.e. existence) for the sake of production?

Socrates:: That seems the drift of my question.

Protarchus:: In Heaven's name, is this what you ask me; 'Tell me, Protarchus, whether you say shipbuilding is for the sake of ships, or rather are ships for shipbuilding? And so of all matters of that sort.'

Socrates:: That, Protarchus, is precisely what I do mean.

Protarchus:: Then why don't you answer your own question, Socrates?

Socrates:: There is no reason why I should not. Do you however take part in the reply.

Protarchus:: Oh, of course.

Socrates:: Very well, then; I say that it is for the purpose of producing some result that drugs and implements of every kind, and all material, are placed at every one's disposal; and further, that every act of production takes place for the sake of bringing into existence some special thing, some for one and some for another; in a word, that production in general is for the sake of being in general.

Protarchus:: Nothing can be clearer than that.

Socrates:: Then surely pleasure, if it is a production at all, must needs be so for the sake of something produced.

Protarchus:: Of course.

Socrates:: But certainly that for which whatever is at any time done, for the sake of another, is done, that stands in the condition of the good; while that done for the sake of something must, my excellent friend, be put in another category.

Protarchus:: That must be so, indeed.

Socrates:: Then, if Pleasure is a production, we must, to class it correctly, place it in some other position than that of the good.

Protarchus:: Such will be the most correct placing.

Socrates:: Then, as I said at the beginning of this discussion, we are bound to feel grateful to any one who shall have explained to us the nature of pleasure, and proved that there is no real existence in it at all, since it is only a coming into being. For it is clear that such a one throws ridicule on those who say Pleasure is a Good.

Protarchus:: Decidedly.

Socrates:: But surely this same person will ridicule sometimes those who make the end consist in such productions.

Protarchus:: How? Whom do you mean?

Socrates:: Those who take pleasure in trying to cure hunger or thirst or any affection of that sort, such as can be cured by producing another state,—and who are pleased at the producing it, as if that were pleasure itself. So, they say they would not care to live at all if they could not feel hunger and thirst, and had no experience of all those other passions that usually go with such sensations, but which we need not specify.

Protarchus:: They certainly seem to say this.

Socrates:: Should not all of us admit, now, that the opposite to becoming is the gradually ceasing to be?

Protarchus:: That must be so.

Socrates:: Then one who chooses this kind of life virtually chooses a state of destruction and production, and not that third kind of life, in which there is neither joy nor grief, but the purest use of the intellect?

Protarchus:: Much inconsistency, as it seems, Socrates, is the result, if one regards Pleasure as our good.

Socrates:: Much indeed; and let as state this in another way, thus.

Protarchus:: What way?

Socrates:: Surely it is unreasonable that there should be no good at all and no beauty either in bodies or in many other things, but only in the soul; and that even there no other good should exist but pleasure, and that manliness, self-control, intellect, or any of the fine qualities which the soul claims as its own, should be neither good nor beautiful! It is unreasonable too to be forced to say, that one who does not feel joy, but grief, is bad at the particular time when he is in grief, though, in fact, he may be the very best of men. Or again, that one in a state of joy, in proportion as he rejoices, is superior in respect of virtue at the particular time when he rejoices.

Protarchus:: All these suppositions, Socrates, are as unreasonable as they can possibly be.

Socrates:: Well, now, don’t let us endeavor at all costs to make a full and thorough investigation of pleasure, but at the same time show ourselves to be, as it were, very niggardly of mind and science. Rather let us, like men in earnest, ring our theory all round, to find if it has any weak point in it, till we discover the purest forms that pleasure and mind present, and so are able to use the most genuine portions of mind and science, as well as those of pleasure, for the decision to be made between them.

Protarchus:: You say rightly.

Socrates:: Then, if I mistake not, one department of mathematical science is employed in the service of the arts, another in that of education and culture,—or how say you.?

Protarchus:: As you do.

Socrates:: Let us then consider first, in the case of the manual arts, whether one part of them be not more directly allied to science, and another part less so; and whether we ought not to regard the former sort as the purest possible, the other as less pure.

Protarchus:: Yes, we ought.

Socrates:: In each of these then we should take separately the leading arts.

Protarchus:: "What arts, and in what way do you mean?

Socrates:: Thus: that if one separates from all the arts counting, )measuring, and weighing, the residue in each, so to say, would be quite insignificant.

Protarchus:: It would indeed.

Socrates:: For surely there would remain only conjecture for the rest, and to exorcise our senses by a kind of knack or tact, by calling in the aid of the faculties of guessing, which, indeed, many persons call arts, whereas their strength has really been produced by practice and exercise.

Protarchus:: That certainly is the case.

Socrates:: Then, to take music first: I presume it is full of such haphazard, since it often makes a tune not by measured time, but by guess-work resulting from practice. All flute-playing especially is full of it, as it tries to catch the precise time of each string in the lute, as the sound proceeds from it, by conjecture, so as to involve much that is uncertain, and but little that is fixed and settled.

Protarchus:: Most true.

Socrates:: Well, and we shall find medicine and farming and steering and the command of armies to follow precisely the same principle.

Protarchus:: Assuredly.

Socrates:: But the art of building, I presume, makes use of measures and tools more than any Other; and as these impart to it a great degree of exactness, they cause it to be more really an art than most of the sciences are.

Protarchus:: In what way?

Socrates:: Why, it is so in ship building and house-building and many other departments of carpentry. It employs, if I mistake not, a straight rule, and an instrument for drawing circles, a level and a line, and an ingenious contrivance for applying the plummet.

Protarchus:: Indeed, Socrates, you speak quite correctly.

Protarchus:: Then let us class under two heads the so-called arts; those which go with music, and have less exactness in the performance; and those of building, which have more.

Protarchus:: Let that be assumed.

Socrates:: And of these let us allow that those are the most exact which we lately called leading arts.

Protarchus:: I suppose you mean arithmetic, and such other arts as you lately spoke of in connection with it.

Socrates:: Assuredly. But must we not, Protarchus, describe these also in their turn us two-fold? How say you?

Protarchus:: Of what sorts are you speaking?

Socrates:: In the first place, must we not speak of arithmetic as of one sort, as employed by the many, but another, as applied to philosophy?

Protarchus:: By what distinction can one set down one kind of arithmetic under one head, another under a different one?

Socrates:: The distinction, Protarchus, is by no means a small one; some mathematicians count up unequal units in such things as pertain to number, e.g. two camps, two cows, two very small or two very large things; the other will never go a step along with them, unless one allows that no unit differs from any other single unit out of all the countless number of them that exist.

Protarchus:: You say very properly that there is no small difference in those who are engaged on numbers; so that it seems reasonable that the sciences are two.

Socrates:: Well, now, calculation and measurement, in building or in buying and selling, as respectively differing from the geometry of the scientific and the carefully computed reckonings,—must we say that each of these is one, or must we consider them as two?

Protarchus:: For my own part, following the same course as before, I should affirm that each of these was two, as far as I have a vote in the matter.

Socrates:: Eight: and now do you understand why we have brought forward these illustrations?

Protarchus:: Perhaps I do; yet withal I should like you to give your own views on the question just proposed.

Socrates:: Well, then, it seems to me that the present argument has advanced thus far in looking for some counterpart to pleasures, which was its aim when we commenced it, and to be now inquiring whether there is a kind of science, as there is also a kind of pleasure, that is more pure than another. Protarchus: This, indeed, is very plain, that the argument has taken up these inquiries with this object in view.

Socrates:: Tory good. And did not the same argument try to make out, by tie agreement we came to above, that there are different branches of art in the various departments of knowledge, some more, others less plain and definite?

Protarchus:: Assuredly.

Socrates:: And does it not now, in the last example? we took, after specifying an art that bears the same name as another, and so bringing us to regard it as one, again put the question to us as if there were two, and ask whether there is not a more definite clearness and purity in such matters in the art as employed by scientific men, than by the unscientific?

Protarchus:: It does indeed appear to put this question.

Socrates:: What reply then, Protarchus, are we to give to it?

Protarchus:: Why, Socrates, we have arrived at a surprisingly great difference between the sciences in respect of clearness.

Socrates:: Shall we not then give the answer more easily?

Protarchus:: Of course; and let that answer be, that not only do these arts surpass greatly the others, but even in these such as are employed in the studies of your genuine philosopher are immensely superior in exactness and truth respecting measures and numbers.

Socrates:: Let this then be taken as your view; and in faith in you let us confidently reply to those who are so clever at dragging words,—

Protarchus:: Well, what?

Socrates:: That there really are two arithmetics and two mensurations, and many other branches of learning of the like kind, which have this doubleness, though they share in a common name.

Protarchus:: By all means let us give this answer to the clever people you mention, and may luck attend it.

Socrates:: Those sciences then we affirm to be in an especial manner exact.

Protarchus:: Assuredly.

Socrates:: But, Protarchus, the faculty of dialectic would disown us, if we preferred any other to her.

Protarchus:: And what are we call this other science?

Socrates:: Evidently, one that should have cognizance of all that we now call ‘exact science.’ For I imagine, on my own part, that all the world,—that is, all who have the smallest sense belonging to them,—fully believe that knowledge to be far the truest, which deals with abstract existence, and the real, and the naturally unchangeable. What do you think? What decision would you, Protarchus, arrive at?

Protarchus:: I did hear, more than once, Gorgias saying, my dear Socrates, that the art of persuading far surpassed all arts, in that it brought everything into subjection to itself not by putting constraint on the hearers, but by their own consent; and that thus it was by far the best of all the arts. But now I should not care to oppose either you or that distinguished rhetorician.

Socrates:: By force of arms, you wanted to say; but I fancy you dropped them through shame at making such an attack.

Protarchus:: At present, you shall have it all your own way.

Socrates:: I wonder if am to blame for your not rightly understanding me.

Protarchus:: In what respect?

Socrates:: I had not yet got, friend Protarchus, to asking this, what art or what science surpasses all in being the greatest and best and most beneficial to us; but which has for its aim certainty, exactness, and strict truth, even though it be small in itself and confer but small benefits,—that is the purport of my present inquiry. But now consider this point well, without fear of offending Gorgias, if you concede to his art the condition of being the best in respect of its serviceableness to men; while in respect to the profession of dialectic I have just mentioned,—as I said then about white, viz. that if there was but little of it, but still pure, it surpassed much white that was not pure, in this very quality of being the most genuine,—so now let us take this subject seriously in mind, and sufficiently consider the arguments both for and against it, without looking at any special benefits conferred by the sciences, nor to the repute in which any of them are held; but, if there is any natural faculty in our minds for loving truth and for doing everything for it, let us say, after a thorough search into it, if we can assert that this faculty above all others does, in all probability, possess this purity of mind and intellect, or if we must look for some other that has higher claims than this has in this respect.

Protarchus:: Well, I have given it due consideration, and I think it is difficult to allow that any other science or art has a greater hold on the truth than this has.

Socrates:: I presume you have made the present statement with the knowledge of this fact, that most of the arts, and those who are engaged in them; in the first place make use of mere opinions, and inquire intently into matters of opinion; and if a man thinks he is inquiring into the nature of things, you are aware that the study of his life is about this world of ours, how it was created, how it is affected by or how it affects others, may we say this, or how must we state the case?

Protarchus:: As you have put it.

Socrates:: Then the labor which such a person takes up with is not about things ever existent, but about things that are being produced, or that have been or will be produced.

Protarchus:: That is very true.

Socrates:: Can we then affirm that there is any certainty, in the strictest truth of the word, in things, none of which ever were, or will be, or at this present are, in the same unchangeable state?

Protarchus:: Of course not.

Socrates:: Then in matters that possess no fixedness nor permanency at all. how can any reasoning ever become fixed or settled to us?

Protarchus:: In no way at all, I should say.

Socrates:: Then they are not the objects of thought or science that deals in perfect truth.

Protarchus:: It is not likely, I think.

Socrates:: Then you and I, who take this view, are bound to give both Gorgias and Philebus a hearty farewell, and to call attention to this point in our argument.

Protarchus:: "What point do you mean?

Socrates:: That we have either in those abstract subjects of contemplation the fixed, the pure, the true, and what we call the genuine,—I mean, in those which always exhibit precisely the same conditions, without the least admixture with any other thing; or, as the next best resource, whatever is nearest akin to them; while all other things must be called secondary and be said to come after them.

Protarchus:: What you say is very true.

Socrates:: Ought we not then, of the terms that are applied to such subjects, to assign the fairest to those which are them selves the fairest?

Protarchus:: It seems reasonable.

Socrates:: Are not then ‘Mind’ and ‘Intellect’ such terms as one would specially hold in honour?

Protarchus:: Yes.

Socrates:: Then such terms, in abstract conceptions, may, if rightly given, be called fitly applied.

Protarchus:: By all means.

Socrates:: Well, but the claimants which were before brought forward by me for the decision, were none other than what we express in these very terms.

Protarchus:: Of course they were, Socrates.

Socrates:: Very good; then if some one were to talk to us as artisans, and tell us that Intellect and Pleasure were set before us as materials from which and on which we were to manufacture something by blending the two together, he would not use an inappropriate figure of speech.

Protarchus:: That is very true.

Socrates:: Ought we not then, as the next step, to try to combine them?

Protarchus:: Of course.

Socrates:: Would not then our success be better secured by first mentioning, by way of reminding ourselves, these further points?

Protarchus:: What are they?

Socrates:: They are what we had in mind some time ago; but the proverb seems a good one which says that ‘A. sound view should be turned over twice and even thrice in discussion.’

Protarchus:: Certainly.

Socrates:: Come then, I conjure you in heaven’s name; for believe what we did say then was expressed in, some such terms as these.

Protarchus:: How?

Socrates:: Thus: ‘Philebus says pleasure is rightly the object of all creatures, and all ought to aim at it; that this, in fact, and no other, is the good to all without exception; and that these two terms, ‘good’ and ‘pleasant,’ are rightly given to what is in truth one, and forms one natural class. But Socrates, in the first place, says this is not so, and affirms that as in their names, so in their nature, the two qualities ‘good’ and ‘pleasant’ are different from each other; and that Intellect has a better claim to the conditions of the Good than Pleasure has.’ Is not this, and nothing but this, what we then said, Protarchus

Protarchus:: Yes, it certainly is.

Socrates:: Should we not then still agree between ourselves on the following point?

Protarchus:: What point is that?

Socrates:: That ‘the Good’ has in its nature this superiority over all other things.

Protarchus:: In what respect?

Socrates:: That if any creature possesses this always, fully, in every way and under all circumstances, it never requires, anything in addition, but has in the most perfect manner all that satisfies its wants. Is it not so?

Protarchus:: It is so, certainly.

Socrates:: And did we not essay in our argument to take each of these apart from the other, and assign to the life of one set of beings Pleasure unmixed with Intellect, and similarly to another Intellect without the least particle of Pleasure in it?

Protarchus:: That was so.

Socrates:: We did not then conclude that either the one or the other of them was sufficient in itself for any one, did we?

Protarchus:: Indeed we did not.

Socrates:: And if we then went at all astray from the truth, let some one else now take up the matter again, and tell us what is the more correct view, classing under one general head memory, intellect, knowledge, and right judgment, and considering whether any one, without these, would care to have or to come into possession of anything whatever,—to say nothing of pleasure, be it as much or as intense as possible,—since in that case he could have no correct notion that he felt joy, no knowledge at all of what the feeling is that is upon him, and no recollection whatever of that feeling for any moment of time. And the same you 'may say of Intellect; the question being whether, with the absence of all pleasure, even the briefest and smallest, a man would care to possess intellect, rather than have it in conjunction with some pleasures, or all pleasures without intellect, rather than with some intellect.

Protarchus:: That cannot be, Socrates: there really is no use in asking such questions many times over again.

Socrates:: Then perfect and thorough good, and such as all would choose, can be found in neither of these alternatives.

Protarchus:: How can it be?

Socrates:: Then we must get a notion what is 'the good,' either distinctly or in some general way, in order, as we said, to have some claimant to give the second prize to.

Protarchus:: What you say is very right.

Socrates:: Then we have now come upon a way that will lead us to 'the good.'

Protarchus:: What way?

Socrates:: Much as if a person, wanting to find out where somebody lived, were in the first instance to be correctly informed of the place of his residence. I suppose he would have one great aid towards finding what he was looking for.

Protarchus:: Of course he would.

Socrates:: Just so a course of reasoning has informed us, as indeed we were warned at first, not to look for the Good in the unmixed, but in the mixed life.

Protarchus:: Certainly.

Socrates:: But surely there is more hope that what we are seeking will become plain to us in the life that is well and properly mixed than in that which is not.

Protarchus:: Very much more, Indeed.

Socrates:: Then let us proceed to make this mixture with a prayer to the gods,—Diorysus or Hephaestus, or whichever of the celestials holds this special prerogative of blending things together.

Protarchus:: By all means.

Socrates:: And now we may fancy ourselves wine-servers, and that we have sources at hand to draw from That of Pleasure one may fairly compare to honey; that of intellect, a sober and wineless fount, to a wholesome water with no sweetness in it; and these we must endeavor to mix together in the best possible way.

Protarchus:: Certainly we must.

Socrates:: Tell me then, before we begin, are we likely to hit the right result by combining pleasure generally with intellect generally?

Protarchus:: Perhaps so.

Socrates:: But that would not be safe; I think I can put forward a notion of mine whereby we can mix with less risk.

Protarchus:: Tell me what that is.

Socrates:: One kind of pleasure, we said, is more truly pleasure than another; just as one art is more exact than another art.

Protarchus:: Undoubtedly it is.

Socrates:: And one kind of knowledge is superior to another kind, the one looking only to things that are born and perish, the other, to those which do not, but which are entities ever the same. This knowledge then we, having regard to the truth of each, considered more true than that other.

Protarchus:: And you rightly so considered it.

Socrates:: Then if we first see the result of the mixing together these truest portions of each, pleasure and knowledge, [we may ask,] will these, when so blended, be sufficient to produce and furnish, us with this most desirable kind of life; or do we further require some of those ingredients that are not quite so pure and genuine?

Protarchus:: It appears to me, we had better do as you say.

Socrates:: Let us then suppose that we have a man who has an intelligent perception of the true nature of abstract justice; with reasoning powers on a par with his natural intuitions, and with similar views on all other abstract subjects whatever.

Protarchus:: Well, let that be assumed.

Socrates:: Shall we then say that such a person has science enough if he can give an account only of circles and globes as mentally conceived, but has no knowledge at all of the sphere and the circles that are used by men on this earth,—and if he uses in house-building, in the same abstract and unpractical way, not only the circles but all other rules and measures?

Protarchus:: The disposing of our time and trouble, as we now speak of it, on the abstract sciences alone, Socrates, would be absurd.

Socrates:: Do you mean then to say, that we should throw in, and mix up together with the abstract, this variable and not really pure art of the fallacious measure and circle of the practical builder?

Protarchus:: Why, that must be done, if any one of us expects even to find his way home on any occasion.

Socrates:: And must we also mix up music,—mean the practice of it which we said, a little while ago, was full of guesswork and mere imitation, and deficient in pureness?

Protarchus:: To me it appears necessary, if our life is to be really life in any conceivable way.

Socrates:: Would you then have me follow the example of a door-keeper who is hustled and overpowered by a crowd, and so, as being beaten, open wide the doors, and then let go the whole lot of sciences, to pour in and mix together, the less perfect with the pure?

Protarchus:: For my own part, Socrates, I don’t know what harm one can get from taking in all the other sciences, if one has already those which stand first.

Socrates:: Then must I let them all loose together, to flow into the bed of Homer’s very poetical meeting of the waters?

Protarchus:: By all means.

Socrates:: Then there they go! And now we have to return to the source from whence we drew pleasures: for, though we had intended to mix them and the sciences in a certain way, by taking first portions of those only which were true, we failed in doing this. Our fondness for Science generally caused us to let loose at once all the kinds of science, and that before the pleasures.

Protarchus:: "What you say is very true.

Socrates:: Then now is the time for you and me to take into consideration the question about pleasures also; whether we are to let go the whole of these also in a body, or should send off first only those of them which are true.

Protarchus:: Certainly it is far better, as a measure of safety, to let go the true pleasures first.

Socrates:: Then let them go on their way. But what next? Must we not, as in the case of the Sciences, if some pleasures are necessary for our condition, mix in these also?

Protarchus:: Undoubtedly; such as are necessary at all events.

Socrates:: But surly if, as we said it was not only harmless but even useful to possess a practical knowledge of all the arts through life, so we now assert the same about the pleasures,—that is, if we assume that it is beneficial to us, as well as Harmless to all men generally, to be in the enjoyment of all pleasures all our lives,—then we are bound not to omit any of them in making the mixture.

Protarchus:: How then are we to speak of these same pleasures, and how are we to act with respect to them?

Socrates:: You should not put the question to us, Protarchus, but to the pleasures themselves and the intellectual faculties, by an inquiry of this sort about their mutual relation.

Protarchus:: What is the nature of the inquiry?

Socrates:: 'My friends, whether I am to call you Pleasures, or to address you by some other name, would you not be quite willing and content to live in company with all intellectual exercise, or would you rather live without it?' For my part, I think they could not possibly avoid giving this reply to the question.

Protarchus:: What reply?

Socrates:: 'That, as was before said, it is neither possible nor beneficial for one solitary class, unmixed with any other, to exist by itself apart from the rest. We think, however, that of all the various kinds, weighing one against another, that is the best for residing with us, which consists in the comprehensive knowledge not only of things generally, but also of each of us Pleasures in as perfect a manner as is possible.'

Protarchus:: 'And a very proper answer you have now given us,' we shall say to them.

Socrates:: Rightly so. And now in turn we must put a similar question to Mind and Intellect. 'Do you feel any want of pleasures in combining yourselves?' we should say to them. 'Pleasures indeed!' they would perhaps say in contempt.

Protarchus:: I dare say they would.

Socrates:: And our address to them after this would run thus: 'In addition to those pleasures which are genuine,' we should say, 'do you further require that those which are the greatest and the most intense should reside with you?' 'Of course not, Socrates,' they would say, 'when they do but cause us endless interruptions, by disturbing the thoughts in which we are wrapt by insane delights, and do not only prevent us, the intellectual faculties, from being called into play at all, but totally ruin and spoil, in nearly every Instance, the offspring that may be born of us, by causing forgetfulness of them consequent on neglect? No! those other pleasures that you have mentioned,—those which are pure and genuine,—regard, if you like, as almost a natural part of us; and beside them, such as are associated with bodily health and a well-ordered mind, and, indeed, all which put themselves in the train of Virtue generally, as of a goddess, and accompany her everywhere,—these, too, you may combine with us. But, of course, it would be utterly unreasonable to mix up with Mind any pleasures, be they what they may, that go with lewdness and vice of any kind, if one desires to see such effects of a mixture and a combination as are as beautiful and as harmonious as possible, and to try to learn in and by them what is the real nature of Good both in man and in the universe, and what eternal principle we must conceive it to be.' Shall we not say that Mind gives by this reply a sensible answer and one worthy of itself, in its own behalf and that of Memory and Bight Judgment?

Protarchus:: Host certainly.

Socrates:: Well, but surely this too is a necessity, and nothing but this can ever occur as a result?

Protarchus:: What may that be?

Socrates:: If we do not mix up truth, no true result can be produced, nor, if produced, exist.

Protarchus:: How can it?

Socrates:: It is impossible. But, if anything more is wanted for a mixture of this kind, do you and Philebus say so. For myself, I regard the conclusion we have now arrived at as a kind of invisible order made for the good government of a body endued with a living soul.

Protarchus:: Add, then, Socrates, that such is my opinion also.

Socrates:: Perhaps then we should not be very far wrong in saying that we now take our stand at the front door of 'the Good,'—the fore-court of the abode where such true Good resides.

Protarchus:: Such, at least, is my opinion.

Socrates:: What principle then is there in this mixture, that would seem at once the most valuable, and the chief cause of such a disposition being acceptable to all? For, if we succeed in getting a view of this, we will next proceed to consider whether it is more congenial and more allied to Pleasure or to Mind, In its place in our system of ‘a general order.’

Protarchus:: We shall be right in doing so; for such a rule will be most useful for us in making our decision.

Socrates:: Well, now, it is not difficult, in mixture generally, to perceive the cause that makes this or that kind of it worth either all or absolutely nothing.

Protarchus:: How do you mean?

Socrates:: No one, I suppose, is ignorant of that.

Protarchus:: Of what?

Socrates:: That all mixture, be it what it may and however made, that has not measure and a natural proportion, necessarily brings with it the spoiling not only of the ingredients used, but of itself in the first place. It would be no mixture, a process like that,—it becomes in reality a mere jumble that has nothing like mixture it,—a bringing together that actually brings loss on the owners whenever it is made.

Protarchus:: Most true.

Socrates:: Now, therefore, we find this property of ‘the good’ has taken refuge in the nature of ‘the beautiful.’ For measure and proportion, of course, are coincident all the world over with beauty and excellence.

Protarchus:: Indeed they are.

Socrates:: But we further said that truth was associated with them in the combination.

Protarchus:: Certainly.

Socrates:: Then, if we cannot get hold of The Good under one general principle, let us take it with three, Beauty, Symmetry, and Truth, and say, that we shall most properly regard them as One, and the real cause of the ingredients in the mixture remaining good, and through that, as being a good, that the mixture itself is also good.

Protarchus:: Yes, that is quite correct.

Socrates:: By this time then, Protarchus, any man will have become a competent judge of pleasure and intellect, and able to say which of the two is more akin to the Supreme Good, and held in higher esteem among gods as well as men.

Protarchus:: It is clear, no doubt; but still it will be better to argue the question fully out.

Socrates:: Let us then judge each of the three severally in comparison with Pleasure and Mind; for we are bound to see to which of the two we should assign each as being nearer of kin to it.

Protarchus:: You mean by the three Beauty, Truth, and Pleasure, I presume?

Socrates:: Yes; and take Truth first, my Protarchus. And when you have got it before you, fix your mind's eye upon the trio, Mind, Truth, and Pleasure; then take some time to think, and answer yourself, Is Pleasure or Mind more akin to truth?

Protarchus:: Why should we take time? In respect of truth, I suppose, there is a great difference between Mind and Pleasure. That is the most vainly pretentious of things; and there is even a saying, that in the pleasures of love, (which, you know, are considered the greatest,) even perjury holds a general pardon from the gods, on the ground that these pleasures are like children, and possess not an atom of sense. "Whereas Mind is either the Fame as Truth, or more like it than anything else, and the truest.

Socrates:: Next, then, make the same comparison with regard to moderateness, and consider if Pleasure has in itself more of it than Intellect, or Intellect than Pleasure.

Protarchus:: This subject that you have proposed for consideration is not more difficult than the last. I suppose one could find nothing in the world that is in its nature more devoid of moderation than pleasure and ecstatic enjoyment, and nothing that has more of it than mind and science.

Socrates:: You have answered well. But still say about the third quality, Beauty,—has Mind a larger share of it, or the class of things to which Pleasure belongs, so that Mind is more beautiful than Pleasure, or the converse?

Protarchus:: Why certainly, Socrates, no man ever yet either conceived in his dreams or saw when awake that science and mind ever were, in any way at all, or are, or ever will be, things of moral ugliness.

Socrates:: You say rightly.

Protarchus:: But surely, when we see any one, be he who he may, enjoying pleasures, and those of about the most ecstatic sort; observing that either ridicule or the greatest disgrace follows the indulgence of them, we are ashamed of them ourselves, and try to hide and put thorn out of sight as much as possible, reserving all such acts for night, as if it were not proper that they should see the light.

Socrates:: You will proclaim then all the world over, Protarchus, sending word by messengers and telling it to all present, that Pleasure is a possession that stands neither first in value nor even second; that the first is surely that connected with measure and the moderate, with right time and place, and with all those qualities and conditions which we must suppose that, as being of the like kind, the Eternal Nature has chosen for its own.

Protarchus:: It seems so, certainly, from the course of our present argument.

Socrates:: The second, then, is that which has symmetry, beauty, perfection, sufficiency, and all the qualities which belong to this other class.

Protarchus:: It seems likely.

Socrates:: If then you set down as the third,—as far as I can divine—Mind and Intellect, you would not stray very far from the path of truth.

Protarchus:: Perhaps not.

Socrates:: Must we not then allow that there are yet others that stand fourth.—those which we put down as purely mental, the sciences, arts, and right opinions, as they are called? Are not, I repeat, these fourthly to be added to the former three, if, as we assert, they are more akin to The Good than to Pleasure?

Protarchus:: Perhaps so.

Socrates:: Then, fifthly, we must put those pleasures which we distinguished as painless, calling them pure pleasures of the soul itself, some attending on sciences, some on perceptions.

Protarchus:: It may be so.

Socrates:: 'But at the sixth class' (as Orpheus says) 'bring to a close the order in the song.' And in fact, our argument, too, seems to be closed with the determining of the sixth place. After this then nothing remains for us but to add what we may call the finishing touch to all that we have hitherto said.

Protarchus:: Then let that be done.

Socrates:: Come then, as a third cup to the saving god, let us once again bring before the notice of the company and discuss the same proposition as before.

Protarchus:: What proposition do you mean?

Socrates:: Philebus reckoned Pleasure, in its completeness and entirety, to be to us 'The Good.'

Protarchus:: By using just now the phrase 'third cup,' you meant, as it seems, that we must take up once again from the beginning the original subject.

Socrates:: Yes; and to what follows after this let us give our attention. I, having a clear view of the truths I have now expounded, and feeling' a dislike of Philebus' account of the nature of Good,—and not only his, but that of others, many thousands in number,—affirmed that Mind was a far better and more profitable thing than at least Pleasure was to the life of men.

Protarchus:: That was so.

Socrates:: Suspecting too that there were many other things better than Pleasure, I said that, if something should prove to be better than both these, I would take the side of Mind in the contest with Pleasure for the second prize; and that Pleasure would be deprived even of second-class honors.

Protarchus:: Yes, that you did say.

Socrates:: Well, after this it was shown by most sufficient proofs that neither of these two was sufficient for us.

Protarchus:: Most true.

Socrates:: In this discourse then both Mind and Pleasure were quite put out of the question, as not being either of them in itself the good, since they were found wanting in the self-sufficing quality, and in the property that should characterize the satisfying and the complete.

Protarchus:: You have stated it quite correctly.

Socrates:: And now that another and a third claimant has come forward, better than either of these; again Mind has proved to be infinitely more nearly related and more suited to it than Pleasure, in all the conditions that characterize a superior.

Protarchus:: Assuredly so.

Socrates:: Then, according to the verdict which our argument has at last delivered, the real value of Pleasure will prove fifth in order.

Protarchus:: It seems so.

Socrates:: And not first; no, not even if all the cows and horses and all the rest of the brute creation put together should affirm it by the fact of their pursuing enjoyment. Yet people in general rely on the evidence of these creatures as seers do on. that of birds; and thus they conclude that our pleasures are decidedly the best for us as the object of life. They think, in fact, that the loves of brutes are witnesses of weight, more so even than a love of those reasonings which ever make their Guesses at Truth by the guidance of the goddess of Philosophy.

Protarchus:: That the Truth and nothing but the Truth has been spoken by you, Socrates, we are all of us now prepared to admit.

Socrates:: Then do you allow me to leave you now?

Protarchus:: There is a little matter that yet remains, Socrates; and I assume that you will not be weary of the discussion sooner than we. (If you will stay), I will remind you of the points which are left.

# Philebus.

Translated by Edward Poste.

Socrates, Protarchus, Philebus.

Socrates:: Just observe now, Protarchus, what the proposition is which you are going to take up from Philebus, and what the other is that I maintain, and that you are to controvert if you disallow its truth. Should you like me to state them both concisely?

Protarchus:: By all means.

Socrates:: Philebus asserts the goodness for all sentient beings of Enjoyment, and Pleasure, and Gratification, and all that is denoted by that sort of term. I maintain, in opposition, that Wisdom, and Reason, and Memory, and their kindred, Right Opinion and True Reasonings, are, compared with Pleasure, the better and more desirable acquisition for all that have them in their power; and, indeed, the very greatest acquisition to all such in these or any future times. Our respective positions are something like these, are they not?

Philebus:: Precisely these.

Socrates:: Do you, Protarchus, adopt this tenet that is now handed over to you to advocate?

Protarchus:: I needs must, for Philebus,' our handsome friend, is quite exhausted.

Socrates:: Whatever it may cost, we must somehow arrive at the true decision of this question, I suppose?

Protarchus:: Certainly.

Socrates:: Let us agree on another point.

Protarchus:: What?

Socrates:: We are both to indicate a state and a disposition of soul able to make the life of all men happy, are we not?

Protarchus:: We are.

Socrates:: And you assert this of a state of Enjoyment, I of Wisdom?

Protarchus:: True.

Socrates:: How if some third state prove better than either? In that case, if it turn out more nearly allied to Pleasure, we are both vanquished by the life that really has such beatific power, and the life of Pleasure vanquishes the life of Wisdom?

Protarchus:: Of course.

Socrates:: Should it, however, turn out more akin to Wisdom, Wisdom wins, and Pleasure loses the day. Do you accede to these preliminaries, or not?

Protarchus:: I accede.

Socrates:: And, Philebus, how say you?

Philebus:: Whatever the conditions of the contest, Pleasure is victorious, I think, and always shall. You, Protarchus, must judge for yourself.

Protarchus:: You have resigned the argument to me, Philebus, so you are no longer competent to agree with Socrates, or to disagree.

Philebus:: True; but I wash my hands of his doctrine, and call the goddess herself to witness.

Protarchus:: Yes; and all of us, too, will bear you witness that you asserted what you say you do. But let us try to make the next step, Socrates, with or without the consent of Philebus.

Socrates:: Yes; and our point of departure must be the goddess herself, who our friend here says is called Aphrodite, though her truest name is Pleasure.

Protarchus:: Good.

Socrates:: But my awe in naming the gods is more than human, and greater than the greatest fear. Be Aphrodite, therefore, spoken of as she vouchsafes. Pleasure, I am sure, is multiform; and, as I said, we must make her our point of departure, and consider and inquire into her nature. For uniform as the oneness of her name at first might lead us to suppose her, she assuredly has multitudinous and somewhat dissimilar shapes. For consider, we ascribe Pleasure to uncontrolled self-indulgence, and Pleasure to the act of self-control; Pleasure to folly, full of irrational opinions and hopes, and Pleasure to the exercise of wisdom; and can any one think these Pleasures similar without being justly held to want the faculty of discrimination?

Protarchus:: They spring from opposite sources, Socrates, but are not opposite themselves. For how can Pleasure be other than the likest thing in the world to Pleasure,—that is, to itself?

Socrates:: Why no one color differs from another color, thou acute reasoner, so far as both are colors; but black, we all know, is not only different, but most contrary to white. And to the same extent no figure will differ from another figure, for all are the same in genus: but surely of the species of this genus some are quite contrary to one another, and others have ten thousand points of difference. And so we shall find it stands with many other things. So you must not rely on this argument, by which the most opposite things may be proved to be one and identical, and I fear we shall find an opposition between Pleasures.

Protarchus:: Possibly; but if we do, how will this damage my position?

Socrates:: Because the predicate you propose to apply to them, in spite of their dissimilarities, is a term, I answer, distinct from their genus. You assert that all Pleasures are Good. Now that all the pleasant is pleasant no one denies. But I maintain that some pleasant things, and indeed the greater number, are bad, and yet you call all of them Good, though you acknowledge their dissimilarity when you are pressed. What is there identical in good and bad pleasures which you designate when you call all of them Good?

Protarchus:: What, Socrates, do you think any one will concede when he has asserted that Pleasure is the Good—do you think he will then tolerate your assumption that some are good and others bad?

Socrates:: Why you own they are dissimilar, and some of them opposite.

Protarchus:: Not in so far as they are Pleasures.

Socrates:: We are relapsing into our old argument, Protarchus. We deny any difference between Pleasure and Pleasure, and maintain that all are alike; and the examples just cited miss their aim, and we are going to lay ourselves open to objections, and content ourselves with retorting them, like the sorriest and youngest reasoners.

Protarchus:: How so?

Socrates:: Why, if I copy you and retaliate, I may maintain that the most unlike things are of all the likest, and defend it by the arguments you use; and we shall convict ourselves of puerility, and our discussion will be driven from its course on to the rocks and wrecked. Let us stop rowing then and back water, and perhaps if we do as wrestlers do and start again from our former grip, we may come to some indisputable result.

Protarchus:: In what way?

Socrates:: Suppose, Protarchus, you retorted the same questions on me.

Protarchus:: What questions?

Socrates:: Are not Wisdom, and Science, and Reason, and the things that I originally maintained in my thesis to be Good, when I was asked the nature of the Good, all open to the same criticism as that which you propose?

Protarchus:: How?

Socrates:: They are a numerous class, and present great dissimilarities. But if they even presented contrarieties, should I deserve to be reasoned with if alarm at this fact made me deny there was any difference between Sciences, and thus our discussion should go to pieces, and dissolve, like an idle tale, while we ourselves only escaped from the wreck by breaking the laws of logic?

Philebus:: Heaven forbid—barring the escape. However, I like the evenhanded dealing with both our propositions. Agreed that there are many unlike Pleasures, and many unlike Sciences.

Socrates:: The heterogeneous character of both of our rival Goods must not be disguised, but boldly displayed, in the hope that some test may reveal whether Pleasure or Wisdom, or something different from either, is to be called the Good. For I assume we are not merely emulous for the triumph of the doctrine that I uphold, or the doctrine that you uphold, but the truest doctrine commands the allegiance of both.

Protarchus:: It does.

Socrates:: Let us still further ratify this principle by more explicit agreement.

Protarchus:: What principle?

Socrates:: That which causes such universal trouble, to some men with their will, and to some occasionally against their will. I mean the principle paradoxical enough that just now started up in the discussion. For though the proposition that the Many are One and the One is Many may have a paradoxical sound, it is easily maintained by the advocate of either clause.

Protarchus:: Do you mean when a man says that I the one and individual Protarchus am many, and even proves the many Me's to be opposites of one another, the same individual being great and small, heavy and light, and ten thousand other opposites?

Socrates:: These, Protarchus, are the trite paradoxes about the One and Many, banished by almost unanimous consent from discussion as puerile and obvious and great impediments to true speculation; as also is the artifice of dividing a thing into its parts and members, and on the admission that they are all that original One triumphing over your opponent for holding the monstrous tenet that what is One is Many and infinite, and what are Many are only One.

Protarchus:: And what are the other aspects of this proposition, Socrates, that are not yet trite and banished from discussion?

Socrates:: When, boy, the One assumed is not a thing born and perishing as in the former instances: for then, as I said, and about this kind of One men are agreed not to argue; but if you assume one universal Man or Ox, or Beautiful or Good, such unities earnestly examined and split into pluralities soon kindle genuine controversy.

Protarchus:: On what questions?

Socrates:: First, whether we ought to believe in the veritable existence of such monads; secondly, how each can be one and unchangeable without generation or decay and indubitably single, and yet in the infinite individuals of the phenomenal world is either broken up and divided, or whole in each and sundered from itself; which latter hypothesis would seem the most impossible, for how can one identical thing be simultaneously in one thing and in a multitude of others? These problems, Protarchus, about this kind of unity and multiplicity, not the kind that you mentioned, cast nothing but darkness when wrongly decided, and, when rightly solved, abundance of light.

Protarchus:: Must we work at this question now, Socrates?

Socrates:: So I for one should say.

Protarchus:: And all the rest of us concur; perhaps we had better not wake with queries a sleeping Philebus.

Socrates:: So be it. How shall we begin the long and various battle on the disputed points? Shall it be thus?—

Protarchus:: How?

Socrates:: I say that the transformations by logic of unity into plurality and plurality into unity meet us at every comer in every matter to which language is applied, and are neither a transitory nor a modem apparition, but apparently an undying and unaging phenomenon of reason itself. And from age to age the youth who first detects it is delighted as if he had lit on a treasure of wisdom, and with eager enthusiasm leaves not a syllogism unturned, but now coils and ravels up multiplicity into unity, now unrolls and disperses unity into plurality, to the utter confusion first and foremost of himself, next of any chance neighbor younger, older, or his equal in years, without mercy to father, mother, or any other listener, and hardly to the brutes, let alone mankind, for of course no barbarian would receive any quarter if an interpreter were to be had.

Protarchus:: Socrates, do you see how many we are and all of us young? Have you no fear of our falling on you, Philebus at our head, if you make us the mark of your gibes? However, as there is a grain of truth in what you say, if there is any contrivance or spell to lay this spirit of wild confusion or charm it from the discussion, or any better path to the solution of our problem, pray, do your best to find it out, and we will do our best to follow in your steps. For it is an important question, Socrates.

Socrates:: It is indeed, boys, to use the title sanctioned by Philebus. However, there is not nor can there be a more excellent way than one with which I have long been fascinated, but which has often eluded my quest and left me baffled and forlorn.

Protarchus:: What way do you mean? Describe it.

Socrates:: One easy to point out but very hard to follow. For every kind of art that has ever been invented was disclosed by it. However, listen to my description.

Protarchus:: Proceed.

Socrates:: A gift of gods to men, such at least is my conviction, was flung from some quarter of heaven by some Prometheus along with a most luminous fire; and the men of old, who were better than we and dwelt nearer heaven, transmitted this oracle, that unity and multiplicity constitute what we call Being, and limit and infinity are inwoven in its nature; that, as this is the law of the cosmos, unity should be assumed in every province and proposed for discovery, and the search will not be vain; and after discovering unity we next should look to find within it a duad or triad, or some other number; and in each unit of these latter a further number; until the original One has been not only seen to have unity, multiplicity, and infinity, but has had its multiplicity counted; and that infinity should be kept away from the multiplicity until we have counted the multiplicity that intervenes between infinity and unity; then each unit of the multiplicity may be let go into infinity, and we may rest from our labors. The gods, as I said, sent down a tradition that this is the right method of inquiring and learning and teaching; but the wise of our day are too quick or too slow, as may happen, in making out the Manifold One, and introduce infinity immediately after unity, without ascertaining the intermediates, which is the distinction between dialectical and sophistical reasoning.

Protarchus:: I think I partly understand what you mean, Socrates, but I should like you to explain it more clearly.

Socrates:: The letters of the alphabet which you learnt as a child are an illustration of what I mean. Let us view it as exemplified in them.

Protarchus:: How do they exemplify it?

Socrates:: The sound emitted from the mouth of a man, or of the human race, is one, and yet infinite.

Protarchus:: Certainly.

Socrates:: And the knowledge neither of the unity nor of the infinity of sound makes us scientific; but we must know the number and the nature of the kinds of sound in order to be grammarians.

Protarchus:: We must.

Socrates:: And so to be musicians.

Protarchus:: How?

Socrates:: Sound, the subject of music as well as of grammar, is here, also, one and many.

Protarchus:: Certainly.

Socrates:: Shall we divide it into base, treble, and unison, or how?

Protarchus:: As you have done.

Socrates:: You would not be a musician if this were all you knew about it; though, if you did not know this, you would be an utter stranger to the science of sound.

Protarchus:: Certainly.

Socrates:: But supposing, my friend, you came to know the number and nature of the intervals between sounds distinguished as acute and grave, and of the notes separated by the intervals, and the number of systems they produce, which the men of old who discovered them taught us, their successors, to denominate harmonies; and supposing you saw in bodily motions similar elements and systems, which as being measured arithmetically they would have us denominate measures and rhythms, and understand that this is the right method of investigating all unity and multiplicity;—supposing, I say, you know these details, you are master of the theory; and similar inquiries and discoveries are requisite for the attainment of any other science. But the infinite multiplicity of each set of individuals and their properties leaves you unscientific, and of no account or class on the rolls of learning, as no number or class in any sphere of inquiry have owed you their discovery.

Protarchus:: What Socrates is now saying seems to me admirable, Philebus.

Philebus:: And so it does to me, taken by itself; but what is its relevance or drift?

Socrates:: Philebus is right in asking this question, Protarchus.

Protarchus:: He is, indeed. Will you give him an answer?

Socrates:: I will, after a little further explanation of the principle. As the man who starts from unity ought not to pass at once to infinity, but through definite number, so when he unavoidably starts from infinity he ought not to pass at once to unity, but first look for a number, and distinguish the several multitudes that compose the infinity, and so finally proceed to unity. We may exemplify this by the alphabet.

Protarchus:: How?

Socrates:: On a survey of the infinite variety in voices, some god or godlike man, according to the Egyptian story, in which he bears the name of Theuth, first perceived vowels in this infinity, not one but a multiplicity; and afterwards other elements, neither vocal nor quite devoid of noise, numerous like the former; and lastly the class that we denominate mutes. He then divided first the voiceless and noiseless class, and then the vocal and semi-vocal classes, into their ultimate units. After thus ascertaining their number, he called each and every separate elementary sound a letter; and observing that we cannot take cognizance of any one of them apart from all, in consideration of this common bond and the sort of unity it gives them, he assigned them all to a single theory, and named it the Grammatical art.

Philebus:: This is still clearer than the other statement, Protarchus; but I look in vain for the same point as before.

Socrates:: You mean its relevancy, Philebus?

Philebus:: Yes; this is what I and Protarchus have been long trying to discover.

Socrates:: And yet you were all the time close to what you say you have long been trying to find.

Philebus:: How?

Socrates:: Was not our original debate about Pleasure and Wisdom, and which is to be preferred to the other?

Philebus:: It was.

Socrates:: This is the point which my principle bids us explain: how they each are One and Many and not immediately multiplied to Infinity, and into what Number they are developed before they pass to Infinity.

Protarchus:: This is not an easy question, Philebus, which Socrates has led us into by some circuitous route, I cannot say how. And tell me which of us shall answer the question. Perhaps, indeed, it is absurd, after unreservedly undertaking to be your successor in the controversy, that now, because I am at a loss, I should require you to answer the question; and it would be much more absurd, I think, if neither of us could do so. So consider what we had better do. Socrates asks us about the species of Pleasure, I think; their existence, number, and character: and similarly of Wisdom.

Socrates:: Most true, son of Callias. For unless, as we said just now, we can indicate this in every case of unity, similarity, and identity, and their opposites, we shall be of no account in any inquiry.

Protarchus:: This seems to be nearly the truth, Socrates. However a moderate-minded man holds universal knowledge in high estimation, but next on the list of good, in default of the first, the consciousness of his own ignorance. What is the drift of my remark? I will tell you. You were so obliging as to grant us a conference, and promise your assistance in deciding what is the best of human possessions. Philebus said it was Pleasure and the gratification of desire and Delight and all that sort of thing; and you affirmed in opposition it was not this, but that other group which we keep repeatedly naming, purposely and rightly, that it may be present to our memory, and ready for examination. And you assert, it seems, that what would rightly be called a better Good than Pleasure is to be found in Intellect, Science, Perception, Art, and the tribe akin to these, and these, therefore, not those, should be our aim. As these rival doctrines produced a controversy, we threatened in sport not to let you go home till the question had received some adequate determination and solution. You agreed, and placed yourself at our command. So now we plead the nursery proverb, ‘Fairly given not retaken.’ Cease, then, this way of dealing with the matter.

Socrates:: What way?

Protarchus:: Puzzling us, and putting questions to which we cannot directly give a satisfactory answer. For our general perplexity must not be taken as a termination of the debate; but, if we cannot solve the difficulty, you must solve it yourself. Decide, therefore, for yourself, whether it is necessary to divide Pleasures and Sciences into their species, or whether this may be let alone, if you are able and willing to decide the question in any other way.

Socrates:: Your words release an intimidated man from his apprehensions. The clause, ‘If you are willing,’ quite puts me at my ease. Besides, some god, I think, has refreshed my memory.

Protarchus:: Of what, and how?

Socrates:: I now recollect that I once long ago, waking or dreaming, heard some reasonings about Pleasure and Wisdom, proving that neither is the supreme Good, but something else excelling both.

Now, if we should be convinced of this, Pleasure, in the first place, is vanquished, for she cannot be identified with the Good; and secondly, we shall not want the division of Pleasure into species. But the progress of the inquiry will show whether this is so.

Protarchus:: I am glad to hear what you say. Pray, take this way of settling the question.

Socrates:: Let us first agree on a few other points.

Protarchus:: What?

Socrates:: Must the Good be Perfect ox not Perfect?

Protarchus:: Most Perfect, of course, Socrates.

Socrates:: Well, is it Sufficient?

Protarchus:: It must be so, and must surpass everything else in this respect.

Socrates:: And, I suppose, we plainly must allow that all percipient beings Desire, and pursue, and strive to seize and possess it, and do not care for anything except as means and instruments of Good?

Protarchus:: Plainly.

Socrates:: Now, let us examine and test the lives of Pleasure and Wisdom, taking them separately.

Protarchus:: How do you mean?

Socrates:: Suppose the life of Pleasure has no particle of Wisdom in it, and the life of Wisdom no particle of Pleasure, for if either of these is the Good, it must not need the supplementary addition of anything else; and if either prove to stand in need of anything else, it can no longer be imagined the real Good.

Protarchus:: Certainly not.

Socrates:: Well, let us try and assay them on the touchstone of your volition.

Protarchus:: Agreed.

Socrates:: Well, answer then.

Protarchus:: Put your question.

Socrates:: Would you, Protarchus, consent to pass all your life in the fruition of the greatest Pleasures?

Protarchus:: Of course.

Socrates:: Should you still consider that you needed something else, if your life was perfectly pleasurable?

Protarchus:: No.

Socrates:: Reflect. Would not Wisdom, or Insight, or the power of planning, or anything of the sort, still be necessary?

Protarchus:: Why should they? I should have every thing I wanted in having Joy.

Socrates:: In living thus you would constantly enjoy the greatest Pleasures. But wanting Reason, and Memory, and Knowledge, and True Opinion, you in the first place would not even know whether you were pleased or not, having, as you would have, no grain of Wisdom.

Protarchus:: Certainly.

Socrates:: And similarly wanting Memory you would remember no past Pleasure, and no present Pleasure would leave a trace: and wanting True Opinion when pleased you would have no apprehension of Pleasure: and wanting reasoning power you could not anticipate a future Pleasure: and your life would not be the life of a man but of a zoophyte, or one of ocean's animated shells. Is this true, or can we conceive it otherwise?

Protarchus:: It is true.

Socrates:: Well, then, is such a life Desirable?

Protarchus:: I am altogether embarrassed by what you have said, Socrates.

Socrates:: Let us not flinch from our task, but next examine the life of Reason.

Protarchus:: What sort of life?

Socrates:: Would any one of us consent to live in the full possession of Reason, and Science, and Memory, a perfect stranger to Pleasure and Pain, and absolutely insensible to this class of emotions?

Protarchus:: Neither of these lives seems Desirable to me, or to anybody else, I believe.

Socrates:: But what think you of the Double life, the mixture and union of both?

Protarchus:: You mean the life combining Pleasure, and Reason, and Wisdom?

Socrates:: Yes, that is the kind of life I mean.

Protarchus:: Every one, of course, would prefer this to either of those, and all without exception would desire it in addition to either.

Socrates:: Do you perceive the result of our inquiry?

Protarchus:: Certainly. Three lives have been proposed, and two of these are not Sufficient or Desirable for man or any other living creature.

Socrates:: Is it not already clear, then, about these, at least, that neither of them contains the Good? For if it did it would be Sufficient, and Perfect, and Desirable to all vegetables and animals that had it in their power. And if any of us chose anything else, he would choose unnaturally what is not a true object of choice: his act would be involuntary, and proceed from ignorance, or some unblest necessity.

Protarchus:: So it seems.

Socrates:: So, I think, it has been sufficiently shown that the goddess of Philebus, at all events, cannot be thought identical with the Good.

Philebus:: Nor your Reason, either, Socrates, and for the same defects of title.

Socrates:: Not my Reason, perhaps, Philebus: but the true and divine Reason, I fancy, is of a different character. However, I no longer claim the highest rank for Reason against the Mixed life, but we must examine and decide what to do with the second prize. For, perhaps, the cause of the goodness of this Composite life may be ascribed by one of us to Reason, and by the other to Pleasure, and thus though the Good is identical with neither, the causation of the Good may be due to one or other of the two. This point I would contest with Philebus, and still more this, that whatever it is in the Balanced life which makes it desirable and good has more affinity and similarity to Reason ‘than to Pleasure. And if so, Pleasure cannot be said to have a claim to the second prize any more than to the first. And if I may trust my Reason, her rank is even lower than the third.

Protarchus:: Well, Socrates, Pleasure appears to have already fallen before you struck to the earth by the shafts of your logic; for she entered the lists for the first prize, and is overthrown. And it would seem we must say that Reason was wise in not aspiring to the first prize, for he would have met a similar fate. But now, if Pleasure failed to win even the second prize, she really would be disgraced in the eyes of her lovers, for even they could no longer think her so fair.

Socrates:: Well, well! would it not be better to let her alone now, and not pain her by putting her to the last ordeal, and exposing the emptiness of her pretensions?

Protarchus:: Idle words, Socrates.

Socrates:: Why? Because I talked of an impossibility—paining Pleasure?

Protarchus:: Not only because of this, but also because you are not aware that we shall not release you till you have reasoned out the question to a conclusion.

Socrates:: Heavens! then, Protarchus, what an amount of reasoning remains, and perhaps more than we can exhaust. For we clearly need another plan if we lay claim to the second rank for Reason, and must fight with different weapons to those we have used. Some, however, of the old ones perhaps may be serviceable. Must it be done, then?

Protarchus:: Most certainly.

Socrates:: Let us try to be very careful in laying the foundation.

Protarchus:: What foundation?

Socrates:: Let us divide all things that now exist in the universe into two classes, or rather, if you please, into three.

Protarchus:: Pray explain the principle of division.

Socrates:: Let us employ again some of the statements we recently made.

Protarchus:: Which statements?

Socrates:: The divinity, I think we said, revealed that existence was composed of two elements, an Unlimited and Limit.

Protarchus:: We said so.

Socrates:: Let these be two of the classes, and the third class one produced by the Mixture of these. But it seems I fail ridiculously in attempting an exhaustive division and enumeration.

Protarchus:: What do you mean, my good friend?

Socrates:: That I now want a fourth class.

Protarchus:: Of what nature?

Socrates:: Look at the Cause of the composition of the first two, and add it as a fourth to the former three.

Protarchus:: Will you want a fifth class as an agent of decomposition?

Socrates:: Possibly; but not, I think, now. However, if we should, you will pardon me for asking for a fifth.

Protarchus:: Certainly.

Socrates:: From these four we will separate the three first, and after we have observed how two of these are rent and broken into pieces, and have reunited the fragments, we will try to discover in what manner they were both of them one and many.

Protarchus:: If you explained yourself more fully, perhaps I might understand you.

Socrates:: By the two first to be examined I mean the two that I mentioned just now—the Unlimited and the Limited or Mixed: And I will first try to show the multiplicity of the Unlimited, and meanwhile the Limited may wait.

Protarchus:: It may wait.

Socrates:: Consider; for what I want you to notice is hard to see and open to dispute. Observe, however. Have Hotter and Colder, if you will first look at them, any Limit that you can find; or do not More and Less indwell in their essence, and as long as they dwell there, is not End excluded? For with the admission of End their own existence is ended.

Protarchus:: True.

Socrates:: But the More and the Less are ever inherent in Hotter and Colder.

Protarchus:: Certainly.

Socrates:: This consideration shows that Hotter and Colder are endless, and therefore absolutely Unlimited.

Protarchus:: Very much so, Socrates.

Socrates:: Well answered, Protarchus; and you remind me that the Very Much and the Very Little resemble the More and the Less. Wherever they are found, they tolerate no Definite Quantity; gradations in the force of action are introduced, the Greater and the Smaller follow in their train, and Definite Quantity is exterminated. For, as I said, if they did not exterminate Definite Quantity, but allowed it and Due Measure to invade the seat of More and Less, and Very Much and Very Little, these last would themselves perish from their abiding place. For Hotter and Colder could not survive the admission of Definite Quantity. For they are fugitive and never stay, but Definite Quantity stops, and has its progress arrested. This proves the Unlimited character of Hotter and his antagonist.

Protarchus:: So it seems, Socrates. But as you said, the matter is not easy to grasp. Perhaps, however, explanation and re-explanation may bring questioner and answerer to agree.

Socrates:: True, and so we must try to do. Now, however, not to linger on every detail, see whether this may be taken for a mark of the Unlimited.

Protarchus:: What?

Socrates:: Whatever things change through the degrees of More and Less, and admit Very Much, and Very Little, and Excess, and that sort of character, must be put in the genus of the Unlimited as their unity, in accordance with the rule we laid down, that we must join, to the best of our power, all that is scattered and broken, and stamp it with a single impress. Do you remember?

Protarchus:: I do.

Socrates:: Good; and whatever things do not admit of these characters, but their opposites, first Equal and Equality, next Double and the other proportions of number to number, or magnitude to magnitude, shall we do right if we reckon all these in the genus of Limit, or how say you?

Protarchus:: We shall do right.

Socrates:: Well, and what character shall we assign to the third class that is Compounded of these two?

Protarchus:: You, I think, can tell me.

Socrates:: No. Some god may, if he is propitious to my prayers.

Protarchus:: Pray, then, for divine assistance, and reflect.

Socrates:: I do; and I think some god is propitious to us.

Protarchus:: How? and why do you think so?

Socrates:: I will tell you. And mark me well.

Protarchus:: Proceed.

Socrates:: We spoke just now of Hotter and Colder, did we not?

Protarchus:: We did.

Socrates:: Add to them Dryer and Moister, More and Fewer, Quicker and Slower, Greater and Smaller, and all that we recently united and joined together in the class admitting More or Less.

Protarchus:: You mean the Unlimited class?

Socrates:: Yes; and next mix with them the tribe of Limit.

Protarchus:: What tribe?

Socrates:: The Limitative tribe, that we ought to have assembled a little while ago, as we did the Unlimited, but forgot. Perhaps, however, it will be just the same if we do it now. When these two are blended, the third that results from them will be plain.

Protarchus:: What is the second tribe, and how can we blend them?

Socrates:: The Equal and the Double, and whatever terminates the war of contraries and produces symmetry and concord by introducing Number.

Protarchus:: I understand you. I think you say that by their conjunction all Productions are formed?

Socrates:: You conjecture truly.

Protarchus:: Continue then.

Socrates:: In disease does not their due composition restore health?

Protarchus:: It does.

Socrates:: Are not the acute and grave, quick and slow, originally Unlimited, and does not the advent of this other tribe, by introducing Limit, create out of them the whole world of music?

Protarchus:: It does, perfectly.

Socrates:: And when they enter into cold and heat they expel the excessive and Unlimited, and produce the measured and proportionate.

Protarchus:: They do.

Socrates:: And are not the seasons, and all that is beautiful, the result of this union of Unlimited and Limitant?

Protarchus:: They are.

Socrates:: And there are ten thousand other instances which I omit, as health, and beauty, and strength, and many most beautiful things in the soul. For this goddess, excellent Philebus, seeing that license and vice are devoid of Limit in pleasures and indulgences, established the limitations and restraints of law and order, cramping and crippling the soul, as thou sayest, effecting, as I say, its salvation. But how say you, Protarchus?

Protarchus:: I entirely agree with you.

Socrates:: I have now mentioned three classes, if you observe.

Protarchus:: I think I understand which you mean. For one I think you mean the Unlimited: for another Limit. For the third I am not quite sure what you mean.

Socrates:: Because its multiplicity bewilders you, my friend. However, the Unlimited was a numerous family too, and yet when it was stamped with the generic impress of More and Less, we had no doubt of its unity. Limit, to be sure, did not include many members, and we had no difficulty in admitting its unity.

Protarchus:: How could we have?

Socrates:: How, indeed? However, when I speak of a third class, I reduce to unity the Offspring of the other two, all births into being from the introduction of Limit and Measure.

Protarchus:: Now I understand.

Socrates:: It remains to be inquired what the fourth class is that we spoke about. And you must help me in the inquiry; and tell me if you think that whatever is produced must he produced by a Cause?

Protarchus:: I do. How else could it be produced?

Socrates:: And Cause only differs in name from Maker? And Cause and Maker may be said to be one?

Protarchus:: They may.

Socrates:: And similarly we shall find that what is produced and what is made only differ in name?

Protarchus:: We shall.

Socrates:: And the Maker naturally precedes, and the birth of what is made follows?

Protarchus:: It does.

Socrates:: Cause, then, and what contributes to production as the slave of Cause, are distinct, and not identical?

Protarchus:: Certainly.

Socrates:: The things that are produced and the things out of which they are produced made up together the three classes?

Protarchus:: They did.

Socrates:: Shall we call the artificer of them, the Cause, a fourth class, assuming its distinctness proved?

Protarchus:: Yes.

Socrates:: As we have distinguished four classes, it may be as well to impress them on our memory by recounting them in order.

Protarchus:: Certainly.

Socrates:: I make the Unlimited the first class, Limit the second, Compound and Produced Being the third, and shall I be wrong if I call the Cause of composition and production the fourth?

Protarchus:: Ton will not be wrong.

Socrates:: Come now, what is next to be said, and what was our design in taking this line of inquiry? Was it not this? We were inquiring whether the second prize would belong to Pleasure or to Wisdom, were we not?

Protarchus:: We were.

Socrates:: Will the classification we have made assist ns in deciding the first and second prize we were disputing about?

Protarchus:: Perhaps.

Socrates:: Come: we assigned the first prize to the Mixed life, combining both Pleasure and Wisdom, did we not?

Protarchus:: We did.

Socrates:: Well, of course we can have no difficulty about the character of this life, and the class to which it belongs?

Protarchus:: Of course not.

Socrates:: And we shall put it with others into the third class, I imagine. For that class is not composed of any two particular ingredients, but of all the Limitless class subdued and coerced by Limit. So that the victor life will only be one of its members.

Protarchus:: True.

Socrates:: Good; and how about your life, Philebus, pleasant and unmixed? In which class should it be placed? But before giving your opinion, first answer me these questions.

Philebus:: Put them.

Socrates:: Is Limit inherent in Pleasure and Pain, or are they of the class susceptible of augmentation and diminution?

Philebus:: Yes, Socrates, they are of the class susceptible of augmentation. For were Pleasure Limited in number or degree she could not be the absolute Good.

Socrates:: Nor Pain, Philebus, absolute evil. So we must find something else than its Unlimited character to impart goodness to Pleasure. Well; let Pleasure be reckoned of the class of the Limitless: to which class, Protarchus and Philebus, can we refer Wisdom, and Science, and Reason, without impiety? For it seems to me of momentous import whether we make a right or wrong decision.

Philebus:: You magnify your god, Socrates.

Socrates:: And so do you yours, Philebus. Still this query must be answered.

Protarchus:: Socrates says truly, Philebus, and we must do as he bids.

Philebus:: Well, have hot you undertaken to be spokesman in my stead, Protarchus?

Protarchus:: I have. However, I now am fairly at a loss; and I beg you, Socrates, to perform the function of prophet yourself, that we may pronounce no false judgment on this claimant, or say anything that should not be said.

Socrates:: I must do as you bid me, Protarchus; and, indeed, you do not impose a difficult task. But did my jocose magnifying, as Philebus called it, really discompose you, Protarchus, when I asked you what is the class of Reason and Science?

Protarchus:: Indeed it did, Socrates.

Socrates:: And yet the answer is easy. For all the wise agree, magnifying themselves indeed, that Reason is the lord of heaven and earth. And, peradventure, they say truly. But if you like, we will investigate its class at greater length.

Protarchus:: Proceed as you think best, and never mind the length on our account, for we shall not quarrel with you, Socrates.

Socrates:: Very well, then let us begin with some such question as this:—

Protarchus:: What?

Socrates:: Shall we hold, Protarchus, that the All and what we call the universe is subject to an irrational and undesigning power and the play of chance, or, as older generations said, is arranged and controlled by some Reason and marvelous Wisdom?

Protarchus:: Surely we need not merely re-echo what others have said. The first alternative, I think, is absolutely profane; but that Reason orders everything is a doctrine proclaimed by the aspect of the world, and sun, and moon, and stars, and revolving heavens; and I will never utter or believe any other.

Socrates:: Shall we, then, make a profession of faith, and say, with former generations, that it is so; and, not content with merely repeating the assertions of others without risk to ourselves, shall we take our share of danger and reproach attaching to the creed when talented men contradict it, and teach that the universe is destitute of arrangement?

Protarchus:: Yes, we will.

Socrates:: Now observe the next stage of the argument.

Protarchus:: Point it out.

Socrates:: The elements in the bodies of all animals, water, and fire, and air, and earth, may be discovered like land in a storm, as the saying is, in the frame of the universe.

Protarchus:: They may; and in truth I am out of my reckonings, and tost in a storm of perplexity.

Socrates:: Well, next remark this about all the elements of our bodies.

Protarchus:: What?

Socrates:: They all exist in us small in quantity, base in quality, and impure in condition, and by no means with powers commensurate to their nature. Observe this in any one instance, and then generalize. For instance, there is fire in our bodies and fire in the universe.

Protarchus:: There is.

Socrates:: Well, ours is small, and weak, and base; but that in the universe is marvelous in mass and beauty and every igneous virtue.

Protarchus:: Very true.

Socrates:: Well now, is the fire of the universe fed, and lit, and governed by the fire in us, or, on the contrary, is the fire in you, and me, and other animals, dependent on the fire in the universe?

Protarchus:: Such a question does not merit an answer.

Socrates:: You are right. And you will answer the same, doubtless, as to the earth in our bodies and the earth of the universe: and so of all the other elements which I just now asked about.

Protarchus:: Who could answer otherwise and be thought in his senses?

Socrates:: Who, indeed? But observe what follows. When we found these elements united in a single mass, we called the mass a body.

Protarchus:: We did.

Socrates:: Do the same with this that we call the world. For by parity of reason it must be a body, being a composition of the same elements.

Protarchus:: Doubtless.

Socrates:: Was our body originally, and is it still, indebted for nutriment, and the other influences that we mentioned, to the body of the universe; or, on the contrary, is that indebted for them to ours?

Protarchus:: This is another question, Socrates, that does not merit an answer.

Socrates:: Well, does this, then, or does it not?

Protarchus:: First ask it.

Socrates:: Shall we say that our body has a soul?

Protarchus:: Certainly.

Socrates:: And whence could it derive it, Protarchus, unless the body of the universe, composed, as it is, of the same elements as ours, and those in all respects more beautiful, also has a soul?

Protarchus:: Clearly nowhere else but hence, Socrates.

Socrates:: For I imagine, Protarchus, we do not believe that Cause, which enters everywhere as a fourth principle along with Limit, Unlimited, and Composition, gave our own bodies soul, and the art of maintaining health and of curing disease, and is elsewhere present organizing and repairing in various ways under the various names of Wisdom; and yet that, though these same principles exist both in the whole heavens and in large divisions of them, exist, too, beautiful and pure, in these regions Cause has not assumed the form of Wisdom contriving what is most beautiful and excellent.

Protarchus:: That would be very improbable.

Socrates:: Well, if this is not true, it will be better to hold, as we have several times suggested, that there is not only much Unlimited in the universe, and Limitation commensurate, but also a presiding Cause of no contemptible power, that orders and arranges years, and seasons, and months, and may justly be named Reason and Wisdom.

Protarchus:: Most justly.

Socrates:: But Wisdom and Reason can only be imparted to soul.

Protarchus:: True.

Socrates:: In the frame of Jove, then, you will say the might of Cause engenders a kingly soul and a kingly Reason, and other gods will be rightly called by such names as they may choose.

Protarchus:: True.

Socrates:: Do not think these remarks idle; for on the one hand they justify those men of old who proclaimed Reason the ruler of the universe:—

Protarchus:: Most true.

Socrates:: And on the other they furnish an answer to my question, namely, that Reason is of the family of the universal Cause, which was one of our four classes. For now, of course, you have my answer.

Protarchus:: So I have; and yet I did not notice that you had given it.

Socrates:: It is refreshing, Protarchus, to intermix work with occasional play.

Protarchus:: It is.

Socrates:: We now then have tolerably explained the class and function of Reason.

Protarchus:: We have.

Socrates:: And we had before ascertained the class to which Pleasure belongs.

Protarchus:: True.

Socrates:: Let us then remember that Reason is akin to. Cause and seemingly of this class, and Pleasure is Unlimited and of the class that neither has nor can have in itself beginning, middle, or end.

Protarchus:: We cannot help remembering this.

Socrates:: Well, we must next inquire where each is seated, and what produces them. And first of Pleasure. For as we investigated her class first, so on these points we must begin with her; and we cannot adequately investigate Pleasure without also investigating Pain.

Protarchus:: If this is the right road, let us take it.

Socrates:: Do you agree with me about their origin?

Protarchus:: In what?

Socrates:: I think both Pain and Pleasure naturally have their seat in the Mixed class.

Protarchus:: Pray, remind us, my friend, which you mean by the Mixed.

Socrates:: I will, my fine fellow, as well as I can.

Protarchus:: Thanks.

Socrates:: By the Mixed class let us understand the one we placed third on the list.

Protarchus:: The one you mentioned after the Unlimited and Limit, and in which you included health and harmony, I think?

Socrates:: Quite right, and now give me your attention.

Protarchus:: Proceed.

Socrates:: I say the dissolution of harmony in an animal frame is the dissolution of its being and the birth of Pain.

Protarchus:: Very likely.

Socrates:: And the restoration of harmony and the reintegration of its being is the origin of Pleasure, to resume the greatest matters in the shortest space and the fewest words.

Protarchus:: I believe you are right, Socrates; but be plainer if you can.

Socrates:: Well; are not the commonest phenomena the plainest?

Protarchus:: Which?

Socrates:: Is not hunger a disintegration and a Pain?

Protarchus:: Yes.

Socrates:: And eating a reintegration and a Pleasure?

Protarchus:: Yes.

Socrates:: And thirst is a desiccation and a Pain, and the re-irrigation of what was dried by thirst a Pleasure, and the dispersion by heat and dissolution of what was naturally united is a Pain, and its recombination in the natural state by cold is a Pleasure.

Protarchus:: Certainly.

Socrates:: And the unnatural solidification of the animal liquids by cold is a Pain, and the fusion by heat and return of the elements to their natural position is a Pleasure. And is it not a universal truth that the disorganization of the animated world, formed as we said of a Limitless and Limit, is Pain, and the renovation of the normal state is Pleasure?

Protarchus:: We will assume it to be so. It is at all events an approximation to the truth.

Socrates:: Let us then reckon one kind of Pleasure the result of the processes we have described.

Protarchus:: Agreed.

Socrates:: Let us next assume that the expectation of Pleasure, when the soul in its separate action anticipates these processes, is hope and pleasurable, and the expectation of Pain is fear and painful.

Protarchus:: Yes. Here we have another kind of Pleasure and Pain, confined to the soul, and produced by expectation.

Socrates:: Right. And I believe that the examination of these two kinds, unalloyed, as is supposed, and not mixtures of Pleasure and Pain, will show whether the whole genus of Pleasure is desirable, or whether we must ascribe such a character to some other genus; and to Pleasure and Pain the same as to heat and cold, and things of this kind—namely, that of being sometimes desirable, and sometimes undesirable; as being not Good, but occasionally, in some instances, susceptible of goodness.

Protarchus:: You are right, I think, that the solution we are hunting for is to be found in this track.

Socrates:: First, let us observe that if it really happens, as I said, that Pain follows upon the dissolution of the vital harmony, and Pleasure upon its restoration; let us consider what is the state of those whose frame is neither impaired nor renovated. And think before you answer. Is it not an inevitable conclusion that an animal in that case feels neither Pain nor Pleasure, great or small?

Protarchus:: It is.

Socrates:: Here, then, is a state of mind distinct from Pleasure and Pain.

Protarchus:: There is.

Socrates:: Well, try to remember this. It will be of no small moment whether we remember it or not, when we come to judge of Pleasure. And, if you please, we will determine a point about it.

Protarchus:: What, pray?

Socrates:: Do you see that there is nothing to prevent a man who chooses a life of Wisdom from Living in this condition?

Protarchus:: Neither rejoicing nor pained, you mean?

Socrates:: Yes. For we observed when we were comparing the two lives, that he who chose the life of Reason and Wisdom must forego every Pleasure, great and small.

Protarchus:: We did.

Socrates:: Well, this would be the manner of his life, and perchance it would not be strange if of all lives it were the most godlike.

Protarchus:: At all events, it is not likely that gods feel Pleasure or Pain.

Socrates:: It is not. For both are unseemly. But we will consider this hereafter, if it is relevant to the discussion, and will reckon it among the claims of Reason to the second rank, if we must renounce its claim to the first.

Protarchus:: Right.

Socrates:: Now, the second kind of Pleasure which we ascribed to the soul alone owes its origin entirely to Memory.

Protarchus:: How?

Socrates:: It seems we must first inquire what Memory, and, previously, what Sensation is, if we mean to investigate the matter thoroughly.

Protarchus:: How do you mean?

Socrates:: Assume that the affections that happen from time to time to the body sometimes expire before they reach the soul and leave her unaffected, at other times traverse both soul and body, and communicate a shock to both and each.

Protarchus:: Assumed.

Socrates:: If we say that whatever does not permeate both escapes the notice of the soul, and what permeates both strikes her notice, shall we be right?

Protarchus:: We shall.

Socrates:: By escape from notice, do not take me to mean the fact of being forgotten. For forgetting is losing a Remembrance; but in what we have mentioned as yet, we have not shown the birth of Remembrance, and to talk of the loss of that which is not yet born or in existence would be premature, would it not?

Protarchus:: It would.

Socrates:: Then merely change the term.

Protarchus:: How?

Socrates:: When the soul is unaffected by the shock of the body, do not talk of its escaping the notice of the soul, which you say would mean being forgotten, but say the soul is insensible to the shock.

Protarchus:: I see what you mean.

Socrates:: And if you call the impression on the soul, when it shares the affection and shock of the body, Sensation, you will be right.

Protarchus:: Very true.

Socrates:: Now, then, we understand what we mean by Sensation.

Protarchus:: We do.

Socrates:: If a man call Memory the retention of a Sensation, he will define it rightly, I think.

Protarchus:: He will.

Socrates:: And we distinguish between Recollection and Memory, do we not?

Protarchus:: I think we do.

Socrates:: And this is what we mean by the former:—

Protarchus:: What?

Socrates:: When the soul alone, and as far as possible without the intervention of the body, revivifies the impression she shared with the body, we say she recollects, do we not?

Protarchus:: We do.

Socrates:: And when she loses the Remembrance of a Sensation or a perception, and afterwards recovers it without assistance, we call the recovery Recollection and Remembrance, I fancy.

Protarchus:: Just so.

Socrates:: The object of all these remarks is this:—

Protarchus:: What?

Socrates:: To see mental Pleasure as pure from bodily influence, and as distinctly as possible, and also Desire; for they will assist us in both these endeavors.

Protarchus:: Let us go on, Socrates.

Socrates:: We have, indeed, many questions to consider when we discuss the origin of Pleasure and her general character. For now apparently we have first to ascertain the nature and locality of Desire.

Protarchus:: Let us make the inquiry, for we can lose nothing by it.

Socrates:: On the contrary, Protarchus, we shall lose, and that by succeeding in our quest, our present ignorance.

Protarchus:: Well rejoined; but let us try to make another step.

Socrates:: Well, we said just now that hunger and thirst, and many other things of the sort, are Desires..

Protarchus:: We did.

Socrates:: What is it that we recognize as identical in things so widely different when we call them by the same name?

Protarchus:: By Jove, it is not easy, though necessary, to say.

Socrates:: Let us start from the same point and the same examples.

Protarchus:: From what point?

Socrates:: We speak of a creature thirsting sometimes.

Protarchus:: To be sure.

Socrates:: And that means being empty?

Protarchus:: No doubt.

Socrates:: And thirst is a Desire?

Protarchus:: Yes, of liquid.

Socrates:: Liquid, or replenishment with liquid?

Protarchus:: Replenishment, I imagine.

Socrates:: So, then, a man is empty, and desires the condition opposite to his actual condition. For inanition is his actual condition, and he desires replenishment.

Protarchus:: Exactly.

Socrates:: Well; can he who is empty for the first time have either by Sensation or Remembrance any apprehension of replenishment, an affection that he neither now experiences nor ever before?

Protarchus:: How can he?

Socrates:: But we allow that he who desires, desires some object.

Protarchus:: He does.

Socrates:: He therefore does not desire what he feels, for he feels thirst, and this is inanition, and what he desires is replenishment.

Protarchus:: Yes.

Socrates:: It must be that something in the thirsty man apprehends replenishment.

Protarchus:: It must.

Socrates:: The body cannot, for it is empty.

Protarchus:: True.

Socrates:: It remains, then, that the mind apprehends it, and that by Remembrance; for how else can it?

Protarchus:: In no other way, I think.

Socrates:: Do you see what follows?

Protarchus:: What?

Socrates:: What we have said proves that Desire is not in the body.

Protarchus:: How?

Socrates:: Because it shows that every living being desires the opposite condition to the actual condition of the body.

Protarchus:: Very true.

Socrates:: And Desire, in aiming at the opposite of the bodily affection, indicates a Remembrances of that opposite.

Protarchus:: It does.

Socrates:: And these considerations, by showing that it is Remembrances which presents to us the object of Desire, prove that Volition, and Desire, and the government of the body, belong entirely to the soul.

Protarchus:: They do.

Socrates:: Our argument by no means admits that thirst, or hunger, or any other affection of the sort, belongs to the body.

Protarchus:: No.

Socrates:: Now, let us make another observation on the same matter. Our inquiry seems to me to aim at elucidating a peculiar kind of life made up of these very affections.

Protarchus:: What affections and life do you mean?

Socrates:: I mean the affections of repletion and inanition, and all processes tending to the conservation or destruction of the animal frame, and the Pleasures or Pains that may be felt in these processes.

Protarchus:: Such is its aim.

Socrates:: And what happens when a man is in an intermediate state?

Protarchus:: What intermediate state?

Socrates:: Why, pained by the affection, and remembering the pleasant process by which he might be relieved, but not as yet relieved. How is he then? Shall we say he is in the intermediate state?

Protarchus:: Yes.

Socrates:: Wholly pained or wholly pleased?

Protarchus:: Not the latter, by Jove, but doubly pained, in body by the affection, in mind by an expectant craving.

Socrates:: How doubly pained, Protarchus? When any of us is in a state of inanition, has he not sometimes a sure hope of repletion, and sometimes none?

Protarchus:: True.

Socrates:: Well, when he hopes to be filled, do you not suppose that he is pleased by the remembrance, though at the same time he is pained by the inanition?

Protarchus:: No doubt he is.

Socrates:: Under these circumstances, then, man and other animals are simultaneously pained and pleased.

Protarchus:: It seems so.

Socrates:: But how if a man is in a state of inanition with no hope of repletion? Is not that the occasion of the double pang which just now you foresaw and thought was the single result?

Protarchus:: It is, Socrates.

Socrates:: Let us apply our insight into these affections thus.

Protarchus:: How?

Socrates:: Shall we say that these Pains and Pleasures are true or false, or sometimes true and sometimes false?

Protarchus:: How can Pleasures or Pains be false, Socrates?

Socrates:: How, Protarchus, can fears be true or false, or expectations true or false, or opinions true or false?

Protarchus:: Opinions may be, I allow, of course, but not the rest.

Socrates:: What is that you say? We seem to be mooting a serious question.

Protarchus:: We are.

Socrates:: But is it relevant to our previous discussion, oh disciple of the philosopher yonder? That is the question.

Protarchus:: Perhaps it is.

Socrates:: Irrelevant discussions, long or short, must be absolutely declined.

Protarchus:: They must.

Socrates:: Now tell me; for I have always wondered about this very question that we have raised.

Protarchus:: What question do you mean?

Socrates:: Is it true that Pleasures cannot be false?

Protarchus:: How can they?

Socrates:: Is it true, as you say, that no one asleep or awake, mad or beside himself, ever fancies he is pleased when he is not, or fancies he is pained when he is not?

Protarchus:: We all think it is true, Socrates.

Socrates:: Are you right, or shall we discuss whether it is true or not?

Protarchus:: We had better discuss it, I should say.

Socrates:: Let us define, then, the question about Pleasure and Opinion more exactly. We have an Opinion sometimes, have we not?

Protarchus:: Yes.

Socrates:: And are pleased?

Protarchus:: Yes.

Socrates:: And Opinion implies a proposition?

Protarchus:: Yes.

Socrates:: And Pleasure a cause?

Protarchus:: It does.

Socrates:: Well, he that has an Opinion, be it true or false, still has a real Opinion.

Protarchus:: He has.

Socrates:: So, too, he that is pleased, whether rightly or wrongly, is clearly nevertheless really pleased.

Protarchus:: He is.

Socrates:: How is it, then, that Opinion can be true or false, but Pleasure only true, though both are equally real?

Protarchus:: We must examine.

Socrates:: Do you say we must examine because Opinion admits of truth and falsehood and is thus not merely Opinion, but Opinion with a certain quality?

Protarchus:: Yes.

Socrates:: And we must convince ourselves whether in general it is only other things that have qualities, but Pleasure and Pain are solely what they are, and absolutely devoid of quality.

Protarchus:: We must.

Socrates:: However it is clear that they have qualities, for we agreed just now that both Pleasures and Pains are great and small, and keen and dull.

Protarchus:: True.

Socrates:: And if badness should attach to either, Protarchus, we will say there is such a thing as a bad Opinion or a bad Pleasure.

Protarchus:: Of course, Socrates.

Socrates:: And how if rightness or the opposite attaches to either, shall we not call the Opinion to which rightness attaches a right Opinion, and so of Pleasure? And if a proposition is wrong, we cannot say that Opinion which wrongly adopts it is right or opines rightly.

Protarchus:: How can we?

Socrates:: Well now, if we find that any Pain or Pleasure is wrong in respect of its cause, can we call it right or good, or by any eulogistic name?

Protarchus:: We cannot, if a Pleasure can be wrong.

Socrates:: Why, I suppose we often have a Pleasure accompanied with no right but a false Opinion.

Protarchus:: Granted; and we then call the Opinion false, but never the Pleasure itself.

Socrates:: Oh, oh, Protarchus! you are a zealous advocate of the cause of Pleasure.

Protarchus:: Oh, no! I only say what is the usual mode of expression.

Socrates:: But is there no difference, my friend, between Pleasure accompanied with a right Opinion and knowledge, and Pleasure attended with ignorance and false Opinion?

Protarchus:: There ought to be a considerable difference.

Socrates:: Well, let us proceed to look at the difference.

Protarchus:: Take any line you think best Socrates: Shall I take this, then?

Protarchus:: Which?

Socrates:: We agree that Opinions may be true or false?

Protarchus:: We do.

Socrates:: And both of them, true and false Opinion, I mean, are, as we just now said, accompanied with Pleasure and Pain.

Protarchus:: Certainly.

Socrates:: Well, the sources of all our Opinions and opinionative reasonings are Memory and Sensation.

Protarchus:: True.

Socrates:: Well, do you not think this is what we experience when we form an Opinion?—

Protarchus:: What?

Socrates:: When a man sees certain objects not very clearly from a distance, it may often happen, you will allow, that he should wish to determine what it is he sees.

Protarchus:: To be sure.

Socrates:: Well; would not such a one then ask himself this question?—

Protarchus:: What question?

Socrates:: What on earth is that figure that seems to stand beside a rock yonder under a tree? Would he say this to himself, do you think, if he descried some appearance of the sort?

Protarchus:: Doubtless.

Socrates:: Well; and then he might answer himself, It is a man; and this might be true.

Protarchus:: To be sure.

Socrates:: And he might be mistaken, and think that what he saw was the workmanship of shepherds, and call it a statue.

Protarchus:: He might.

Socrates:: And if any one were by, he might breathe what he said to himself into voice, and speak it to his neighbor, and what we called an Opinion would thus become a Speech or proposition.

Protarchus:: It would.

Socrates:: But if he is alone, sometimes he goes away with the belief in his mind, and retains it a long time.

Protarchus:: No doubt.

Socrates:: Well; does the occurrence appear to you in the same shape as to me?

Protarchus:: In what shape?

Socrates:: Our soul then seems to me to be like a book.

Protarchus:: Why?

Socrates:: Memory and Sensation combining, and the faculties connected with them, seem to me at such a time to write down, as it were, propositions in our minds; and when what the affection writes is true, we have true Opinions and true internal propositions; but when the scribe writes down what is false we have the opposite of the true.

Protarchus:: So I think, and I agree to what you say.

Socrates:: Agree, too, that there is also another artist then at work in the soul.

Protarchus:: What artist?

Socrates:: A painter that, after the scribe has written, paints in the soul pictures representing the subject of his statements.

Protarchus:: How and when do you mean?

Socrates:: When a man, besides carrying away from a sight or other sensation those Opinions and propositions, somehow sees in himself the picture of what he believed and said. This happens in our souls, does it not?

Protarchus:: Very often.

Socrates:: Well; the images of the true Opinions and statements are true, and those of the false ones false, are they not?

Protarchus:: They are.

Socrates:: Well, then, let us next inquire this:—

Protarchus:: What?

Socrates:: Do we judge thus in reference to the present and past only, and not in reference to the future?

Protarchus:: No; we make similar judgments in reference to every time.

Socrates:: Well; mental Pleasures and Pains, we said just now, sometimes precede bodily Pleasures and Pains, so that we must allow that Pleasure and Pain sometimes refer to the future.

Protarchus:: We must.

Socrates:: Do the writings and pictured then that we said just now were made in our minds relate to the past and present only, and not to the future?

Protarchus:: Very much the reverse.

Socrates:: You say, very much the reverse, I suppose, because all such pictures are Hopes, whose domain the future is, and man is all his life constantly full of Hopes.

Protarchus:: Certainly.

Socrates:: Now answer me further.

Protarchus:: What?

Socrates:: A righteous, and pious, and otherwise virtuous man is beloved by the gods, is he not?

Protarchus:: No doubt.

Socrates:: And the unrighteous and otherwise bad is hated by them?

Protarchus:: He must be.

Socrates:: But every man, as we said just now, is full of various Hopes.

Protarchus:: True.

Socrates:: And what we called Hopes are internal propositions.

Protarchus:: Yes.

Socrates:: And paintings of the fancied scenes. And a man often sees immense wealth coming to his hands and much attendant Pleasure, and sees among other figures himself pictured rejoicing greatly over his happy fortune.

Protarchus:: He does.

Socrates:: Of these characters shall we say that those traced on the souls of the virtuous are generally true, because the virtuous are loved by the gods, and those on the souls of the vicious the reverse; or how?

Protarchus:: As you say.

Socrates:: Well, the vicious have pictured Pleasures as well as the virtuous, and these, I suppose, are false.

Protarchus:: Doubtless.

Socrates:: False Pleasures, therefore, gladden the vicious, and true the virtuous.

Protarchus:: It must be so.

Socrates:: There are, then, from what has been said, false Pleasures in the souls of men, ludicrous caricatures of the true, and Pains of the same description.

Protarchus:: There are.

Socrates:: Well, we agreed that a man always has a real Opinion who has an Opinion at all, though sometimes of things that are not, nor ever have been or will be.

Protarchus:: He has.

Socrates:: And I fancy these are the things that then cause false Opinion and false opining.

Protarchus:: They are.

Socrates:: Well, must we not, to complete the parallel, ascribe an analogous position to Pleasure and Pain in respect of those predicates?

Protarchus:: What position?

Socrates:: The man really rejoices who rejoices at all, and anyhow, and on whatever ground, though occasionally at what are not realities, past or present, and often, and most frequently, perhaps, at what never will become realities.

Protarchus:: This must also be the case, Socrates.

Socrates:: And we may say the same of fears, and angers, and all such passions: they are all occasionally mistaken.

Protarchus:: Undeniably.

Socrates:: Well; is the badness or goodness of Opinions produced by any other assignable cause than their falsity?

Protarchus:: No.

Socrates:: And for the badness of Pleasures we can detect no other reason, I fancy, than their being false.

Protarchus:: Quite the contrary, Socrates. For falsity can hardly be assigned as the cause why Pleasures and Pains are bad, but many other enormous badnesses that they are obnoxious to.

Socrates:: The bad Pleasures that are such from other badnesses shall be examined presently, if we still think proper. That false Pleasures of various kinds frequently exist, and are produced in our minds, shall now be shown by another proof. For we may perhaps use this fact in the comparison we are to make.

Protarchus:: Certainly, if there are any such.

Socrates:: Well, there are, Protarchus, in my opinion; but until this fact is ascertained, of course it must not cease to be examined.

Protarchus:: Good.

Socrates:: Then let us stand up like athletes to this new argument.

Protarchus:: Let us begin.

Socrates:: We said, if you remember, a little while ago, that in Desire the body and the mind are divided and isolated in their affections.

Protarchus:: I remember we said so.

Socrates:: Well; it was the soul that desired a condition opposite to the body's actual condition, and the Pain or Pleasure resulting from some affection was caused by the body.

Protarchus:: True.

Socrates:: Then draw the conclusion that results from this.

Protarchus:: Tell me what it is.

Socrates:: It results that, under these circumstances, there are simultaneous Pains and Pleasures in juxtaposition, and simultaneous perceptions of these opposites, as appeared just now.

Protarchus:: It seems so.

Socrates:: Well; this was also said, and is a premise we have already agreed upon:—

Protarchus:: What?

Socrates:: That both of them, Pleasure and Pain, admit of degrees, and are Unlimited.

Protarchus:: So we said, no doubt.

Socrates:: How is it possible, then, to measure rightly their comparative quantity.

Protarchus:: How, and in what respect?

Socrates:: If the object of our measurement is to decide this kind of question, which is the greater, and which the less, and which more intense and violent, taking Pain and Pleasure, or Pain and Pain, or Pleasure and Pleasure.

Protarchus:: That is certainly the question and the object of comparison.

Socrates:: Now in ocular perception the distance or proximity of the bulk surveyed obscures the truth and falsifies Opinion: will the same thing happen in estimating Pains and Pleasures?

Protarchus:: Yes; in a far greater degree, Socrates.

Socrates:: The phenomenon that we now observe is the converse of the phenomenon we observed a little while ago.

Protarchus:: What do you allude to?

Socrates:: Then the Opinions were themselves true or false, and infected the Pains and Pleasures with their own quality.

Protarchus:: True.

Socrates:: Now, it is the latter whose varying proximity and distance and juxtaposition while under survey falsifies the Opinions, Pleasure appearing greater and intenser beside Pain, and Pain, in the same way, beside Pleasure.

Protarchus:: This happens from the causes you mention.

Socrates:: Now, if the excess or defect of the apparent above or below the real magnitude, the imaginary but unreal portion, be cut off from each, this imaginary Pleasure or Pain is wrong, you will allow, and no Pleasure or Pain that it causes can be right or true.

Protarchus:: It cannot.

Socrates:: If we next proceed to another point of view we shall discover apparent and real Pleasures and Pains still falser than these.

Protarchus:: What point of view and what Pleasures?

Socrates:: I think we have said more than once that when the animal frame is impaired by combination or separation, repletion or inanition, increase or decrease, Pain and uneasiness, and the things denoted by this sort of name, are the result.

Protarchus:: We have said so several times.

Socrates:: And when the normal state is restored, we agreed that the restoration is Pleasure.

Protarchus:: We did.

Socrates:: And what results when the body undergoes neither change?

Protarchus:: When can that be, Socrates?

Socrates:: That is an irrelevant question, Protarchus, that you ask.

Protarchus:: Why so?

Socrates:: Because it does not prevent me from asking my own question again.

Protarchus:: Which?

Socrates:: Granting it never happens, Protarchus, I shall answer, what would be its necessary result if it did?

Protarchus:: If the body underwent neither change, do you mean?

Socrates:: I do.

Protarchus:: It is plain, Socrates, that under these circumstances neither Pleasure nor Pain would arise.

Socrates:: Well said. But you maintain, I suppose, that, as philosophers assert, one or other of these changes is constantly happening, as all things are whirling up and down in a ceaseless flux.

Protarchus:: So they argue, and with some force, as is thought.

Socrates:: What else would you expect from thinkers of their force? However, I would rather avoid the shock of their argument, and propose to escape by this way; and you had better escape with me.

Protarchus:: Show the way.

Socrates:: Perhaps you are right, we will say to them (and you must be their representative); but whenever a living being undergoes an affection, is it always conscious of the affection, and are we conscious of growth and all similar changes? or do not almost all these changes, on the contrary, escape our consciousness?

Protarchus:: They do.

Socrates:: It was incorrect to say that the changes upwards and downwards produce Pleasures and Pains?

Protarchus:: It was.

Socrates:: This form of the statement would be better, and less open to objection:—

Protarchus:: What form?

Socrates:: Violent changes produce Pleasures and Pains, but moderate and slight changes produce neither in the least degree.

Protarchus:: This form is more correct than the other.

Socrates:: Well, if this is so, the life we lately alluded to comes again before us.

Protarchus:: What life?

Socrates:: The life we declared to be devoid of Pain or Pleasure.

Protarchus:: True.

Socrates:: Then shall we make three lives: one pleasurable, another painful, and a third neutral; or what would you say?

Protarchus:: I say there are three lives.

Socrates:: Not to feel Pain, then, cannot be the same as to feel Pleasure.

Protarchus:: How can it?

Socrates:: But when you hear a man say that the pleasantest thing in the world is to pass one's whole life without Pain, what do you consider the speaker affirms?

Protarchus:: He seems to say that the absence of Pain is Pleasure.

Socrates:: Now take any three things you please; and, to use fair sounding names, suppose one to be gold, another to be silver, and the other neither gold nor silver.

Protarchus:: Supposed.

Socrates:: Can that which is neither gold nor silver be either gold or silver?

Protarchus:: How can it?

Socrates:: Therefore when the intermediate life is said to be pleasurable or painful, if it is thought to be so, it is not rightly thought; and, if said to be so, it is not rightly said—not, at least, in accordance with right speech.

Protarchus:: Certainly not.

Socrates:: And yet, my friend, people both say so and think so, we see.

Protarchus:: They do.

Socrates:: Do they imagine they are actually pleased when they feel no Pain?

Protarchus:: They say so, at all events.

Socrates:: They imagine, then, that they are pleased, or else they would not say so, I presume?

Protarchus:: So it seems.

Socrates:: They have a false opinion, though, about Pleasure, if there is a difference between Pleasure and the absence of Pain.

Protarchus:: And we agreed that there was a difference.

Socrates:: Then shall we settle that they are three, as we said a little while ago, or only two—Pain, the evil of man, and freedom from Pain, identical with his Good, and synonymous with Pleasure?

Protarchus:: How can this be still an open question, Socrates? I do not understand you.

Socrates:: It is plain, Protarchus, that you are unacquainted with the adversaries of our friend Philebus.

Protarchus:: Whom do you mean?

Socrates:: Why, persons said to be very great in physical science, who deny the reality of Pleasure altogether.

Protarchus:: How can they?

Socrates:: They say that what the school of Philebus calls Pleasure is deliverance from Pain.

Protarchus:: Would you have me believe them, Socrates, or not?

Socrates:: No, but I would have you use them as a sort of diviners, not judging by rules of divination, but by the repugnance of a noble nature, deeply hating Pleasure, and convinced that she is so far from genuine that her very power of fascinating is a magic illusion and not Pleasure. You may use them in this way, and listen to their other grounds of repugnance, and afterwards I will tell you what I think are true Pleasures; so that with both opinions to aid us we may place Pleasure in a clear light ready for the comparison.

Protarchus:: Let us do so.

Socrates:: Let us deem these persons our allies, and follow in the track of their distaste. And, I fancy, this is the sort of line they take. They set out from a maxim, and ask whether, if we wish to discover the nature of any kind of thing, of hardness, for example, we should be more likely to discover it by examining the hardest bodies, or others of a comparatively fractional degree of hardness. Give an answer, Protarchus, not only to me, but also to these fastidious spirits.

Protarchus:: I will, and I answer them that we ought to examine the highest degrees of hardness.

Socrates:: If, then, we wish to discover the nature of Pleasure, we must not examine fractional degrees of Pleasure, but what are called the extremest and intensest.

Protarchus:: Every one will allow this.

Socrates:: Are the common Pleasures, which are proverbially the greatest, those of the body?

Protarchus:: Undoubtedly.

Socrates:: Are the higher degrees found and produced in sickness or in health? And beware of answering hastily and wrongly.

Protarchus:: How?

Socrates:: We might, perhaps, answer in health.

Protarchus:: We very likely should.

Socrates:: Well, but are not those the greatest which are most desired?

Protarchus:: No doubt of that.

Socrates:: And do not persons in fever and similar sicknesses suffer more from cold and thirst, and in all their bodily affections feel not only a greater craving, but greater Pleasure when their craving is satisfied? Or do you deny the truth of this?

Protarchus:: No; it seems true as you state it now.

Socrates:: Well, does it seem true to say that he who wants to examine the greatest Pleasures must not look for them in health but in sickness? And do not suppose me to mean by my question whether a greater number of Pleasures is to be found in sickness or in health, but to ask about the magnitude of Pleasures, and where most intensity of degree is to be found. For, remember, we have to discover the nature of Pleasure, and the value of the doctrine that altogether denies her reality.

Protarchus:: I think I see what you mean.

Socrates:: You will show that better presently, Protarchus, for you shall answer me. Has a life of profligacy the greater Pleasures, I do not mean in number, but in intensity and degree, or a life of temperance? Think well before you answer.

Protarchus:: I understand you, and I find there is no comparison; for the temperate, no doubt, are checked even by the proverbial rule that forbids too much, and obey its warning; but fools arid profligates are excited even to madness by the excessive Pleasures that make them a byword.

Socrates:: Good; and if so, it clearly is in a bad state of soul and body, not in the right state, that the greatest Pleasures and the greatest Pains are to be found.

Protarchus:: It is.

Socrates:: Well, we must take some of them in hand, and see what other characters accompany the preeminent greatness that we ascribe to them.

Protarchus:: We must.

Socrates:: Examine, then, the Pleasures of this kind of malady, and observe their character:—

Protarchus:: What maladies?

Socrates:: The Pleasures of the unseemly maladies, which the fastidious ones we mentioned view with unqualified hate.

Protarchus:: Which?

Socrates:: Friction to ease cutaneous affections and other ailments that require no other surgery. For what, in heaven's name, should the sensation that is produced be called? Pleasure or Pain?

Protarchus:: Some complicated evil, Socrates, seems to be produced.

Socrates:: Of course I do not allude to them as controverting Philebus. But without looking at these and similar Pleasures, Protarchus, we shall hardly be able to solve the problem.

Protarchus:: If so, let us scrutinize the Pleasures of this sort.

Socrates:: You mean the Mixed Pleasures that partake of Pain?

Protarchus:: Yes.

Socrates:: Well, some mixtures belong exclusively to the body, others to the mind, and a third set are common to the mind and body—Mixed Pleasures and Pains, denominated collectively sometimes Pain and sometimes Pleasure.

Protarchus:: Give me an instance.

Socrates:: During the renovation or disorganization of the frame, while opposite affections are simultaneously felt, as cold yields to warmth or warmth to cold, one condition being welcome and the other unwelcome, a so-called bittersweet mixed sensation clings most tenaciously, and produces impatience, and finally savage excitement.

Protarchus:: There is great truth in your description.

Socrates:: Well, such mixtures are sometimes made up of equal portions of Pleasure and Pain, and sometimes of one or other in excess.

Protarchus:: They are.

Socrates:: Class among the mixtures in which Pain predominates the sensations in cutaneous maladies that we mentioned, and those produced by internal irritation. There is an inward boiling and inflammation beyond the reach of rubbing and scratching, which only produce a separation on the surface; then, by exposing the external parts to fire, and passing in despair to the opposite extreme, the sufferer occasions to the inner parts excessive Pleasure, and sometimes the reverse, mixed with Pain or Pleasure, as the balance may incline, of the superficial parts, by separating what was united, or uniting what was separated, and bringing Pain and Pleasure into juxtaposition.

Protarchus:: True.

Socrates:: When, however, the Pleasure predominates in any of these affections, the slight admixture of Pain tickles and irritates gently; but Pleasure entering in much larger proportions excites the man, and even makes him leap, and pass through rapid changes of color, attitude, and respiration, uttering the strangest cries, and betraying the completest mental alienation and frenzy.

Protarchus:: So it happens.

Socrates:: And, my friend, it makes himself and others say of him that the ecstasy of Pleasure kill’s him, and he seeks these Pleasures by every means in proportion to his profligacy and folly. And he says these are the greatest, and reckons the man who lives in them most perpetually the happiest.

Protarchus:: The opinions of the common herd, Socrates, are quite what you describe.

Socrates:: Yes, about the Pleasures of the mixed states of the body alone, when there is a mixture of external and internal affections. But where the mind contributes a Pleasure or Pain opposite to that of the body, and both compose a single mixture, we said indeed before that emptiness makes repletion desired, and hope produces Pleasure and inanition Pain; but I did not assert what I now affirm, that in all this immense class of emotions the mixture of Pleasure and Pain results from the opposite states of body and mind.

Protarchus:: It seems perfectly true.

Socrates:: One of the mixtures of Pleasure and Pain still remains to be examined.

Protarchus:: Which do you mean?

Socrates:: The mixture, which we said was frequent, of purely mental sensations.

Protarchus:: And what do you now refer to?

Socrates:: Anger, and fear, and regret, and grief, and love, and rivalry, and envy, and similar emotions, are purely mental Pains, are they not?

Protarchus:: They are.

Socrates:: And have you not observed that they are full of numberless Pleasures, or must you be reminded of;

> Ire
> That moveth e’en the wise to bitter words,
> Ire far sweeter than the honey-drop:

and bereavement and melancholy, with their ‘luxury of woe?’

Protarchus:: No; this is the nature of these emotions.

Socrates:: And tragic spectacles elicit tears, while they charm, you remember.

Protarchus:: Of course.

Socrates:: And comedies, have you observed, produce a state of mind that is a mixture of Pleasure and Pain?

Protarchus:: I cannot quite recognize the truth of that.

Socrates:: Because it is not easy, I confess, Protarchus, to detect that this is always the case.

Protarchus:: I think not.

Socrates:: Let us examine it all the more for being disguised, in order that we may easier detect the mixture of Pleasure and Pain in other emotions.

Protarchus:: Proceed.

Socrates:: Is Envy, that I just now mentioned, a Pain in the mind, or what?

Protarchus:: It is a Pain.

Socrates:: But an envious man views the ills of his neighbor with Pleasure.

Protarchus:: He does.

Socrates:: And ill is the right name for ignorance and blundering.

Protarchus:: Certainly.

Socrates:: Remark now what the nature of the Ridiculous is.

Protarchus:: Say on.

Socrates:: It is one of the forms, to give its general character, of a certain vicious state of mind, with a distinctive appellation; and of all the kinds of vice it is the particular disposition opposite to the one recommended by the Delphic inscription.

Protarchus:: ‘Know thyself,’ you mean, Socrates?

Socrates:: I do. The opposite to that would be not to know one’s self, if it were recommended by the inscription.

Protarchus:: Clearly.

Socrates:: Try, Protarchus, to make a triple division of this.

Protarchus:: How do you mean? I fear I cannot.

Socrates:: Do you mean to say that I must make the division?

Protarchus:: I do; and beg you to do so.

Socrates:: Well; are there not three ways of not knowing one’s self?

Protarchus:: What three?

Socrates:: Either as to wealth, when a man thinks he is richer than he is.

Protarchus:: Many do labor under this delusion.

Socrates:: And as to their size, and beauty, and other bodily qualities, still more overstep the truth in their self-esteem.

Protarchus:: No doubt.

Socrates:: But far the most, I fancy, as to their mental qualities, appropriating virtues to which they have no claim.

Protarchus:: By far the most.

Socrates:: And of all the virtues is not wisdom the one which the mass of people most pertinaciously pretend to, and which fills them with most strife and conceited self-delusion?

Protarchus:: It is.

Socrates:: Evil surely would be a right name to give to all this kind of disposition.

Protarchus:: It would.

Socrates:: This must be subdivided into two forms, and then we shall notice a childish Envy, and witness a strange mixture of Pain and Pleasure.

Protarchus:: How can we divide it into two, as you say?

Socrates:: When this false opinion about himself is foolishly entertained, the deluded person, like the rest of the world, is either strong and powerful, or the reverse, I imagine.

Protarchus:: He must be.

Socrates:: Let this then be the division. Those that are weak and cannot avenge themselves when laughed at are properly called Ridiculous; those who can take vengeance for derision should be called objects of fear and hate. For ignorance in the powerful is hateful and repulsive, because baneful to others, both in real life and in fictitious representation; but powerless ignorance is Ridiculous, both in fiction and reality.

Protarchus:: Very true: but the mixture of Pains and Pleasures in this province is still unapparent to me.

Socrates:: First notice what Envy is.

Protarchus:: Describe it.

Socrates:: It is an unjust Pain and Pleasure, I imagine.

Protarchus:: It is.

Socrates:: Well, enemies' misfortunes may be rejoiced at without injustice or Envy.

Protarchus:: Assuredly.

Socrates:: But friends misfortunes cannot be viewed with pleasure instead of sorrow without a breach of duty.

Protarchus:: True.

Socrates:: Our friends' self-delusions about their wisdom and beauty, and the other points we mentioned when we made the three divisions, are Ridiculous when attended with weakness, and hateful when armed with power. Or shall we retract our assertion that our friends in this state of mind, when it is not baneful to their neighbors, are Ridiculous?

Protarchus:: They are Ridiculous.

Socrates:: And misfortune, we allow, is a true description of such a state of mind.

Protarchus:: It is.

Socrates:: And is Pleasure or Pain indicated by our laughter?

Protarchus:: Pleasure, clearly.

Socrates:: And Pleasure at friends' misfortunes indicates Envy as its root.

Protarchus:: It does.

Socrates:: When we laugh, therefore, at our friends' ridiculous condition, logic declares we mix Pleasure with Envy, and blend, therefore, Pleasure and Pain. For Envy, we have agreed already, is a mental Pain, and laughter Pleasure, and both are simultaneous in this emotion.

Protarchus:: True.

Socrates:: It is clear from this demonstration that mournful dirges, and tragedies, and comedies, not the scenic representations only, but real life's tragedy and comedy, give mingled sensations of Pain and Pleasure in one emotion, and ten thousand other objects have a similar power.

Protarchus:: We cannot but allow this, however reluctant we may be.

Socrates:: Anger, and desire, and sorrow, and fear, and love, and emulation, and envy, and similar emotions, were instanced just now as presenting complications of the two elements so often named, were they not?

Protarchus:: They were.

Socrates:: Do you observe that sorrow, and envy, and anger are the only emotions we have examined?

Protarchus:: They are.

Socrates:: A great many then are still remaining?

Protarchus:: A great many.

Socrates:: What induced me, do you suppose, to point out in particular that comedy excites a mixed feeling? Was it not in order to persuade you, that fear, and love, and the other emotions, could easily be shown to be mixed, and thus induce you to dispense with my examining the rest and protracting the debate, acknowledging as a universal law, that body apart from mind, and mind apart from body, and mind and body in their joint affections, are rife with complications of Pleasure and Pain? Now then, say whether you grant the dispensation, or mean to keep me arguing here till midnight? However, I have a few words to say that I think will induce you to let me off. To-morrow these other matters shall be fully examined; now I want to embark in the other considerations requisite for the comparison that Philebus enjoins.

Protarchus:: Thank you, Socrates; deal with what remains as you like.

Socrates:: In the natural order after the Mixed Pleasures we proceed by necessary sequence to the Unmixed in their turn.

Protarchus:: We ought.

Socrates:: I will try to start in a fresh direction and point them out; for those who say that Pain alleviated is the whole of Pleasure, seem to me to be mistaken. However, I use these persons, as I said, as witnesses that some Pleasures are apparent but unreal, and others which are seemingly great are really blended with Pain and alleviation of the pangs of bodily and mental distress.

Protarchus:: And true Pleasures, Socrates, which are they?

Socrates:: Those from beautiful colors, as they are called, and from figures, and most of those from odors, and those from sounds, and any objects whose absence is unfelt and painless, while their presence is sensible and productive of Pleasure.

Protarchus:: And what answer to this description?

Socrates:: I confess they are not obvious, but I will try to indicate them. By beautiful figures I do not mean what the mass of men might imagine, animal shapes or painted forms, "but straight and curved lines, says my theory, and the planes and solids they generate with turning-lathes, and rulers, and goniometers, if you understand. These have not a relative beauty, like other things, but are eternally and intrinsically beautiful, and attended with Pleasures of their own, to which those of scratching have no resemblance; and I refer to colors of a similar kind. Do you understand my meaning?

Protarchus:: I am trying, Socrates; but will you try to make it plainer?

Socrates:: I say that voices soft and clear, uttering a pure and simple note, are not relatively, but absolutely beautiful, and are linked to corresponding Pleasures.

Protarchus:: They are.

Socrates:: Odors occasion less divine Pleasures than the other things, but as to freedom from admixture of pain, and the reason of this freedom, and their seat in the soul, they may be ranked as analogous to the rest. So here, if you have followed me, are two kinds of what I call Pleasure.

Protarchus:: I have followed you.

Socrates:: To these may be added the Pleasures of knowledge, if you grant that no hunger or pangs of hunger precede their acquisition.

Protarchus:: I grant it.

Socrates:: Well, and after knowledge has filled the soul, if a man loses it by forgetfulness, do you think there is any consequent Pain?

Protarchus:: Not in the nature of things, but only from reflection, if the loss is regretted on the score of utility.

Socrates:: But, my dear friend, it is the nature of the thing that we are examining, independent of reflection.

Protarchus:: It is true, then, that no Pain attends the obliteration of knowledge.

Socrates:: Then intellectual Pleasures may be assumed to be unmixed with Pain, and the lot not of the many but of extremely few.

Protarchus:: They may.

Socrates:: Well, having broadly distinguished the pure Pleasures and the impure, as they may be named, let us call the violent devoid of Measure, and the others Measured. Only the great and violent, accordingly, belong to the class of the Unlimited and More and Less that surge through the mental and bodily world, while the others will be classed with the Measured or Limited group.

Protarchus:: This is their place.

Socrates:: This question should next be determined about them:—

Protarchus:: What?

Socrates:: Which character implies more truth: purity, and freedom from alloy; or intensity, and multiplicity, and magnitude, and abundance?

Protarchus:: What is the object of the question, Socrates?

Socrates:: To exhaust the tests of Pleasure and Science, that if they both contain a pure and an impure element, the purest of each may be admitted into the mixture, and you and I and all this company may more easily make our comparison.

Protarchus:: Very good.

Socrates:: Now purity in general may be thus regarded. And let us select a single instance as a specimen.

Protarchus:: What shall we select?

Socrates:: Whiteness, if you please, shall be first selected.

Protarchus:: Agreed.

Socrates:: What is purity of whiteness, and what white is pure? the broadest in mass and the commonest, or the most unmixed and untinged with any particle of color?

Protarchus:: Clearly the most unsullied and immaculate.

Socrates:: Assuredly; and is it not this, Protarchus, that is the truest and fairest white, and not the commonest and broadest in mass?

Protarchus:: It is.

Socrates:: A little pure white, then, compared with a larger mass that is mixed, is both the fairer and the truer, is it not?

Protarchus:: Most certainly.

Socrates:: Many similar examples, I suppose, will not be necessary to prove the proposition about Pleasure, that a small one compared with a great, and a rare one compared with a frequent, is, if unalloyed with Pain, the pleasanter, the truer, and the more beautiful.

Protarchus:: The example is sufficient.

Socrates:: Well, what do you say to this? Has not Pleasure been said to be a process of Becoming, and Being to be alien from Pleasure? Fine spirits they are that proclaim this doctrine, and deserving of our thanks.

Protarchus:: What do they mean?

Socrates:: I will explain by interrogatories, Protarchus, my friend.

Protarchus:: Begin your interrogatories.

Socrates:: Two things meet us, one self-sufficient, the other always aiming at something beyond itself.

Protarchus:: What two? and how is this their character?

Socrates:: One of sovereign state, the other of inferior rank.

Protarchus:: Explain more clearly.

Socrates:: Youthful persons, fair and good, have met your eyes, I suppose, accompanied by manly lovers.

Protarchus:: True.

Socrates:: Look for two other things related like these two in every sphere of existence.

Protarchus:: A third time I ask for explanation, Socrates.

Socrates:: I mean nothing recondite, Protarchus; the words are only a mystification, and mean that things are divided into those that are subservient to something else, and those to which something else is subservient.

Protarchus:: I just Comprehend by the help of the repetition.

Socrates:: Perhaps you will comprehend better in the progress of the discussion.

Protarchus:: It is likely.

Socrates:: Here are two other things.

Protarchus:: What are they?

Socrates:: One a process of Becoming, the other a state of Being.

Protarchus:: Two they are, I allow; Becoming and Being.

Socrates:: Well, which is subservient to the other, Being to Becoming, or Becoming to Being?

Protarchus:: Is Being subservient to Becoming, do you ask?

Socrates:: So it seems.

Protarchus:: By heavens, then, will you repeat the question?

Socrates:: This is what I ask, my Protarchus, are ships the end of naval architecture, or is naval architecture the end of ships? And wherever you find a similar relation, I ask the same question.

Protarchus:: Why do you not answer yourself, Socrates?

Socrates:: There is no reason why I should not; but you must concur in the answer. I say that some Becoming is the end of every accumulation of drugs, and instruments, and materials, and that every particular Becoming is the means to some kind of Being, and the aggregate of Becoming to the aggregate of Being.

Protarchus:: Clearly so.

Socrates:: If Pleasure, therefore, is a Becoming, it must be a means to some Being.

Protarchus:: It must.

Socrates:: Only the end, that to which the rest is subservient, is to be ranked as Good: the means must be ranked under some other class.

Protarchus:: They must.

Socrates:: If Pleasure, therefore, is a Becoming, some other class must be assigned to it than Good.

Protarchus:: No doubt.

Socrates:: Therefore, as I said when I began the subject, the man who showed that Pleasure is a Becoming, and that Being is alien to its nature, deserves our thanks; for in his view those who call Pleasure the Good must be absurdly mistaken.

Protarchus:: Of course.

Socrates:: And in his eyes all who think any Becoming the highest end must be ridiculous.

Protarchus:: What opinions and persons do you allude to?

Socrates:: Those whom the medicine of hunger and thirst, and any affections to which a process of Becoming is medicinal, delights as if it were Pleasure, and who say that life would not be worth having but for thirst and hunger and the list of similar affections.

Protarchus:: He would think them ridiculous.

Socrates:: Well, the opposite to Becoming is ceasing to be, is it not?

Protarchus:: It is.

Socrates:: Ceasing to be, then, and Becoming are the choice of the man who chooses this condition instead of the third life containing neither Pleasure nor Pain, but the purest possible Wisdom.

Protarchus:: Many absurdities seem to follow, Socrates, if Pleasure is assumed to be Good.

Socrates:: Many, indeed; and here is another that I will mention.

Protarchus:: What is it?

Socrates:: Is it not repugnant to reason that nothing Good or beautiful should exist in bodies or in anything else but the soul, and in the soul only Pleasure; and that velour, and temperance, and other goods of soul, should not be Good? And, again, that if instead of enjoying Pleasure, a man suffers Pain, he must be called Bad at the time that he suffers Pain, although he be the best of men; and that if a man is delighted, his delight at that moment is a measure of his goodness?

Protarchus:: And this, Socrates, is as opposed to reason as it can be.

Socrates:: Well, after Pleasure has been subjected to a thorough examination, Reason and Science must not be treated with more tenderness, but the flaws in their metal, if they have any, must be exposed by striking on the rim; that the purest portions being ascertained, the Perfect life may be composed of those parts of Pleasure and Science that are the truest.

Protarchus:: Right.

Socrates:: Well, production is the end of one branch of Science, I imagine, and education and culture of the other.

Protarchus:: They are.

Socrates:: Has the productive branch, we may first inquire, one element more scientific, another less, and one to be considered purer, another more impure?

Protarchus:: Let us inquire.

Socrates:: The architectonic element in each must be separated from the other.

Protarchus:: Which element? Give me an instance.

Socrates:: Separate arithmetic from any Art, and mensuration, and statics, and what remains will be insignificant, so to speak.

Protarchus:: Very insignificant.

Socrates:: The rest is guessing, and sensation sharpened by experience and practice, and a power of conjecture, sometimes denominated Art, brought by practice and assiduity to perfection.

Protarchus:: True.

Socrates:: There is a deal of this in music, accordant strings being estimated, not by measure, but by practiced conjecture. And those who handle wind instruments measure the pitch of notes by conjecture during their vibration, with a large admixture of uncertainty and little stability of result.

Protarchus:: The fact is so.

Socrates:: And medical Science, agriculture, navigation, and strategy, resemble music in character.

Protarchus:: Perfectly.

Socrates:: The Arts of building, on the contrary, from the number of measures and implements they employ, and the amount of accuracy they thus obtain, are more artificial than the majority of Sciences.

Protarchus:: Instance some.

Socrates:: Naval and domestic architecture, and many other Arts that work in wood. The ruler, of course, and turning-lathe are used, the plummet and red-line, and a certain ingenious corrector.

Protarchus:: Very true, Socrates.

Socrates:: Let us conclude there are two divisions of so-called Art. Music and its group, with less exactness of work, and architecture, with its group, attaining to more exactness.

Protarchus:: Let us establish the division.

Socrates:: And of these the most accurate elements are the Arts which we lately called architectonic.

Protarchus:: Arithmetic you mean, I think, and the Arts you joined with it.

Socrates:: I do; but there are two kinds even of these, are there not, Protarchus?

Protarchus:: What two kinds do you mean?

Socrates:: Arithmetic, to begin with that, is divided into popular and philosophic, is it not?

Protarchus:: By what principle of division can we distinguish the two kinds?

Socrates:: There is a broad distinction, Protarchus. One arithmetician counts with unequal units—two armies, two oxen, two anythings, however large or small; the other will not move a single step along with him unless every unit in ten thousand is allowed to be the exact counterpart of every other.

Protarchus:: It is indeed a broad distinction that you mention between arithmeticians, and a ground for making two species.

Socrates:: Well, are the mensuration and theory of proportion which are employed in the constructive and mercantile Arts, and the philosophic geometry and proportion, to be regarded as one species or two?

Protarchus:: After what has preceded, I should say there are two kinds of each.

Socrates:: Right; and does the object of eliciting these facts occur to you?

Protarchus:: Perhaps it does; but I should like you to give the answer.

Socrates:: I think it was its original desire of finding a division of Sciences analogous to that of Pleasures that prompted our dialectic to advance into this region, and inquire whether the Sciences differ in purity as well as the Pleasures.

Protarchus:: This is clearly the reason why it took this direction.

Socrates:: Well, has it not already ascertained that different provinces belong to different Arts, varying in certainty?

Protarchus:: It has.

Socrates:: And now, after designating an Art by an individual name, and leading us to imagine it was one, is it not going to assume it is two, and inquire whether certainty and purity in this department belong to the philosophic or the unphilosophic branch in a higher degree?

Protarchus:: I think this is the question it is going to ask.

Socrates:: What then shall we say in answer, Protarchus?

Protarchus:: There is a wonderful difference in point of exactitude in the department we are considering.

Socrates:: Then our answer will be easier.

Protarchus:: Yes; and be it said that these Sciences far surpass the first we mentioned, and that among these latter the really philosophic branches are beyond comparison superior to the rest in accuracy and truth about measures and numbers.

Socrates:: We will assume it to be as you say, and on your authority we will boldly answer the masters of misinterpretation:—

Protarchus:: What?

Socrates:: That there are two arithmetics and two mensurations, and many other Arts double in nature, though single in name.

Protarchus:: We will tell them so, and may the masters you speak of profit by the answer.

Socrates:: These, then, we affirm to be the most accurate Sciences.

Protarchus:: We do.

Socrates:: But we, Protarchus, shall be disavowed by the Dialectic Art if we set anything above her.

Protarchus:: And of what Art do you speak?

Socrates:: Every one will recognize the faculty I allude to. For the one that contemplates Being, and realities, and the immutable is allowed, I fancy, by all who have a grain of reason, to be the truest kind of cognition. But what is your decision, Protarchus?

Protarchus:: I often heard Gorgias say upon this topic, Socrates, that Oratory is very far superior to all other Arts, as it reduces all mankind to a voluntary servitude, and that it is by far the most excellent Art. But now I should not like to break with either of you.

Socrates:: Break a lance, you were going to say, I think, but humility restrained you, and made you desert your cause.

Protarchus:: As you like, Socrates.

Socrates:: Is it my fault that you misunderstand me?

Protarchus:: How?

Socrates:: I did not ask, my dear Protarchus, what Science or what Art is first in grandeur, excellence, or utility to man, but where most certainty and accuracy are to be found, however small the Art may be, and however slight its utility—that at present is the question; and consider, you will not offend Gorgias if his Art is allowed a pre-eminence in utility; and as to the other, we allowed that a mass of pure white, however small, surpasses in point of truth an impure mass, however great; so let us carefully examine and compare them without regard to utility or honour, and if there is any element in the soul with an inborn love of truth and an entire devotion to it, has this, let us inquire and determine, has this in all probability the purest Reason and Wisdom, or does a more rightful pretender to these attributes remain to be discovered?

Protarchus:: Well, I have reflected, and it can hardly, I think, be conceded that any Science or Art holds truth with a more tenacious grasp than this.

Socrates:: Is your reason for saying so the fact that the common Arts and their cultivators reason from opinions, and bend all their efforts to influence opinions? Or if nature is the subject of inquiry, is it not this sensible world, its origin, affections, and forces, that are investigated?

Protarchus:: It is.

Socrates:: Not eternal Being, therefore, but transient Becoming, present, future, or past, is the subject of study.

Protarchus:: True.

Socrates:: Can any of these objects, which never were, nor are, nor ever will be permanent, have the certainty of the most perfect truth?

Protarchus:: How can they?

Socrates:: Can things devoid of stability be the subject of anything else that is stable?

Protarchus:: I imagine not.

Socrates:: They are not the objects therefore of Reason or of Science possessing the highest truth.

Protarchus:: So it seems.

Socrates:: Protarchus, then, and Socrates, and Gorgias, and Philebus must be banished from our thoughts, and this testimony must be borne in aid of the inquiry:—

Protarchus:: What?

Socrates:: That either those things are the subject of stable, and pure, and true cognition, the immutable and unmixed I mean, or secondly, whatever has most affinity to them.

Protarchus:: True.

Socrates:: Of the names expressing cognition should not the most beautiful be assigned to the most beautiful objects?

Protarchus:: It is but reasonable.

Socrates:: Are not Reason and Wisdom the most illustrious names?

Protarchus:: They are.

Socrates:: These names, then, may be given to the Science of real Being with a superlatively just application.

Protarchus:: They may.

Socrates:: Well, these are precisely the names that I advocated in the coming comparison.

Protarchus:: They are, Socrates.

Socrates:: Well, with Wisdom and Pleasure ready to be mixed, to say that we resemble artists with the ingredients or materials of some artistic work ready to our hands, would be a just comparison.

Protarchus:: It would.

Socrates:: The next thing is to try to mix them.

Protarchus:: It is.

Socrates:: Well, by way of prelude had we not better refresh our memory?

Protarchus:: Of what?

Socrates:: Of that which we have already once recalled to mind, for it is an approved proverb that good words deserve repeating twice and thrice.

Protarchus:: True.

Socrates:: Well then, by Jove, this is what we said, I think:—

Protarchus:: What?

Socrates:: Philebus says Pleasure is the right aim of all that lives, and ought always to be proposed as an end, and is indeed the chief Good of the universe; and the two names Good and Pleasant only express one reality. Socrates, on the other hand, says, that they are not one but two like their names, and that Good and Pleasant are different in nature; and, secondly, that deeper participation in the nature of Good is to be ascribed to Wisdom than to Pleasure. Is not, or was not, this what we said, Protarchus?

Protarchus:: It was.

Socrates:: Well, was not and is not this a point agreed upon?

Protarchus:: What?

Socrates:: That the Good is distinguished from other things by this character:—

Protarchus:: What character?

Socrates:: That whatever has it constantly, completely, and thoroughly, never needs anything else, but has what is perfectly Sufficient. Is it not so?

Protarchus:: It is so.

Socrates:: Well, we attempted an ideal decomposition, did we not, confining them to separate lives, excluding Wisdom from Pleasure, and removing every iota of Pleasure from Wisdom?

Protarchus:: We did so.

Socrates:: Well, did we think either of them alone commensurate to human desire?

Protarchus:: Certainly not.

Socrates:: And if we were mistaken let any one stop us and set us right, Memory, Wisdom, Science, and True Opinion being assumed to belong to one class, and the question being, whether the absence of these would not mar the possession or acquisition of anything else however excellent; and a fortiori of Pleasure, however abundant or intense, if a man neither thought he was pleased, nor knew what sensation he experienced, nor remembered it a moment afterwards; and so of Wisdom. Whether, in fact, the total absence of Pleasure lends greater attractions to Wisdom than its presence, and whether Pleasures unattended with Wisdom are more Desirable than Pleasures attended with a grain of Wisdom.

Protarchus:: It cannot be so, Socrates; and this question needs no reiteration.

Socrates:: Perfect, then, and universally Desirable, and absolutely Good, are epithets that belong to neither of them.

Protarchus:: How can they?

Socrates:: Well; the Highest Good must now be more or less accurately determined, in order, as we said, that the second rank may be duly allotted.

Protarchus:: It must.

Socrates:: Well, a road leading to the Good has been discovered, has it not?

Protarchus:: What road?

Socrates:: Supposing a man had to be found—if the house where he dwelt were ascertained, would it not be a great step towards finding him?

Protarchus:: It would.

Socrates:: Now in the present case reason bids us, and for the second time, not to look in the Unmixed life for the Good, hut in the Mixed.

Protarchus:: True.

Socrates:: Well; the chance is greater that a beautifully mixed life will disclose what we are looking for, than that any other will.

Protarchus:: It is.

Socrates:: The gods, Protarchus, should be supplicated before we mix, either Dionysus or Hephaestus, or whoever is the tutelary lord of mixture.

Protarchus:: Right.

Socrates:: Well, we are like cupbearers standing before two fountains: one of honey, we might call that of Pleasure; and that of Wisdom, a sober and untempered fountain of austere and salubrious water. Of these we must make the most beautiful possible mixture.

Protarchus:: We must.

Socrates:: First advise me, if every kind of Pleasure and Wisdom were to be mixed together, would at beautiful mixture be most likely the result?

Protarchus:: Possibly.

Socrates:: But it would be dangerous; and there is a safer way of mixing, I think, that a certain principle indicates.

Protarchus:: What principle?

Socrates:: Pleasures differ in truth, we found, and Arts in accuracy.

Protarchus:: They do.

Socrates:: And Science differs from Science, one having for its objects things that come into being and perish, another what neither comes into being nor perishes, but exists ever the same and unchanging.

Inspecting these in reference to truth, we thought the latter the truer of the two. Suppose the truest divisions of each were first tried in combination, to see whether they are sufficient when mixed, and whether an absolutely satisfactory life is the result, or whether we must add some of the other divisions.

Protarchus:: We had better do so, I think.

Socrates:: Suppose a man is Wise about the essence of very justice, and gifted with Ratiocination worthy of his intuitions, and in all other matters endowed with a similar amount of comprehension.

Protarchus:: Supposed.

Socrates:: Will such a man have sufficient Knowledge, if the only circle and sphere he knows are the divine, the human sphere and sublunary circles escaping his ken, and his command as an architect over the other measures being as limited as his command over the circles?

Protarchus:: It is an absurd state that you describe, Socrates, this unacquaintance with any but the divine Sciences.

Socrates:: What? Ought the Arts dealing with the false circle and rule, with all their instability and impurity, to be thrown in together and added to the mixture?

Protarchus:: They must, if we are to be able when we go out of doors to find our way home.

Socrates:: Must music, too, in which we said a little while ago guessing and imitation are rife, and purity deficient?

Protarchus:: It must, I think, if our life is to be anything like a life.

Socrates:: Shall I, then, like a doorkeeper, hustled, pushed, and overborne, yield to the pressure, throw open the gates, and let all the Sciences stream in pell-mell, whether pure or alloyed?

Protarchus:: I cannot see the harm to a man, Socrates, of having all when he has the first.

Socrates:: Shall I let them all flow into the very Homeric and poetical meeting-waters' pool?

Protarchus:: Do so.

Socrates:: In they all have gone; and now for Pleasure's fountain. For our plan of first mixing the true sorts failed of execution, as from our indiscriminate love of Knowledge all its branches were admitted together before the Pleasures.

Protarchus:: True.

Socrates:: It is now time to decide about the Pleasures, whether they, too, should be admitted indiscriminately or whether the truest should be admitted first.

Protarchus:: It would be much safer if at first only the true kinds were admitted.

Socrates:: They have been admitted then, suppose. What next? If there are any others that are necessary, must we not admit them as we did the Sciences?

Protarchus:: Of course the necessary ones.

Socrates:: And, as the Arts without exception were agreed to be innocuous and advantageous, if we think the same about the Pleasures, namely, that all Enjoyments indiscriminately are always innocent and expedient, they must all be mixed.

Protarchus:: How shall we decide, and what course shall we take?

Socrates:: It is not to us that the question should be addressed, Protarchus, but to the Pleasures and Wisdoms themselves; and we should interrogate them thus.

Protarchus:: How?

Socrates:: Friends, whether Pleasures or whatsoever else is your proper title, would ye prefer to dwell with Wisdom of every kind, or without Wisdom? I imagine this is what they would infallibly reply:—

Protarchus:: What?

Socrates:: Why, as we said, that the lonely, and solitary, and unalloyed existence of any class is neither possible nor expedient: but of all classes taken individually we deem that the best one to live with is the tribe of Knowledge, particularly as it includes the perfect appreciation of ourselves.

Protarchus:: Ye have said well, we will reply.

Socrates:: Right. Next Wisdom and Reason must be interrogated. Are Pleasures required in the mixture? we would say to Reason and Wisdom. 'Pleasures indeed!' they might answer, 'what Pleasures?'

Protarchus:: Perhaps they might.

Socrates:: And we then should have to say this, 'Over and above the true Pleasures, do ye need the greatest and intensest Pleasures as companions?' 'How can we need them, Socrates,' they might answer, 'impeding us as they do, in ten thousand ways, seeing that by their agency the souls where we dwell are disturbed by mad desires, our very births are prevented, and any children that may be born to us perish of neglect and forgetfulness? But the true and pure Pleasures that you mention may be claimed as our own, you must know. Those, too, by which Health and Temperance are attended, and which each particular Virtue, like a goddess, has in her train to follow her whithersoever she goes, may be included in the mixture. But those that Folly and the other Vices have for companions cannot, without the highest absurdity, be associated with Reason, if your object is to examine the most beautiful and undiscordant mixture, in order to discover in it what to man and to the universe is the Highest Good, and what character it discloses to human divination.' A wise and characteristic answer of Reason this would be, would it not, for himself, and Memory, and True Opinion?

Protarchus:: It would.

Socrates:: And another thing is indispensable, and the condition of every natural creation.

Protarchus:: What?

Socrates:: Without an admixture of truth nothing can truly be created or exist.

Protarchus:: How can it?

Socrates:: Impossible. Now whether any further admixture is wanted, do you say, Protarchus and Philebus? My own opinion is, that an ordering law, unembodied, but fit to rule an embodied soul, has been perfectly traced in this delineation.

Protarchus:: And my opinion, Socrates, is the same.

Socrates:: To affirm, then, that the Good has its vestibule and palace on the spot where we stand would not be wrong.

Protarchus:: It would not.

Socrates:: Tell me what element in the mixture is most transcendently excellent, and the principal cause of the universal love of such a state of mind; and after considering this, we next will inquire whether Pleasure or Reason is the more similar and the more nearly related to this indwelling element.

Protarchus:: Right; for so our comparison will be much facilitated.

Socrates:: Well now, the cause is clear why any mixture is of the highest value, or absolutely worthless.

Protarchus:: What cause do you mean?

Socrates:: Surely, no one but knows this.

Protarchus:: What?

Socrates:: That if Measure and Symmetry are absent from any composition in any degree, ruin awaits both the ingredients and the composition. For it is no composition, but a discordant jumble of elements in deplorable disarray.

Protarchus:: True.

Socrates:: We have now tracked the Good to the covert of the Beautiful, for Measure and Symmetry are Beauty and Virtue all the world over, I imagine.

Protarchus:: They are.

Socrates:: And Truth, we said, is associated with them.

Protarchus:: We did.

Socrates:: Well, then, if there is no single form in which we can enclose the good, let us enclose it in three—Beauty, Symmetry, and Truth, and agree that these are the truest cause of the properties of the mixture, and being Good are the reason of its goodness.

Protarchus:: They are.

Socrates:: By this time, Protarchus, any one is competent to judge whether Pleasure or Wisdom is more akin to the Supreme Good, and more worthy of homage from men and gods.

Protarchus:: It is clear, indeed; but still the argument had better be completed.

Socrates:: Each of the characters must be separately compared with Pleasure and Wisdom, for we must determine to which of the two they each have a greater affinity.

Protarchus:: Beauty, Truth, and Pleasure, do you mean?

Socrates:: Yes; and first take Truth, Protarchus, and fix your eyes on the three things, Reason, Truth, and Pleasure, and, after taking a long time to think, answer yourself whether Pleasure or Reason has more affinity to Truth.

Protarchus:: What need of taking time? Surely there is no comparison. Pleasure, of all things, is most prone to false exaggeration, and they say that in the Pleasures of love, the greatest as is reckoned, even perjury is winked at by the gods from the childlike irrationality of Pleasure; whereas Reason, if not the same thing as Truth, is of all things the likest and the truest.

Socrates:: Well, does Measure, we must next examine, belong to Pleasure more than to Wisdom, or to Wisdom more than to Pleasure?

Protarchus:: It is, again, an easy problem that you propose, for I imagine that Pleasure and Enjoyment are, of all things in the world, the most void of Measure that can be found, and Reason and Science the most full of Measure.

Socrates:: Good; but tell me about the third character. Has Reason more of Beauty communicated to it or Pleasure; and is Reason fairer than Pleasure, or vice versa?

Protarchus:: Why, Wisdom and Reason, Socrates, were never in dreams or in waking thought unseemly, were they, to the eye or to imagination in any respect, degree, or time, past, present, or to come?

Socrates:: They never were.

Protarchus:: But Pleasures, and those, too, the greatest, when seen to be enjoyed, are ridiculous if not unseemly, and we ourselves are ashamed of them, and veil and hide them as much as we can, and shroud them in night as not fit for the eye of day.

Socrates:: You will proclaim, then, to all the world, by missionaries and in person, that Pleasure among possessions is neither best nor second. But first, is Measure, and the Measured, and the Due, and whatever things are like to these, and inhabit the eternal sphere; second, are the Symmetrical, and Beautiful, and Perfect, and Adequate, and all the individuals of this tribe.

Protarchus:: It seems so.

Socrates:: Third, if I divine aright, Reason and Wisdom may be ranked without much deviation from the truth.

Protarchus:: Apparently.

Socrates:: And does not the fourth place belong to the things of the mind we spoke of—Sciences, and Arts, and Right Opinions by name? Are not these, I say, next to the first three, as the Good is more nearly related to them than to Pleasure?

Protarchus:: I think so.

Socrates:: And, fifth, are the Pleasures we recognized and distinguished as painless, calling them pure and mental, some the companions of Science, others of Sensations.

Protarchus:: Apparently.

Socrates:: And the sixth generation, says Orpheus, shall close the procession of my song. Our investigation, too, seems to terminate when the sixth rank has been awarded. And nothing now remains but to place a head upon the dialogue.

Protarchus:: Let it be done.

Socrates:: Well, a third libation to the savior god, while we again bear witness to the doctrine.

Protarchus:: What doctrine?

Socrates:: Philebus said Pleasure is the Good, without exception and without defect.

Protarchus:: The third libation that you spoke of just now was apparently the repetition of the original thesis.

Socrates:: Yes; and now listen. Being convinced of what I have just established, and having a repugnance for the doctrine of Philebus, a doctrine, indeed, that ten thousand others share, I maintained that Reason was a much higher Good than Pleasure, and more salutary to human life.

Protarchus:: You did.

Socrates:: And, suspecting the same to be true of many other things, I said that if it should appear that any third thing was better than either, the second rank belonged to Reason rather than to Pleasure, as I was ready to prove.

Protarchus:: That is what you said.

Socrates:: And then we had sufficient evidence that both were insufficient.

Protarchus:: We had.

Socrates:: And in this investigation Reason as well as Pleasure fell decidedly short of being the Sovereign Good, failing, as they did, in Self-sufficiency, Adequacy, and Perfection.

Protarchus:: Undeniably.

Socrates:: And when a third thing proved to be more excellent than either, Reason, compared with Pleasure, appeared ten thousand times more allied and related to the victor.

Protarchus:: It did.

Socrates:: It is the fifth rank, according to the judgment that our dialectic has pronounced, that belongs to Pleasure.

Protarchus:: So it seems.

Socrates:: Not the first, though all oxen, and horses, and the whole brute creation, should proclaim so by their eagerness to gratify their lust, relying on whose testimony, as diviners on that of birds, the vulgar judge Pleasure most decisive of the goodness of life; as if brutes and their loves were more weighty witnesses than those whom a muse of philosophy has inspired with the divinations of reason.

Protarchus:: The truth of what you say, Socrates, approves itself now to all of us.

Socrates:: Am I released, then?

Protarchus:: There is a little that still remains, Socrates; for surely you will not be the first to weary of the subject, and I will remind you which part is unfinished.

# The Philebus.

Translated by Sydenham.

*PERSONS OF THE DIALOGUE.*

SOCRATES, PROTARCHUS, PHILEBUS.

SCENE.—The Lyceum.

Socrates:: Consider now, Protarchus, what the doctrine of Philebus is, which you are taking upon yourself to second and support; and what things said by me you are going to controvert, if they should be found such as are not agreeable to your mind. Will you permit me to state, in a summary way, the difference between my positions and those of Philebus?

Protarchus:: By all means.

Socrates:: Philebus then says, that the good of all animals is joy, and pleasure, and delight, and whatever else is congenial to them and harmonizes with all other things of the same kind. And what I contend for Is, that those things are not the best; but that to be wise, and to understand, and remember, and whatever is of kin to them right opinions, and true reasonings, are better things than pleasure, and more eligible to all beings universally, that is, to such as are capable of receiving the participation of them; and that to all beings which have that capacity, the actual partaking of them is of all things the most advantageous, not only to those beings which are, but to those also which are to come. Do we not, O Philebus, you and I, severally lay down some such hypotheses as these?

Philebus:: Exactly such, O Socrates!

Socrates:: And will you, Protarchus, take up the controversy, as I have just now stated it?

Protarchus:: Of necessity I must. For Philebus, the champion of our side, is tired and gives out.

Socrates:: Now it is right and proper for us to discover, by all means possible, the full force and meaning of both those hypotheses; and not to give over till we have determined the controversy between them.

Protarchus:: I agree with you, it is.

Socrates:: Let us agree in this too, besides.

Protarchus:: In what?

Socrates:: That we should, each of us, endeavor to set forth what state and what affection of the soul is able, according to our different hypotheses, to procure for every man a happy life. Is it not our business so to do?

Protarchus:: Certainly it is.

Socrates:: Well then: You say that it is that of rejoicing; we, that it is that of understanding and thinking rightly.

Protarchus:: True.

Socrates:: But what if there should appear some other, preferable to both of these, but more nearly of kin to pleasure? should we not in this case be both of us confuted, and obliged to yield the preference to a life which gives the stable possession of those very things wherein you place human happiness? However, at the same time it must be agreed, that a life of pleasure would be found more eligible than a life of knowledge or intellection.

Protarchus:: Without doubt.

Socrates:: But if that better state of the soul should appear to be more nearly, allied to knowledge, in that case, knowledge would be found to have the advantage over pleasure, and pleasure must give place. Do ye not agree with me, that these things are so? or how otherwise say ye that they are?

Protarchus:: To me, I must confess, they seem to be as you represent them.

Socrates:: But to Philebus how seem they? What say you, Philebus?

Philebus:: To me pleasure seems, and will always seem, to be the superior, whatever it be compared with. And you, Protarchus, will be at length convinced of it yourself.

Protarchus:: After having resigned to me the management of the debate, you can no longer be the master of what should be yielded to Socrates, and what should not.

Philebus:: You are in the right. But, however, I have discharged my duty; and I here call the Goddess herself to witness it.

Protarchus:: We too are witnesses of the same; and can testify your making of the assertion which you have just made. But now, as to that examination, O Socrates! which is to follow after what you and I have agreed in, whether Philebus be willing to consent, or however he may be disposed, let us try to go through with it, and bring it to a conclusion.

Socrates:: By all means, let us; beginning with that very Goddess who, according to him, is called Venus, but whose true name is Pleasure.

Protarchus:: Perfectly right.

Socrates:: The fear which I have always in me concerning the proper names of the Gods, is no ordinary kind of fear; but surpasses the greatest dread. Hence, in the present case, with regard to Venus, whatever name be agreeable to the Goddess, by that would I choose to call her. But as to pleasure, how various a thing it is, I well know. And with this, as I just now said, ought we to begin, by considering and inquiring into the nature of pleasure first. For we hear it called, indeed, by one single name, as if it were one simple thing: it assumes, however, all sorts of forms, even such as are the most unlike one to another. For observe: we say that the intemperate man has pleasure; and that the temperate man has pleasure also,—pleasure in being what he is, that is, temperate. Again: we say that pleasure attends on folly, and on the man who is full of foolish opinions and foolish hopes; that pleasure attends also on the man who thinks wisely,—pleasure in that very mental energy, his thinking wisely. Now any person who would affirm these pleasures to be of similar kind, would be justly deemed to want understanding.

Protarchus:: The pleasures which you mention, O Socrates, are indeed produced by contrary causes; but in the pleasures themselves there is no contrariety. For how should pleasure not be similar to pleasure, itself to itself, the most similar of all things?

Socrates:: Just so, color too, my friend, differs not from color in this respect, that it is color, all. And yet, we all of us know that black, besides being different from white, happens to be also its direct contrary. So figure, too, is all one with figure, after the same manner, in the general. But as to the parts of that one general thing, some are directly contrary to others; and between the rest there happens to be a kind of infinite diversity. And many other things we shall find to be of this nature. Believe not then this portion, that things the most contrary are all of them one. And I suspect that we shall also find some pleasures quite contrary to other pleasures.

Protarchus:: It may be so. But how will that hurt my side of the question?

Socrates:: In that you call them dissimilar as they are, by another name; (shall we say?) for all pleasant things you call good. Now that all pleasant things are pleasant, admits of no dispute. But though many of them are evil, and many indeed good, as I readily acknowledge, yet all of them you call good; and at the same time you confess them to be dissimilar in their natures, when a man forces you to this confession. What then is that, the same in every pleasure, in the evil pleasures equally with the good, from which you give to all pleasures the denomination of good?

Protarchus:: What is that, O Socrates, which you say? Do you imagine that any person, after having asserted that pleasure is the good, will admit your supposition? or will suffer it to pass uncontradicted, that only some pleasures are good, but that other pleasures are evil?

Socrates:: However, you will acknowledge that pleasures are unlike one to another, and some even contrary to others?

Protarchus:: By no means; so far as they are pleasures, every one of them.

Socrates:: We are now brought back again to the same position, O Protarchus! There is no difference between pleasure and pleasure; all pleasures are alike, we must say: and the similar instances, just now produced, in colors and in figures, have had, it seems, no effect, upon us. But we shall try, and talk after the manner of the meanest arguers, and mere novices in dialectic.

Protarchus:: How do you mean?

Socrates:: I mean, that if I, to imitate you, and dispute with you in your own way, should dare to assert that two things, the most unlike, are of all things the most like to each other, I should say nothing more than what you say: to that both of us would appear to be rawer disputants than we ought to be; and the subject of our dispute would thus flip out of our hands, and get away. Let us resume it, therefore, once more: and, perhaps, by returning to similitudes, we may be induced to make some concessions each of us to the other.

Protarchus:: Say how.

Socrates:: Suppose me to be the party questioned; and suppose yourself, Protarchus, to interrogate me.

Protarchus:: Concerning what?

Socrates:: Concerning prudence, and science, and intelligence, and all the rest of those things which in the beginning of our conversation I said were good, when I was asked what sort of a thing good was; must I not acknowledge these to be attended with the same circumstance which attends those other things celebrated by you?

Protarchus:: What circumstance?

Socrates:: The sciences, viewed all of them together, will seem to both of us not only many, and of diverse kinds, but dissimilar too, some to others. Now if besides there should appear a contrariety in any way, between some of them and others, should I deserve to be disputed with any longer, if, fearful of admitting contrariety between the sciences, I were to assert that no one science was dissimilar to any other science? For then the matter in debate between us, as if it were a mere fable, being destroyed, would vanish: while we saved ourselves by an illogical retreat. But such an event ought not to happen, except this part of it,—the saving of ourselves. And now the equality, which appears thus far between your hypothesis and mine, I am well enough pleased with. The pleasures happen to be found many and dissimilar; many also and diverse are the sciences. The difference, however, between your good and mine, O Protarchus, let us not conceal: but let us dare to say it fairly and openly before us both; that we may discover, (if those who are closely examined will make any discovery,) whether pleasure or wisdom ought to be pronounced the chief good of man, or whether any third thing, different from either: since it is not, as I presume, with this view that we contend, that my hypothesis, or that yours, may prevail over its antagonist; but that which hath the truth on its side, we are both of us to contend for and support.

Protarchus:: This is certainly our duty.

Socrates:: But this point further we should, both of us together, settle on the surest ground.

Protarchus:: What point do you mean?

Socrates:: That which puzzles and perplexes all persons who choose to make it the subject of their conversation: nay, sometimes some others, who have no such intention, are led to it unawares in conversation upon other subjects.

Protarchus:: Express what you mean in plainer terms.

Socrates:: I mean that which fell in our way but just now, the nature of which is so full of wonders. For that many are one, and that one is many, is wonderful to have it said; and either of those positions is easy to be controverted.

Protarchus:: Do you mean such positions as this,—that I Protarchus, who am by nature one person, am also many? and such as these others,—that myself, and other persons the reverse of me,—the great also and the little, the heavy and the light, are one and the same? with a thousand positions more which might be made of like kind?

Socrates:: The wonders, O Protarchus, which you have now spoken of, relating to the one and many, have been hackneyed in the mouths of the vulgar; but by the common agreement, as it were, of all men, they are now said aside, and are never to be mentioned: for they are considered as childish and easy objections, and great impediments also to discourse. It is now also agreed, never to introduce into conversation, as an instance of one and many, the members or parts into which any single thing may be considered as divisible. Because, when a respondent has once admitted and avowed, that all these [members or parts] are that one thing, which is thus at the same time many, he is refuted and laughed at by his questioner, for having been driven to assert such monstrous absurdities as these,—that a single one is an infinite multitude, and an infinite multitude only one.

Protarchus:: What other things, then, not hackneyed among the vulgar, nor as yet universally agreed on, do you mean, O Socrates, relating to this point?

Socrates:: I mean, young man, when a thing is proposed to be considered, which is one, but is not of the number or nature of things generated and perishable. For as to the ones of this latter sort, it is agreed, as I just now said, to reject them as unworthy of a serious confutation. The ones which I mean are such as man, or, beauty, good. When these *henads*, or such as these, are proposed for subjects of debate, much serious attention is given them; and when they come to be divided, any one of them into many, much doubt and controversy arises.

Protarchus:: Upon what points?

Socrates:: In the first place, whether such monads should be deemed to have true being. In the next place, how it is that these monads, every one of them being always the same, and never generated, nor ever to be destroyed, have, notwithstanding, one and the same stability common to them all. And lastly, Whether we should suppose every such monad to be dispersed and spread abroad amongst an infinity of things generated or produced, and thus, from being one, to become many; or whether we should suppose it to remain entire, itself by itself, separate and apart from that multitude. But, of all suppositions, this might appear the most impossible, that one and the same thing should be in a single one, and in many, at the same time. These points, O Protarchus, which regard such instances as I have mentioned, and not such as were mentioned by you, these are they, which, for want of being rightly settled, create all the difficulties and doubts we meet with in discourse; but when once they are settled rightly, they clear the way with ease.

Protarchus:: Then, it seems, we are to labor these points first.

Socrates:: I should think we ought.

Protarchus:: And that we consent to it, you may take for granted, all of us here. Philebus, indeed, it is best perhaps, at present, not to discompose by asking him questions, now that he is quiet.

Socrates:: Very well; but in what way shall we begin the discussion of these points in so wide a field of controversy? Shall we begin thus?

Protarchus:: How?

Socrates:: We say, in speaking of these monads, (each of which is one, but, on a logical examination of it, appears to be divisible into many,) that they run throughout every sentence in our discourse, every where and always; and that, as their being shall never have an end, so neither does it first begin in the present age. Now this perpetual attendant upon all speech proceeds, as it seems to me, from something immortal and undecaying within ourselves. And hence it is, that the youth every where, when they have thus had a taste of it, are overjoyed at their having thus found a treasure of wisdom. Transported, therefore, with the delight it gives them they apply it to every subject of discourse: sometimes they collect particulars from all quarters, and roll them into one; then they unroll them again, and part them asunder. After having in this way puzzled themselves in the first place, they question and puzzle the person next at hand, whether he be their equal in age, or younger than themselves, or older, sparing neither father nor mother, nor any one else who will attend to them scarcely other animals more than man: it is certain they would not exempt any who speak a foreign language only, could they but find somewhere an interpreter.

Protarchus:: Do you not see, O Socrates, how numerous we are, and that all of us are young? and are you not afraid that, if you rail at us, we shall all join Philebus, and attack you jointly? However (for we apprehend your meaning), if you can by any means or contrivance easily rid of us of these perplexities, which hinder the progress of our inquiry, and can devise some better way of managing the argument, do you but give your mind to the prosecution of it, and we shall do our utmost to follow and attend you. For the present debate is of no trifling concern, Socrates.

Socrates:: Indeed it is not, O boys! as Philebus called you. No better way then is there, nor can there be, than that, which I am always a great lover of; but often before now it has slipped away from my sight, and has left me, as it were, in a desert, at a loss whither to turn me.

Protarchus:: Let us but know what way you mean.

Socrates:: To point out the way is not very difficult; but to travel in it, is the most difficult of all things. For all such human inventions as depend on art are, in this way, discovered and said open. Consider then the way which, I am speaking of.

Protarchus:: Do but tell it us then.

Socrates:: A gift of the Gods to men, as it appears to me, by a certain Prometheus hurled from the Gods along with a fire the most luminous. From the men of ancient times, men better than we are, and dwelling nigher to the Gods, this tradition of it hath descended to us,—that those beings said to be for ever derive their essence from one and many; and therefore have in themselves bound and infinity connatural to them: that, being in the midst of things so constituted as they are, we ought to suppose and to search for some one idea in every thing around us; for that, since it is there, we shall, on searching, be sure to find it: that, after we have found it, we are next to look for two, if two only are next; otherwise three, or some other number: again, that every one of this number we are to examine in like manner: until at length a man not only perceives, that the one, with which he began, is one, and many, and infinite, but discovers also how many it contains: for, that a man never should proceed to the idea of infinite, and apply it immediately to any number, before he has fully discovered all the definite number which lies between the infinite and the one: but that, having completed this discovery, we should then finish our search; and dismissing into infinity every one of all those numbers, we should bid farewell to them. The Gods, as I before said, have given us to consider things in this way, and in this way to learn them and teach them one to another. But the wise men of these days take any monad whatever, and divide it into many with more conciseness than they ought, and with more prolixity too, since they never come to an end: for immediately after the monad they introduce infinity, overlooking all the intermediate numbers; the express mention of which, or the omission of them distinguishes such dialectical and fair debates as ours, from such as are contentious and sophistical.

Protarchus:: Part of what you say, Socrates, I seem to apprehend tolerably well: but the meaning of some things which you have now said, I should be glad to hear you express in plainer terms.

Socrates:: The whole of what I have said, Protarchus, is evident in letters. In these, therefore, which have been taught you from your childhood, you may easily apprehend my meaning.

Protarchus:: How in letters?

Socrates:: Voice, that issues out of the human mouth, may be considered as one general thing, admitting of an infinite number of articulations, not only in all men taken together, but also in every individual man.

Protarchus:: Without doubt.

Socrates:: Now we are not made knowing in speech, or sound articulate, through the knowledge either of the infinity or of the oneness of its nature: but to know how many, and what, are the parts into which it is naturally divided,—this it is which makes any of us a grammarian, or skilled in grammar.

Protarchus:: Most certainly.

Socrates:: And further, that by which a man comes to be skilled in music is this very thing.

Protarchus:: How so?

Socrates:: Musical sound, which is the subject matter of this art, may be considered in itself as one general thing.

Protarchus:: Without dispute.

Socrates:: And let us suppose two kinds of it, the grave and the acute, and a third kind between those two, the homotonous, or how otherwise?

Protarchus:: Musical sound in general is so to be distinguished.

Socrates:: But with the knowledge of this distinction only, you would not yet be skilled in music; though without knowing it you would be, as to music, quite worthless.

Protarchus:: Undoubtedly.

Socrates:: But, my friend, when you have learnt the intervals between all musical sounds, from the more acute to the more grave, how many they are in number, and into what sorts they are distinguished; when you have also learnt the bounds of these intervals, and how many systems are composed out of them; (which our predecessors having discovered, delivered down to us, who come after them by the name of harmonies; and having discovered other such affections in the motions of the body, and in words, measuring these by numbers, they have taught us to call them rhythms and meters; bidding us to infer from hence, that every one and many ought to be searched into and examined in the same way;) when you have learnt all those things, and comprehend them in this ample manner, with all their several diversities and distinctions, then are you become skilled in music. And by considering in the same way the nature of any other kind of being, when you thus fully comprehend it, you are become in that respect intelligent and wise. But the infinite multitude of individuals, their infinite variety, and the infinite changes incident to each, keep you infinitely far off from intelligence and wisdom: and as they make you to be behind other men in every path of knowledge, they make you inconsiderable, and of no account, not to be numbered amongst the knowing in any subject; because you never consider any thing thoroughly, and are unable to give a true account of it, never looking at the definite number which it contains.

Protarchus:: Excellently well, O Philebus, as it appears to me, has Socrates spoken in what he has now said.

Philebus:: It appears so too to me myself. But how does all this speech of his concern our controversy? What was the design or drift of it?

Socrates:: A very pertinent question, O Protarchus, this, proposed to us by Philebus.

Protarchus:: Indeed it is: and by all means give it an answer.

Socrates:: That will I do, as soon as I have gone through the little yet remaining of the subject on which I have been speaking. For, as the man who applies himself to the consideration of any kind of things whatever ought not, as I have said, to throw his eye at once upon the infinite, but upon some definite number in the first place; so, on the other hand, when a man is obliged to set out from the infinite, he ought not to mount up immediately to the one, but to some certain number, in each of whose ones a certain multitude is contained; and thus gradually rising from a greater to a less number, to end in one. As an instance of what I have now said, let us resume the consideration of letters.

Protarchus:: In what way?

Socrates:: Whoever it was, whether some God, or some divine man, (the Egyptian reports say that his name was Theuth,) who first contemplated the infinite nature of the human voice, he observed, that amongst the infinity of the sounds it uttered the vowel sounds were more than one, they were many. Again, other utterances he observed, which were not indeed, vowels, but partook, however, of some kind of vocal sound; and that of these also there was a certain number. A third sort of letters also he set apart, those which are now called mutes by us. After this he distinguished every one of these letters which are without any vocal sound, whether perfect or imperfect: the vowels also, and those of middle sort, every one of them he distinguished in the same manner: and when he had discovered how many letters there were of each sort, to every one, and to all of them together, he gave the name of element. But perceiving that none of us could understand any one of them by itself alone, without learning them all, he considered that this connection, or common bond between them was one; and that all these letters made in a manner but one thing: and as he perceived that there was one art in all these, he called it, from its subject matter, the art of letters.

Philebus:: This which Socrates now says, O Protarchus, I understand still more plainly than what he said just before; and am at no loss to apprehend what relation each of the subjects about which he has spoken has to the other. But as to that article in which his argument on the first of those subjects appeared to me to be defective, I am at a loss still.

Socrates:: To know what those instances are to the purpose; is not this your meaning?

Philebus:: Just so. This very thing it is that Protarchus and myself are all this while in search of.

Socrates:: In search still, do you say, when you are just now arrived at it?

Philebus:: How so?

Socrates:: Was not the point originally in dispute between us this: Whether wisdom or pleasure was the more eligible?

Philebus:: Certainly it was.

Socrates:: And do we not admit that each of them is one thing?

Philebus:: Without doubt.

Socrates:: Now then must come this question, arising naturally from what was said a little before the mention of music and grammar,—In what way (or by what division) are wisdom and pleasure, each of them one and many? or how is it, that neither of them breaks into infinite multitude directly; but that each contains some certain number before it pass into infinity?

Protarchus:: Upon no trivial question, O Philebus, on a sudden has Socrates, after having led us a large roundabout way, I know not how, thrown us. And now consider, which of us two shall answer to the question he has proposed. It would be ridiculous in me, who have undertaken the support of your argument, to make an absolute revolt on account of my disability in regard to the present question; and so to remit over again to you the talk of giving an answer to it: but I think it would be much more ridiculous for both of us to fail. Consider, then, what we shall do in this case, where Socrates seems to interrogate us concerning the species of pleasure;—whether it is divisible into different species, or not; and, if it be, what is the number of these species, and how they differ in their nature: and the like questions he seems to put to us concerning knowledge and intelligence.

Socrates:: Your conjecture is perfectly right, O son of Callias! and, if we are not able to answer to these questions upon every monad, as to its likeness, sameness, and contrariety,—unless, I say, we can do this,—the instances just now produced have shown, that none of us, in any matter we had to handle, would ever be of any worth at all.

Protarchus:: The case, O Socrates, seems indeed to be not very different from your representation of it. Well, it is certainly a fine thing to know all things, for a wise and prudent person: but I think the best thing, next to that is for a man not to be ignorant of himself. With what design I have now said this, I shall proceed to tell you. This conversation, O Socrates, you have granted to us all, and have given yourself up to us, for the purpose of investigating what is the best of human goods. For, when Philebus had said that it consisted in pleasure, and delight, and joy, and all things of the like nature, you opposed him on this point, and said, it consisted not in these things, but in those which we often repeat the mention of; and we are right in so doing, that the opinions on each side, being always fresh in our memories, may the more easily be examined. You then, it seems, say, what I shall be right in again repeating, that intellect, science, art, and whatever is allied to them are better things than Pleasure with her allies; and therefore, that the possession, not of these, but of those greater goods, ought to be the object of our aim. Now these positions being said down severally on each side, as subject-matters of our debate, we in a jocose way threatened, that we would not suffer you to go home quietly before it was brought to a fair determination. You complied, and promised us to contribute all you could towards the accomplishment of that end. We insist therefore that, as children say, you must not take away again what is fairly given. But, in the present inquiry, forbear proceeding in your usual way.

Socrates:: What way do you mean?

Protarchus:: Bringing us into straits and embarrassments; propounding questions to which we should not be able on the sudden to give a proper answer. For we are not to imagine that our present inquiry is brought to a conclusion, merely because all of us are at a loss what to answer. If, therefore, we are unable to extricate ourselves from these difficulties, you must help us out; for so you promised. Consider, then, what to do on this occasion; whether to distinguish pleasure and knowledge, each of them into their proper species; or whether to pass it by, if you choose to take a different way, and can find some other means of deciding the matter now controverted between us.

Socrates:: No harm then need I be afraid of any longer to myself, since you have said this. For your leaving to my own choice what ways and means to make use of, frees me from all apprehensions on my own private account. But, to make it still easier to me, some God, I think, has brought things to my remembrance.

Protarchus:: How do you mean? What things?

Socrates:: Having formerly heard, either in a dream, or broad awake, certain sayings, I have them now again present to my mind;—sayings concerning pleasure and knowledge, that neither of them is of itself good, but some third thing, different from both of those, and better than either. Now if this should discover itself to us clearly, pleasure is then to be dismissed from any pretensions to the victory. For we should then no longer expect to find that pleasure and good are the same thing: or how say you?

Protarchus:: Just so.

Socrates:: We shall have no occasion then, in my opinion, for distinguishing the several species of pleasure. And in the progress of our inquiry it will appear more evidently still that I am in the right.

Protarchus:: Having begun so happily, proceed, and finish with the same success.

Socrates:: Let us, first, agree upon a few little points beside.

Protarchus:: What are those?

Socrates:: In what condition or state of being is the good? Must it of necessity be perfect? or may it want perfection?

Protarchus:: Of all things, O Socrates, it is the most perfect.

Socrates:: Well; and is it also sufficient?

Protarchus:: Without doubt: and in this respect it excels all other things.

Socrates:: But further: This also, I presume, is of all things the most necessary to say of it, that every being to whom it is known, hunts after, and desires it, as choosing the possession of it above all things; and, indeed, caring for no other things, except such as are constantly attended with the enjoyment of good.

Protarchus:: There is no possibility of contradicting this.

Socrates:: Now, then, let us consider and judge of the life of pleasure and the life of knowledge: and to do this the better, let us view them each apart from the other.

Protarchus:: How do you mean?

Socrates:: Thus: Let us suppose a life of pleasure, unaccompanied by intelligence; and, on the other hand, a life of intelligence, unaccompanied by pleasure. For, if either of them be good, it must be complete and sufficient, in want of no aid from any other quarter. But, if either of them should appear to be indigent of aught, or insufficient, we are no longer to imagine this to be that real and true good we are in search of.

Protarchus:: In such a case, how could we?

Socrates:: Shall we then examine their pretensions thus separately, making your own mind the judge?

Protarchus:: With all my heart.

Socrates:: Answer then to my questions.

Protarchus:: Propose them.

Socrates:: Would you, Protarchus, accept the offer, were it made you, to live all your life with a sense and feeling of pleasures the most exquisite?

Protarchus:: Undoubtedly. Why not?

Socrates:: Suppose you were in full possession of this, would you not think that something beside was still wanting to you?

Protarchus:: I certainly should not.

Socrates:: Consider now, whether you would not be in want of wisdom, and intelligence, and reasoning, and such other things as are the sisters of these; at least whether you would not want to see something.

Protarchus:: Why should I, when I had in a manner all things, in having continual joy?

Socrates:: Living thus then continually all your life, would the most exquisite pleasures give you any joy?

Protarchus:: Why not?

Socrates:: Having neither intellect, nor memory, nor science, nor opinion,—in the first place of this very thing, your possession of joy, you must of necessity be ignorant, and unable to say whether you then had any joy, or not, being void of all just discernment or knowledge of things present.

Protarchus:: I must.

Socrates:: Being also void of memory, it would be impossible for you to remember that you ever had any joy; or to preserve even the least memorial of a joy then present: wanting also right opinion, you could not so much as think you had any joy, though in the midst of it: unable also to reason or draw consequences, you could not possibly conclude that ever you should have any joy to come. Thus you would live the life, not of a man, but of a sea-sponge, or of an oyster Are these things so? or ought we to think otherwise concerning them?

Protarchus:: A life of mere pleasure must be such as you have described it.

Socrates:: Do we think, then, that such a life is eligible?

Protarchus:: The description of it, O Socrates, has silenced me entirely for the present.

Socrates:: Nay; let us not shrink so soon from pursuing our inquiries; but proceed to the consideration of that other life, the life of intellect.

Protarchus:: What kind of life is that?

Socrates:: Let us consider, whether any of us would choose to live with wisdom, and intellect, and science, and a perfect memory of all things; but without partaking of pleasure, whether great or small; and, on the other hand, without partaking of pain; wholly exempt from all feelings of either kind.

Protarchus:: To me, O Socrates, neither of these lives appears eligible; and I think never would appear so to any other man.

Socrates:: What think you of a middle life, where both of them are mixed together—a life composed of the other two?

Protarchus:: Composed of pleasure do you mean, on the one hand, and of intellect and wisdom on the other hand?

Socrates:: Just so: such a life do I mean.

Protarchus:: Every man would certainly prefer such a kind of life to either of the other two.

Socrates:: Perceive we now what the result is of our discoursing thus far on the subject now before us?

Protarchus:: Perfectly well; it is this: that three lives have been proposed for our consideration, and that neither of the two first-mentioned appears sufficient or eligible for any one, neither for man, nor any other animal.

Socrates:: Is it not evident, then, with regard to the point in controversy, that neither of those two lives can give the possession of the good? for, whichever of them had such a power, that life would be sufficient, perfect, and eligible also to all those animals who are capable of living in the continual enjoyment of the good all their lives. And whoever of us should give any other life the preference to that, would make his election contrary to the nature of the truly eligible, though not willingly, because through ignorance, or some unhappy necessity.

Protarchus:: What you say is highly probable indeed.

Socrates:: That we ought not to think that Goddess of Philebus to be the same thing with the good, has been shown, I think, sufficiently.

Philebus:: Neither is that intellect of yours, O Socrates, the good; for it will be found deficient in the same respects.

Socrates:: Mine perhaps, O Philebus, may; but not that intellect which is divine and true; for it is otherwise, I presume, with this. However, I do not contend for the chief prize of victory, in behalf of the life of intellect against the middle or mixed life. But what to do with the second prize, and which life to bestow it on, is next to be considered. For the cause of that happiness which the mixed life affords, one of us, perhaps, may ascribe to intellect, the other of us to pleasure. And thus, neither of these two would be man’s sovereign good, and yet one or other of them may perhaps be supposed the cause of it. Now on this point I would still more earnestly contend against Philebus,—that not pleasure, but intellect, is the nearest allied, and the most similar to that, whatever it be, by the possession of which the mixed life becomes eligible and good. And if this account be true, pleasure can never be said to have any just pretentions either to the first or to the second prize of excellence. Still further is she from coming in for the third prize, if any credit may be given for the present to that intellect of mine.

Protarchus:: Indeed, O Socrates, it seems to me that Pleasure is now fallen: your reasons have been like so many blows given her; under the force of which, fighting for the master-prize, she lies vanquished. But I think, however, that we must say it was prudent in Intellect, not to contend for that prize; for she would otherwise have met with the same fate. Now if Pleasure should also lose the prize of second value, as already she has lost the highest, she must entirely fall into disgrace with her own lovers: for even to them she would no longer appear to merit such honour as they paid to her before.

Socrates:: Well then; is it not the better way to dismiss her now directly, and not give her pain, by inspecting into her too nicely, and discovering all her imperfections?

Protarchus:: What you now say goes for nothing, Socrates.

Socrates:: Do you mean, because I supposed an impossible thing when I supposed that pain might be given to pleasure?

Protarchus:: Not on that account only, but because you are sensible that none of us will give you a discharge before you have brought these arguments to a conclusion.

Socrates:: Ah! the copious matter of argument, O Protarchus, still behind! and scarcely is any part of it very manageable on the present occasion. For, whoever stands forth as the champion of Intellect to win the second prize for her, must, as it appears to me, take another way of combating, and has need of other weapons different from those reasons I before made use of: some, however, of the same may, perhaps, be of use again. Must we then, proceed in that manner?

Protarchus:: By all means.

Socrates:: But let us begin cautiously, and endeavor to lay down right principles.

Protarchus:: What principles do you mean?

Socrates:: All things which are now in the universe let us divide into two sorts, or rather, if you please, into three.

Protarchus:: You should tell us what difference between things it is, with respect to which you make that division.

Socrates:: Some things which have been already mentioned let us reassume.

Protarchus:: What things?

Socrates:: God, we said, has exhibited the infinite, and also the bound of beings.

Protarchus:: Very true.

Socrates:: Let us take these for two of the species of things; and for a third let us take that, which is composed of those two mixed together. But I deserve, methinks, to be laughed at for pretending thus to distinguish things, and to enumerate their several species.

Protarchus:: Why so, my good friend?

Socrates:: A fourth kind appears to have been omitted by me.

Protarchus:: Say, What?

Socrates:: Of that commixture, the combination of the former two, consider the cause: and beside those three species, set me down this cause for a fourth.

Protarchus:: Will you not want a fifth species too, for a cause of disunion and separation?

Socrates:: Perhaps I may; but not, I believe, at present. However, should there be occasion For it, you will pardon me, if I go in pursuit of a fifth life.

Protarchus:: Certainly.

Socrates:: Of these four species, then, in the first place dividing the three, and perceiving that two of these, when both are divided, and their divisions separated, are, each of them many;—then, gathering together the many of each, and uniting them again, let us endeavor to understand in what manner each of them is, at the same time, one and many.

Protarchus:: Would you but express your meaning more plainly, I might, perhaps, apprehend it.

Socrates:: I mean, then, by the two, which I propose to be now considered, the same which I mentioned at the first; one of them the infinite, and the other bound. That the infinite is, in. some manner, many, I will attempt to show: and let bound wait a while.

Protarchus:: It shall.

Socrates:: Give me now your attention. It is, I confess, a difficult and doubtful thing, that, which I would have you to consider. Consider it, however. First, with regard to hotter and colder, in things, see if you can think of any bound. Or would not the more and the less, residing in the kinds themselves of things, hinder, so long as they reside there, an end from being fixed to them? For, if ever they receive an end, to an end also are their very beings then brought.

Protarchus:: Most certainly true.

Socrates:: And in speaking of either the colder or the hotter of any two things, we constantly attribute to them the more and the less.

Protarchus:: And very much so.

Socrates:: Reason then constantly suggests to us that the colder and the hotter have no end: and being thus without any end, they are altogether boundless.

Protarchus:: I am strongly inclined to agree with you, Socrates in this point.

Socrates:: Well have you answered, my friend Protarchus; and well have you reminded me, that the strongly, which you mentioned, and the faintly, have the same power as the more and the less. For, wherever they reside, they suffer not any thing to be just so much; but infusing either the more intense or the more remiss into every action, they always produce in it either the more or the less; while the just so much flies away and vanishes from before them. For, as it was just now observed, were they not to drive away the just so much, or did they permit this, and the moderate, to enter into the regions of the more and the less, or of the intense and the remiss, these very beings must quit their own places: because, if they admitted the just so much, the hotter and the colder would be gone. For the hotter, and in like manner the colder, is always advancing forward, and never abides in the same spot: but the just so much stops, and stays, having finished its progress. Now, according to this reasoning, the hotter must be boundless; and so must also be the colder.

Protarchus:: So it appears indeed, Socrates. But, as you rightly said, it is not easy to apprehend these things. Questions, however, relating to them again and again repeated, might perhaps show that the questioner and the respondent were tolerably well agreed in their minds concerning them.

Socrates:: You say well: and we should try so to do. But at present, to avoid lengthening out this argument, by enumerating every infinite, consider, whether we may take this for the characteristic mark of the nature of all infinites.

Protarchus:: What mark do you mean?

Socrates:: Whatever things appear to us to be increasing or diminishing, or to admit of intenseness and remission, or the too much, and all other such attributes, we ought to refer all these to the genus of the infinite; collecting, as it were, all of them in one, agreeably to what was before said; that whatever things were divided and separated we ought to assemble together and combine, as well as we are able, affixing to all of them the mark of some one nature;—if you remember.

Protarchus:: I remember it well.

Socrates:: Every thing, then, which rejects all such attributes, and admits only such as are quite the contrary,—in the first place, the equal and equality, and, after the equal, the double, and every other relation which one number bears to another, and one measure to another,—all these things, I say, in summing up, and referring them to bound, think you not that we should do right? or how say you?

Protarchus:: Perfectly right, O Socrates.

Socrates:: Well: but the third thing made up, and consisting of the other two, what characteristic shall we assign to this?

Protarchus:: You, as I presume, will show it to me.

Socrates:: Divinity indeed may; if any of the Gods will hearken to my prayers.

Protarchus:: Pray, then, and survey.

Socrates:: I survey: and some God, O Protarchus, is now, methinks, become favorable to us.

Protarchus:: How do you mean? and by what sign do you know it?

Socrates:: I will tell you in plain words: but do you follow them closely.

Protarchus:: Only speak.

Socrates:: We mentioned just now the hotter and the colder; did we not?

Protarchus:: We did.

Socrates:: To these then add the drier and the moister; the more numerous and the fewer; the swifter and the slower; the larger and the smaller; and whatever things beside, in our late account of them we ranked under one head,—that which admits of the nature of the more and the less.

Protarchus:: You mean the infinite.

Socrates:: I do: and mingle together with this that which we spoke of next afterward,—the race of bound.

Protarchus:: What race do you mean?

Socrates:: Those things which we did not (as we ought to have done) assemble together under one head, in the same manner as we assembled together the race of the infinite. But you will now, perhaps, do what was then omitted. And when both the sorts are assembled, and viewed together, the race of bound will then become manifest.

Protarchus:: What things do you speak of? and how are they to be assembled?

Socrates:: I speak of that nature in which are comprised the equal and the double; and whatever else puts an end to contest between contrary things; and, introducing number, makes them to be commensurate one with another, and to harmonize together.

Protarchus:: I apprehend your meaning to be, that, from the commixture of those two, a certain progeny will arise between them in every one of their tribes.

Socrates:: You apprehend me rightly.

Protarchus:: Relate then the progeny of these commixtures.

Socrates:: In diseases, does not the right commixture of those two produce the *recovery of health*?

Protarchus:: Entirely so.

Socrates:: And in the acute and the grave, in the swift also and the slow, which are all of them infinite, does not the other sort, received among them and begetting bounds, constitute the perfection of all the Muse's art?

Protarchus:: Certainly so.

Socrates:: And in weather excessively either cold or hot, does not the entrance of that other kind take off the excess, the vehement, and the infinite,—generating in their stead, not only the moderate and the measured, but symmetry also, and correspondence between their measures?

Protarchus:: Without dispute.

Socrates:: And do not propitious seasons, and all their fair productions, arise to us from hence, from the mixture of things which are infinite with things which have a bound?

Protarchus:: Doubtless.

Socrates:: A thousand other things I forbear to mention; as, for instance, strength and beauty, the attendants upon health of body; and in the soul other excellencies, very many and very noble. For Venus herself, O good Philebus! observing lawless lust, and all manner of vice every where reigning, the love of pleasure being in all men boundless, and their desires of it insatiable, she herself established a law and an order, setting bounds to pleasure and desire. This you said was to lessen and to impair pleasure; but I maintain, that, on the contrary, it preserved pleasure from decay. And you, Protarchus! what think you of it?

Protarchus:: For my part, I am entirely of your mind, Socrates.

Socrates:: I have shown you then those three kinds, if you apprehend my meaning.

Protarchus:: Partly, I suppose, I do. By one of those three, I suppose, you mean the infinite; by another, the second sort, you mean that which in all beings is the bound; but what you mean by the third sort, I have no strong apprehension of.

Socrates:: Because the care of that third sort, my friend, has amazed you with its multitude. And yet, the infinite also appeared to contain many tribes: but as they were all of them stamped with the character of more and less, they were seen clearly to be one.

Protarchus:: True.

Socrates:: Then, as to bound; that neither contained many, nor found we any difficulty in admitting the nature of it to be one.

Protarchus:: How could we?

Socrates:: It was not at all possible, indeed. Of those two sorts, then, all the progeny,—all the things produced into being through those measures, which are effected in the immoderate, when bounds are set to the infinite,—in summing up all these things together, and comprehending them in one, understand me to mean, by the third sort, this one.

Protarchus:: I understand you.

Socrates:: Now, besides these three, we are further to consider, what that kind is which we said was the fourth. And as we are to consider it jointly, see whether you think it necessary, that all things which are produced into being should have some cause of their production.

Protarchus:: I think it is: for, without a cause, how should they be produced?

Socrates:: The nature then of the efficient differs from the cause in nothing but in name: so that the efficient and the cause may be rightly deemed one.

Protarchus:: Rightly.

Socrates:: So, likewise, the thing effected, and the thing produced into being, we shall find to differ in the same manner, in nothing but in name, or how?

Protarchus:: Just so.

Socrates:: In the nature of things, does not the efficient lead the way? and does not the effect follow after it into being?

Protarchus:: Certainly.

Socrates:: Cause, therefore, is not the same thing with that which is subservient to cause in the producing of its effect, but a thing different.

Protarchus:: Without doubt.

Socrates:: Did not the things which are produced into being, and the things out of which they are all of them produced, exhibit to us the three genera?

Protarchus:: Clearly.

Socrates:: That, then, which is the artificer of all these, the cause of them let us call the fourth cause; as it is fully shown to be different from those other three.

Protarchus:: Be it so.

Socrates:: But the four sorts having been now described, every one of them distinctly, we should do well, for memory's sake, to enumerate them in order.

Protarchus:: No doubt of it.

Socrates:: The first then I call infinite; the second bound; the third essence mixt and generated from these: and in saying that the cause of this mixture and this production is the fourth, should I say aught amiss?

Protarchus:: Certainly not.

Socrates:: Well now: what is next? How proceeds our argument? and with what design came we along this way? Was it not this? We were inquiring who had a right to the second prize of victory; whether Pleasure had, or Wisdom: was it not so?

Protarchus:: It was.

Socrates:: Now then, since we have thus divided these genera, may we not happily form a more finished judgment concerning both the very best and the second-best of those things which originally were the subjects of dispute between us?

Protarchus:: Perhaps we may.

Socrates:: We made no difficulty, I think, of setting down for conqueror, the mixt life, the life of pleasure and wisdom together. Was it not so?

Protarchus:: It was.

Socrates:: We perceive then of what sort the mixt life is, and to which kind it is to be referred.

Protarchus:: Evidently.

Socrates:: And I think we shall agree, that it is part of the third sort. For the mixt life is not to be referred solely to any one of the infinites, mixed with some one only of the bounds: it is a life of all such things together as are infinite in their own nature, but are under the restraint of bound. So that the mixt life, this winner of the prize, may be rightly said to be a part of the third sort.

Protarchus:: Most rightly.

Socrates:: It is well. But that life of yours, O Philebus, a life of pleasure simple and unmixed, to which of the three sorts may we rightly say that it belongs? But before you pronounce, answer me first to this question.

Philebus:: Propose it then.

Socrates:: Concerning pleasure and pain; have they in their own nature any bounds? or are they among those things which admit the more and the less?

Philebus:: Pleasure, O Socrates! to be sure, admits the more. For it would, not comprehend every good in it, if it were not by nature infinite, with respect to the multitude which it contains, and the increase which it is capable of.

Socrates:: Nor can pain be imagined, O Philebus, to comprehend every evil. So that we must consider of some other thing, different from the nature of the infinite, for the imparting of any good to pleasures. It is admitted, that your life of pleasure is the issue of things unbounded, and belongs, therefore, to the infinite. But to which of the sorts before mentioned, O Protarchus and Philebus, may we refer wisdom, and science, and intellect, without being guilty of impiety? For it appears to me that we incur no trifling danger in answering the present question, whatever be our answer, whether right or wrong.

Philebus:: You magnify that God of yours, O Socrates, very highly, methinks.

Socrates:: So do you, my friend, that Goddess of yours. The question, however, ought to be answered by us.

Protarchus:: Socrates says what is right, O Philebus, and we must do as he says we ought.

Philebus:: Have not you, Protarchus, taken upon yourself my part in the debate?

Protarchus:: It is true that I have. But in the present case I find myself much at a loss how to answer. I must therefore request, O Socrates, that you yourself will take the office of prophet to us; lest, by some mistake, I should offend the combatant whom you favor, and by singing out of tune should spoil the harmony.

Socrates:: You must be obeyed, Protarchus. Indeed there is nothing difficult in your injunctions. But, in asking you to which of the two above-mentioned kinds intellect and science were to be referred,—when I was magnifying, as Philebus says, the subject of my question,—the joke, which I intended to soften the solemnity of it, confused your thoughts, I find, in good earnest.

Protarchus:: Very thoroughly so, I confess, O Socrates.

Socrates:: And yet it was an easy question. For, on this point, there is a consent and harmony among all the wise, dignifying thus themselves,—that Intellect is king of heaven and earth. And this which they say is perhaps well said. But let us, if you are willing, consider the nature of this genus more amply, and not in so concise a manner.

Protarchus:: Consider it in what manner you think best, without regarding the length of the inquiry: for the length will not be disagreeable to us.

Socrates:: Fairly spoken. Let us begin, then, by proposing this question.

Protarchus:: What?

Socrates:: Whether shall we say that the power of the irrational principle governs all things in the whole universe, fortuitously and at random? or shall we, on the contrary, agree with our ancestors and predecessors, in affirming that a certain admirable intellect and wisdom orders all things together, and governs throughout the whole?

Protarchus:: Alike in nothing, O Socrates, are these two tenets. That which you mentioned just now is, in my opinion, impious. But, to hold that Intellect disposes all things in a beautiful order, is agreeable to that view which we have of the world, of the celestial bodies, and of the whole circumvolution of the heavens. For my own part, I should never speak nor think any otherwise on this subject.

Socrates:: Is it then your pleasure that we add our voices to those of the ancients, and openly avow that tenet to be ours; not contenting ourselves with a bare repetition of the sayings of others, in hopes of escaping danger to ourselves; but resolved to run all risk together, and to share in undergoing the censures of some great and formidable man, when he asserts that in the whole of things there is no order?

Protarchus:: How can I do otherwise than join with you in this?

Socrates:: Attend now to the argument which comes on next to be considered.

Protarchus:: Propose it then.

Socrates:: In the bodies of all animals, somehow, we discover that fire, water, and air, must be in their composition by nature; and earth, which gives support to the other ingredients in their frame, we see plainly: as mariners say, when they are tossed about in a thunder-storm at sea, and descry land.

Protarchus:: True: and tossed about indeed are we too in these discourses; but for a port to anchor in we are entirely at a loss.

Socrates:: Let us proceed then: Concerning each of those elementary ingredients in our frame, understand this.

Protarchus:: What?

Socrates:: That which there is in us of each element is small and inconsiderable; no where in any part of our frame have we it at all unmixed and pure; neither has it in us a power worthy of its nature. Take one of them for a sample, by which you may estimate all the rest. Fire in some manner there is in us; fire there is also in the universe.

Protarchus:: Most certainly.

Socrates:: Now the fire which is in our composition is weak and inconsiderable: but that which is in the universe is admirable for the multitude of it, for the beauty which it exhibits, and for every power and virtue which belong to fire.

Protarchus:: Perfectly true.

Socrates:: Well then: is the fire of the universe generated, fed, and ruled by the fire which we have in us? or, on the contrary, does my fire, and yours, and that of every other living thing, receive its being, support, and laws, from the fire of the universe?

Protarchus:: This question of yours does not deserve an answer.

Socrates:: Rightly said. And you would answer in the same manner, I suppose, if your opinion was asked concerning the earthy part of every animal here, compared with the earth in the universe; and just so concerning the other elementary parts of animal bodies mentioned before.

Protarchus:: What man, who made a different answer, would ever appear to be of sound mind?

Socrates:: Scarcely would any man. But attend to what follows next. Wherever we find these four elements mixed together and united, do we not give to this composition the name of body?

Protarchus:: We do.

Socrates:: Apprehend the same thing then with regard to this, which we call the world. This should be considered as a body in the same manner, being composed of the same elements.

Protarchus:: You are perfectly in the right.

Socrates:: To the whole of this great body, then, does the whole of that little body of ours owe its nourishment, and whatever it has received, and whatever it possesses? or is the body of the universe indebted to ours for all which it is and has?

Protarchus:: There is no reason, O Socrates, for making a question of this point, neither.

Socrates:: Well: what will you say to this point then?

Protarchus:: What point?

Socrates:: Must we not affirm these bodies of ours to be animated with souls?

Protarchus:: It is evident that we must.

Socrates:: But from whence, O my friend Protarchus, should our bodies derive those souls of theirs, if that great body of the universe, which has all the same elements with our bodies, but in much greater purity and perfection, was not, as well as ours, animated with a soul?

Protarchus:: It is evident, O Socrates, that from no other origin could they derive them.

Socrates:: Since, therefore, O Protarchus, we acknowledge these four genera, bound, infinite, the compound of both those, and the genus of cause, to be in all bodies; and since we find, that in this part of the universe to which we belong there are beings of that fourth sort,—causes, which produce souls, build up bodies for those souls to dwell in, and heal those bodies when diseased;—causes, also, which create and frame other compositions, and amend them when impaired;—causes these, to every one of which we gave a particular name, betokening a particular kind of wisdom or skill:—since, I say, we are persuaded of these things, surely we can by no means think that the whole heaven, in the larger parts of which are the same four genera, and these undepraved and pure, can have any other cause than a nature who is full of contrivance and design, and in whom the most beautiful and noble things all unite.

Protarchus:: It would not be at all reasonable to think it can.

Socrates:: If this then be absurd, we may the better assert, as a consequence of our reasoning, that in the universe there are, what we have several times repeated, infinite in great quantity, and bound sufficient; and besides these, a cause, not inconsiderable or mean, which, by mixing them properly together, marshals and regulates the years, the seasons, and the months,—a cause, which with the greatest justice we may term wisdom and intellect.

Protarchus:: With the greatest justice, indeed.

Socrates:: But further, wisdom and intellect could never be without soul.

Protarchus:: By no means.

Socrates:: You will affirm, then, that in the nature of Jupiter there is a kingly soul and a kingly intellect, through the power of cause; and that in the other Gods there are other beautiful things, whatever they are, by which their

Deities love to be distinguished, and from which they delight in taking their respective denominations.

Protarchus:: Certainly I shall.

Socrates:: The discourse we have now had together on this subject, O Protarchus, think it not idle, and to no purpose. For it supports that doctrine of our ancestors, that the universe is for ever governed by intellect.

Protarchus:: Indeed it does.

Socrates:: And besides, it has furnished us with an answer to my question,—to what genus intellect is to be referred; in making it appear that intellect is allied to that which we said was the cause of all things, one of our four genera. For now at length you plainly have our answer.

Protarchus:: I have; and a very full and sufficient answer it is: but I was not aware what you were about.

Socrates:: A man's attention to serious studies, O Protarchus, is sometimes, you know, relaxed by amusements.

Protarchus:: Politely said.

Socrates:: And thus, my friend, to what genus intellect belongs, and what power it is possessed of, has been now known tolerably well for the present.

Protarchus:: It has, indeed.

Socrates:: And to what genus also belongs pleasure, appeared before.

Protarchus:: Very true.

Socrates:: Concerning these two, then, let us remember these conclusions. that intellect is allied to cause, and is nearly of this genus; and that pleasure is infinite in her own nature, and belongs to that genus which, of itself, neither has nor ever will, have in it either a beginning, or a middle, or an end.

Protarchus:: We shall not fail to remember them both.

Socrates:: Now we ought to consider next, in which genus either of those two things, intelligence and pleasure, is found to have a seat; and in what state or condition those beings must be in whom either of them is produced, at the time of its production. And first in the case of pleasure: for, as we inquired to which genus she belonged, before we considered of which sort was intellect; so, with regard to the points also now proposed, she is the first to be examined. But, separately from the consideration of pain, we should never be able fully to explore the nature of pleasure.

Protarchus:: Well: if we are to proceed in this way, let us then in this way proceed.

Socrates:: Are you of the same opinion with me concerning their rise and production?

Protarchus:: What opinion is that?

Socrates:: Pain and pleasure appear to me, both of them to arise, according to nature, in that which is a common genus.

Protarchus:: Remind us, friend Socrates, which of the genera mentioned before is meant by the term common.

Socrates:: What you desire, O wonderful man! shall be done, to the best of my ability.

Protarchus:: Fairly said.

Socrates:: By this common genus, then, we are to understand that which, in recounting the four sorts, we reckoned as third.

Protarchus:: That which you mentioned next after both the infinite and bound: that in which you ranked health, and also, as I think, harmony.

Socrates:: Perfectly right. Now give me all possible attention.

Protarchus:: Only speak.

Socrates:: I say, then, that whenever the harmony in the frame of any animal is broken, a breach is then made in its constitution and at the same time rise is given to pains.

Protarchus:: You say what is highly probable.

Socrates:: But when the harmony is restored, and the breach is healed, we should say that then pleasure is produced: if points of so great importance may be dispatched at once in so few words.

Protarchus:: In my opinion, O Socrates, you say what is very true: but let us try if we can show these truths in a light still clearer.

Socrates:: Are not such things as ordinarily happen, and are manifest to us all, the most easy to be understood?

Protarchus:: What things do you mean?

Socrates:: Want of food makes a breach in the animal system, and at the same time gives the pain of hunger.

Protarchus:: True.

Socrates:: And food, in filling up the breach again, gives a pleasure.

Protarchus:: Right.

Socrates:: Want of drink also, interrupting the circulation of the blood and humors, brings on us corruption, together with the pain of thirst; but the virtue of a liquid, in moistening and replenishing the parts dried up, yields a pleasure. In like manner, preternatural suffocating heat, in dissolving the texture of the parts, gives a painful sensation: but a cooling again, a refreshment agreeable to nature, affects us with a sense of pleasure.

Protarchus:: Most certainly.

Socrates:: And the concretion of the animal humors through cold, contrary to their nature, occasions pain: but a return to their pristine state of fluidity, and a restoring of the natural circulation, produce pleasure. See, then, whether you think this general account of the matter not amiss, concerning that sort of being which I said was composed of infinite and bound,—that, when by nature any beings of that sort become animated with soul, their passage into corruption, or a total dissolution, is accompanied with pain; and their entrance into existence, the assembling of all those particles which compose the nature of such a being, is attended with a sense of pleasure.

Protarchus:: I admit your account of this whole matter; for, as it appears to me, it bears on it the stamp of truth.

Socrates:: These sensations, then, which affect the soul by means only of the body, let us consider as one species of pain and pleasure.

Protarchus:: Be it so.

Socrates:: Consider now the feelings of the soul herself, in the expectation of such a pain or of such a pleasure,—antecedent to the pleasure expected, an agreeable feeling of hope and alacrity,—antecedent to the pain expected, the uneasiness of fear.

Protarchus:: This is, indeed, a different species of pleasure and pain, independent of the body, and produced in the soul herself through expectation.

Socrates:: You apprehend the matter rightly. Now the consideration of these feelings of pain and pleasure, which immediately affect the soul herself, (and seem to be produced in her, each of them unmixed and genuine,) will, as I imagine, clear up that doubt concerning pleasure,—

whether the whole kind be eligible, or whether a particular species of it be the proper object of our choice. And in the latter case, pleasure and pain (in general), like heat and cold, and all other things of this sort, will deserve sometimes to be embraced, and at other times to be rejected; as not being good in themselves, but admitting the nature of good to be superadded to them only at some times, and some of them only.

Protarchus:: You are perfectly in the right. It must be in some such way as this that we ought to investigate the things we are in pursuit of.

Socrates:: If, then, what we agreed in be true,—that animal bodies feel pain, when any thing befalls them tending to their destruction,—pleasure, when they are using the means of their preservation,—let us now consider what state or condition every animal is in, when it is neither suffering aught that tends to its destruction, nor is engaged in any action, or in the midst of any circumstances, tending to its preservation. Give your earnest attention to this point, and say, whether it is entirely necessary, or not, that every animal at that time should feel neither pain nor pleasure, in any degree, great or small.

Protarchus:: It is quite necessary.

Socrates:: Besides the condition then of an animal delighted, and besides the opposite condition of it under uneasiness, is not this a different, a third, state or condition of an animal?

Protarchus:: Without dispute.

Socrates:: Be careful then to remember this judgment of ours. For on the remembering of it, or not, greatly will depend our judgment concerning the nature of pleasure.

But, to go through with this point, let us, if you please, add a short sentence more.

Protarchus:: Say what.

Socrates:: You know, nothing hinders a man who prefers the life of wisdom from living all his life in that state.

Protarchus:: In the state, do you mean, of neither pleasure nor uneasiness?

Socrates:: I do: for, when we compared together the different lives, it was supposed, that whoever should choose the life of intellect and wisdom was not to have pleasure either in a great or in a small degree.

Protarchus:: That was the supposition.

Socrates:: He must live, therefore, such a life. And perhaps it is by no means absurd, to deem that life to be of all lives the most God-like.

Protarchus:: It is not indeed probable, that the Gods feel either the pleasurable sensation, or its opposite.

Socrates:: Highly, indeed, is it improbable. For neither of them is consistent with the divine nature. But we shall consider further of this point afterwards, if it should appear to be of any service to our argument; and shall apply it to the purpose of winning the second prize for intellect, though we should not be able to make use of it so as to win for her the first.

Protarchus:: Very justly said.

Socrates:: Now that species of pleasure which we said is proper to the soul herself, is all produced in her by means of memory.

Protarchus:: How so?

Socrates:: But, before we consider of this point, I think we should premise some account of memory,—what it is: and still prior to an account of memory, some mention too, methinks, ought to be made of sense, if we are to have this subject appear tolerably plain to us.

Protarchus:: Explain your meaning.

Socrates:: Of those things which are incident to our bodies in every part, coming from all quarters around us, and affecting us in various ways,—some spend all their force upon the body, without penetrating to the soul, leaving this entirely untouched and free; others extend their power through the soul as well as through the body; and some of this latter sort excite a vehement agitation in them both, jointly and severally. Do you admit this?

Protarchus:: Be it admitted.

Socrates:: If we should say of those things, the power of which is confined to the body, and reaches not the soul, that the soul is deprived of knowing them; but of other things which befall us, and have a power to pervade both the body and the soul, that of these the soul hath the knowledge; should we not thus say what is most true?

Protarchus:: Without dispute.

Socrates:: But when I say that the soul is deprived of knowing the former sort, do not suppose my meaning to be, that oblivion happens to her in this case. For oblivion is the departure of memory. But of the accidents now spoken of the soul never had a memory. And of that which neither is nor ever was, it is absurd to say that any loss can happen to us. Is it not?

Protarchus:: Undoubtedly.

Socrates:: Only then alter the terms.

Protarchus:: In what manner?

Socrates:: Instead of saying that the soul is deprived of knowing what the body suffers, when she is not affected by any motions produced in the body by those ordinary occurrences,—what we termed a privation of knowledge, let us now term insensibility.

Protarchus:: I apprehend your meaning.

Socrates:: But when the soul and the body are affected, both of them in common, by any of those occurrences, and in common also are moved or agitated,—in giving to this motion the name of sensation, you would not speak improperly.

Protarchus:: Very true.

Socrates:: Now then do we not apprehend what it is which is commonly called sense or sensation?

Protarchus:: What should hinder us?

Socrates:: And of memory, if one should say that it was the retaining of sensations, it would not be ill defined, in my opinion.

Protarchus:: I think so too.

Socrates:: Do we not hold, that memory differs from remembrance?

Protarchus:: Perhaps it does.

Socrates:: Do they not differ in this respect?

Protarchus:: In what respect?

Socrates:: When the soul alone, unaided by the body, recovers and resumes within herself as much as possible the state which heretofore she was in, when she was affected jointly with the body, we say that the soul then remembers. Do we not?

Protarchus:: Certainly we do.

Socrates:: So we do also, when the soul, after having lost the memory of something which she had sensibly perceived, or of something which she had learnt, recalls and recollects the memory of it again, herself within herself: and all this we term remembrance, and a recovery of things slipt out of our memory.

Protarchus:: Very true.

Socrates:: Now the end for the sake of which we have been considering these faculties of the soul is this.

Protarchus:: For the sake of what?

Socrates:: That we may apprehend, as well and as clearly as we are able, what is the pleasure of the soul abstracted from the body, and at the same time may apprehend also what is desire. For the nature of both these things seems to be discovered in some measure by showing the nature of memory and of remembrance.

Protarchus:: Let us then, O Socrates, now explain how such a discovery follows from perceiving the nature of these faculties of ours.

Socrates:: In treating of the rise of pleasure, and of the various forms which she assumes, it will be necessary for us, I believe, to consider a great variety of things. But, before we enter on so copious a subject, we should now, I think, in the first place, consider the nature and origin of desire.

Protarchus:: Let us then: for we must not lose any thing.

Socrates:: Nay, Protarchus! we shall lose one thing, when we shall have found the objects of our inquiry; we shall lose our uncertainty about them.

Protarchus:: You are right in your repartee. Proceed we then to what is next.

Socrates:: Was it not just: now said, that hunger, and thirst, and many other things of like kind, were certain desires?

Protarchus:: Without doubt.

Socrates:: What is it, then, which is the same in all these things,—that, with respect to which we give to all of them notwithstanding the great difference between them one and the same appellation?

Protarchus:: By Jupiter, Socrates! it is, perhaps, not easy to say: it ought, however, to be declared.

Socrates:: Let us resume the mention of that with which we began the consideration of this subject.

Protarchus:: Of what in particular?

Socrates:: Do we not often speak of being thirsty?

Protarchus:: We do.

Socrates:: And do we not mean by it some kind of emptiness?

Protarchus:: Certainly.

Socrates:: Is not thirst a desire?

Protarchus:: It is.

Socrates:: A desire of drink is it?

Protarchus:: Of drink.

Socrates:: Of being replenished by drink: is it not?

Protarchus:: I suppose it is.

Socrates:: Whoever of us then is emptied, desires, it seems, a condition the reverse of what has befallen him. For whereas he is emptied, he longs to be filled again.

Protarchus:: Most evidently so.

Socrates:: Well now: is it possible that a man, who at the first is empty, should apprehend, either by sense or by memory, what it is to be full,—a condition, in which he neither is at the time, nor ever was heretofore.

Protarchus:: How can he?

Socrates:: We are agreed, that the man who desires has a desire of something.

Protarchus:: Without dispute.

Socrates:: Now it is not the condition in which he is that he desires. For he suffers thirst, that is, an emptiness: but he desires to be full.

Protarchus:: True.

Socrates:: Something, therefore, belonging to the man who is thirsty must apprehend in some manner what it is to be full.

Protarchus:: It must, of necessity.

Socrates:: But it is impossible that this should be his body: for his body is supposed to suffer emptiness.

Protarchus:: Right.

Socrates:: It remains, therefore, that his soul apprehends what it is to be full, by means of her memory.

Protarchus:: Plainly so.

Socrates:: For, indeed, by what other means could his soul have such an apprehension?

Protarchus:: Hardly by any other.

Socrates:: Perceive we now, what consequence follows from this reasoning of ours?

Protarchus:: What consequence?

Socrates:: It proves that desire doth not a rise in the body.

Protarchus:: How so?

Socrates:: Because it shows that the aim and endeavor of every animal is to be in a condition opposite to the feelings with which the body is at that time affected.

Protarchus:: It certainly shows this.

Socrates:: And the inclination by which it moves toward this opposite condition, shows the remembrance of a condition opposite to those present feelings and affections.

Protarchus:: Clearly.

Socrates:: Our reasoning, then, in proving that memory leads us toward the objects of our desire, shows at the same time what is the general inclination and desire of the soul; and what is the moving principle in every animal.

Protarchus:: Perfectly right.

Socrates:: Our conclusion, therefore, will by no means admit of an opinion that the body suffers hunger, or thirst, or is affected with any other such desire.

Protarchus:: Most true.

Socrates:: Let us observe this also further, regarding these very subjects now under consideration. Our reasoning seems to me as if it meant to exhibit in those very things a certain kind of life.

Protarchus:: What things do you mean? and what kind of life do you speak of?

Socrates:: I mean the being filled, and the being emptied, and all other things tending either to the preservation of animal life, or to the destruction of it; and whatever things ordinarily give pain,—yet, coming in a change from things contrary, are sometimes grateful.

Protarchus:: True.

Socrates:: But what when a man is in the midst of these contrary conditions, and is partaking of them both?

Protarchus:: How do you mean in the midst?

Socrates:: When he is afflicted with an anxious sense of his present bad condition, but at the same time has a remembrance of past delights; he may enjoy an intermission of his pain, without having as yet the cause of it removed; now do we affirm, or do we deny, that he is at that time in the midst of two contrary conditions?

Protarchus:: It must be affirmed.

Socrates:: Is he afflicted or delighted wholly?

Protarchus:: By Jupiter, he is in a manner afflicted doubly: in his body, from his present condition; in his soul, from a tedious expectation, longing for relief.

Socrates:: How is it, O Protarchus, that you suppose his affliction to be doubled? Is not a man whose stomach is empty sometimes in a state of hopefulness, with assurance of having it filled? and on the contrary, is he not at other times in a condition quite hopeless?

Protarchus:: Certainly.

Socrates:: Do you not think that, when he is in hopes of being filled, he is delighted with the remembrance of fullness? and yet that, being empty at the same time, he is in pain?

Protarchus:: He must be so.

Socrates:: In such a state, therefore, man and other animals are at the same time afflicted and delighted.

Protarchus:: It seems so to be.

Socrates:: But what think you when a man is empty, and hopeless of obtaining fullness? must he not, in such a condition, suffer double pain? with a view to which particular condition it was, that just now you supposed the memory of past delight, in all cases, to double the present pain.

Protarchus:: Most true, Socrates.

Socrates:: Now of this inquiry into these feelings of ours we shall make this use.

Protarchus:: What use?

Socrates:: Shall we say that all these pains and pleasures are true? or that they are all false? or that some of them are true, and others false?

Protarchus:: How should pleasures or pains, O Socrates, be false?

Socrates:: Show is it then, O Protarchus, that fears may be either true or false? that expectations may be true, or not? Or, of opinions, how is it that some are true, and others false?

Protarchus:: Opinions, I admit, may be of either kind: but I cannot grant you this of those other feelings.

Socrates:: How say you? We are in danger of starting a disquisition of no small importance.

Protarchus:: That is true.

Socrates:: But whether it has any relation to the subjects which have preceded, this, O son of an illustrious father! ought to be considered.

Protarchus:: Perhaps, indeed, it ought.

Socrates:: Tell me then: for, as to myself, I am continually in a state of wonderment about these very difficulties now proposed.

Protarchus:: What difficulties do you mean?

Socrates:: False pleasures are not true; nor true pleasures false.

Protarchus:: How is it possible they should?

Socrates:: Neither in a dream, then, nor awake, is it possible, as you hold, not even if a man is out of his senses through madness, or has lost the soundness of his judgment any other way, is it possible for him ever to imagine that he feels delight, when he is by no means sensibly delighted; or to imagine that he feels pain, when actually the man feels none.

Protarchus:: All of us, O Socrates, constantly suppose these facts to be as you have now stated them.

Socrates:: But is it a right supposition? or should we examine whether it is right, or not?

Protarchus:: We ought to examine it, I must own.

Socrates:: Let us then explain a little more clearly what was just now said concerning pleasure and opinion. Do we not hold the reality of our having an opinion?

Protarchus:: Certainly.

Socrates:: And the reality of our having pleasure?

Protarchus:: To be sure.

Socrates:: Further: it is something, that which is the object of our opinion.

Protarchus:: Without doubt.

Socrates:: And something also that is with which whatever feels a pleasure is delighted.

Protarchus:: Most certainly.

Socrates:: In the having, then, of an opinion, whether we are right or wrong in entertaining that opinion, the reality of our having it abides still.

Protarchus:: How can a man lose an opinion whilst he has it?

Socrates:: In the enjoying also of any pleasure, whether we do right or wrong to enjoy it, it is certain that the reality of the enjoyment still remains.

Protarchus:: To be sure, these things are so.

Socrates:: On what account is it, then, that we are used to call some opinions true, and others false; yet to pleasures only we allow the attribute of true; notwithstanding that pleasure and opinion, both of them equally admit reality in the having of them?

Protarchus:: This ought to be considered.

Socrates:: Is it that falsehood and truth are incident to opinion? so that, by the supervening of one or other of these, opinion becomes something beside what in itself it is; and every opinion is thus made to have the quality of being either false or true. Do you say that this ought to be considered?

Protarchus:: I do.

Socrates:: And beside this: supposing that opinions universally do admit of attributes and qualities; whether only pleasure and pain are what they are in themselves simply, and never admit any quality to arise in them; ought we not to settle this point also by agreement between us?

Protarchus:: It is evident that we ought.

Socrates:: But it is easy enough to perceive, that these also admit the accession of some qualities. For of pleasures and pains we agreed awhile since, that some are great, others little; and that each sort admits of vehemence and of intension.

Protarchus:: Very true.

Socrates:: And if either to any pleasure, or to any opinion, there be added the quality of evil, shall we not affirm the opinion thus to become evil, and the pleasure evil in the same manner?

Protarchus:: Without doubt, O Socrates.

Socrates:: And what, if rectitude, or the opposite to rectitude, accede to any of them shall we not say, that the opinion is right, if rectitude be in it? and shall we not ascribe the same quality to pleasure, on the same supposition?

Protarchus:: Of necessity we must.

Socrates:: And if the object of our opinion be mistaken by us, must we not in such a case acknowledge that our opinion is erroneous, and not right; and that we are not right ourselves in entertaining such an opinion?

Protarchus:: Certainly we must.

Socrates:: But what, if we discover ourselves to be mistaken in the object of our grief or of our pleasure, shall we give to this grief or to this pleasure, the epithet of right, or good, or any other which is fair and honorable?

Protarchus:: We certainly cannot, where a mistake is in the pleasure.

Socrates:: And surely pleasure is apt to arise in us oftentimes, accompanied, not with a right opinion, but with an opinion which is false.

Protarchus:: Indisputably so. And the opinion, O Socrates, then and in that case, we should say was a false opinion. But to the pleasure itself no man would ever give the appellation of false.

Socrates:: You are very ready, O Protarchus, at supporting the plea made use of by Pleasure on this occasion.

Protarchus:: Not at all so. I only repeat what I have heard.

Socrates:: Do we make no difference, my friend, between such a pleasure as comes accompanied with right opinion or with science, and that kind of pleasure which often arises in every one of us at the same time with false opinion or ignorance?

Protarchus:: It is probable, I own, that no little difference is between them.

Socrates:: Let us now come to the consideration of what the difference is.

Protarchus:: Proceed in whatever way you think proper.

Socrates:: I shall take this way then.

Protarchus:: What way?

Socrates:: Some of our opinions are false, and others of them are true: this is agreed.

Protarchus:: It is.

Socrates:: Pleasure and pain, as it was just now said, oftentimes attend on either of them indifferently; on opinions, I mean, either true or false.

Protarchus:: Certainly so.

Socrates:: Is it not from memory and from sense that opinion is produced in us, and that room is given for a diversity of opinions on every subject?

Protarchus:: Most undoubtedly.

Socrates:: I ask you, then, whether or no, as to these things, we deem ourselves to be of necessity affected thus?

Protarchus:: How?

Socrates:: Oftentimes, when a man looks at something which he discovers at a great distance, but does not discern very clearly, will you admit that he may have an inclination to judge of what he sees?

Protarchus:: I do admit the case.

Socrates:: Upon this, would not the man question himself in this manner?

Protarchus:: In what manner?

Socrates:: What is that which appears as if it was standing under some tree by the cliff there? Do you not suppose that he would speak those words to himself, looking at some such appearances before him, as I have mentioned?

Protarchus:: No doubt of it.

Socrates:: Hereupon, might not this man then, making a conjecture, say to himself, by way of answer,—It is a man?

Protarchus:: Certainly.

Socrates:: But walking on, perhaps he might discern it to be but the work of some shepherds, and would say again to himself,—It is only a statue.

Protarchus:: Most certainly he would.

Socrates:: And if he had any companion with him, he would speak out aloud what he had first spoken within himself, and repeat the very same words to his companion: so that what we lately termed an opinion would thus become a speech.

Protarchus:: Very true.

Socrates:: But if he were alone, this very thing would be a thought still within him; and he might walk on, keeping the same thought in his mind, a considerable way.

Protarchus:: Undoubtedly.

Socrates:: Well now: does this matter appear to you in the same light as it does to me?

Protarchus:: How is that?

Socrates:: The soul in that case seems to me to resemble some book.

Protarchus:: How so?

Socrates:: The memory, coinciding with the senses, together with those passions of the soul which attend this memory and the present sensation, seem to me as if they concurred in writing sentences at that time within our souls. And when the scribe writes what is true, true opinions and true sentences are by him produced within us: but when our scribe writes what is false, then what we think, and what we say to ourselves, is contrary to the truth.

Protarchus:: I heartily agree to your account of this matter, and acknowledge those joint scribes within the soul.

Socrates:: Acknowledge also another workman within us, operating at that time.

Protarchus:: What is he?

Socrates:: An engraver, who follows after the scribe; engraving within the soul images of those thoughts, sentences, and sayings.

Protarchus:: How and when is this done?

Socrates:: It is, when that which a man thinks and says to himself, concerning the object, of his sight, or of any other outward sense, he separates from the sensation which he has of it; and views somehow within himself the image of that thought, and of that saying. Or is there no such thing as this ever produced within us?

Protarchus:: Nothing is more certain.

Socrates:: The images of true thoughts and true sentences, are they not true? and the images of those which are false, are they not themselves also false?

Protarchus:: Undoubtedly.

Socrates:: Now if we have pronounced thus far rightly, let us proceed to the consideration of one point further.

Protarchus:: What is that?

Socrates:: Whether all the operations of this kind, such as are naturally performed within our souls, regard only things present and things past, but not things to come; or whether any of them have a reference to these also.

Protarchus:: Difference of time makes no difference in these matters.

Socrates:: Did we not say before, that pleasures and pains of the soul, by herself, arise in us prior to those pleasures and pains which affect the body? so as that we feel antecedent joy and grief in the prospect of things to come hereafter.

Protarchus:: Very true.

Socrates:: Those writings, then, and those engravings, which, as we held just now, are performed within us, do they respect the past and the present time only? and have they no concernment with the future?

Protarchus:: About the future very much are they concerned, and chiefly.

Socrates:: In saying this, do you mean that all these things are expectations of the future; and that we are, all of us, throughout life, full of expectations?

Protarchus:: The very thing I mean.

Socrates:: Now, then, since we are thus far agreed, answer to this further question.

Protarchus:: What is it?

Socrates:: A man who is just, and pious, and entirely good, is he not beloved by Divinity?

Protarchus:: Undoubtedly.

Socrates:: And what of the unjust and entirely bad man? is not the reverse of it true of him?

Protarchus:: How can it be otherwise?

Socrates:: Now every man, as we said just now, is full of a multitude of expectations.

Protarchus:: True.

Socrates:: Sayings there are, written within every one of us, to which we give the name of expectations.

Protarchus:: There are.

Socrates:: And fantasies also, engraven in us. Thus, for instance, a man often sees in imagination plenty of money flowing into him, and by those means many pleasures surrounding him; and views himself, engraven within himself, as highly delighted.

Protarchus:: That often is the case.

Socrates:: Of these engravings, shall we say that good men, because of the divine favor, have generally those which are true; and bad men, generally those of the contrary sort? or shall we deny it?

Protarchus:: It cannot be denied.

Socrates:: Bad men, then, have pleasures engraven within them also; but these are of the false sort.

Protarchus:: No doubt of it.

Socrates:: Wicked men, therefore, delight mostly in false pleasures; the good, in pleasures which are true.

Protarchus:: It must of necessity be so.

Socrates:: According to this account, there are, in the souls of men, such pleasures as are false; though in a most ridiculous manner they imitate, and would fain pass for, true pleasures: pains also there are with the like qualities.

Protarchus:: Such pleasures and such pains there are.

Socrates:: May not a man who indulges fancy at random, and embraces opinions of any kind whatever, always really think and believe some things to be, which neither are nor ever were, and sometimes such as never will be?

Protarchus:: Certainly.

Socrates:: And they are the false semblances and seemings of these unreal things, which produce in him those false opinions, and occasion him to think thus falsely. Are they not?

Protarchus:: They are.

Socrates:: Well then: should we not say of the pains and pleasures felt by those bad men, that their condition corresponds with the case of false opinions?

Protarchus:: How do you mean?

Socrates:: May not a man who courts and embraces pleasure at random, pleasure in general, of any kind whatever, may not such a man always really feel delight from things which are not, and sometimes from things which never were,—often too, and perhaps the most frequently, from things which will never be?

Protarchus:: This must of necessity be granted.

Socrates:: Should not the same be said of fears and desires, and all things of the like sort, that these also are sometimes false?

Protarchus:: Certainly.

Socrates:: Well now: can we say of opinions, that they are bad, or that they are good, any otherwise than as they prove to be false, or prove to be true?

Protarchus:: No otherwise.

Socrates:: And I should think, that pleasures too we apprehend not to be bad on any other account, than as they are false.

Protarchus:: Quite the contrary, O Socrates. For hardly would any man put to the account of falsehood any of the evils brought on by pain and pleasure; since many and great evils accede to them from other quarters.

Socrates:: Pleasures which are evil, through the evil they occasion, we shall speak of by and by, if we shall continue to think it requisite: but we are now to speak of a multitude of pleasures felt by us, and frequently arising in us,—pleasures which are false in yet another way. And this other way of considering pleasure we shall have occasion, perhaps, to make use of in forming a right judgment of the several sorts of it.

Protarchus:: By all means let us speak of these, if any such pleasures there are.

Socrates:: And there are such, O Protarchus, in my opinion. But as long as this opinion lies by us unexamined, it is impossible For it to become certain or incontestable.

Protarchus:: Fairly said.

Socrates:: Now, therefore, let us advance to this other argument, like champions to the combat.

Protarchus:: Come we on then.

Socrates:: We said, if we remember, a little while since, that as long as the wants of the body, which are called desires in us, remain unsatisfied, the body all that time will be affected distinctly, and in a different manner from the soul.

Protarchus:: We remember that it was so held.

Socrates:: In such a case, that within us, which desired, would be the soul, desiring to have her body in a state contrary to its present condition; and that which felt uneasiness or pain from the condition it was in, would be the body.

Protarchus:: Things would be thus with us.

Socrates:: Now compute these things together, and consider the amount.

Protarchus:: Say what.

Socrates:: In such a case, it comes out that pains and pleasures are placed together, each by the other’s side; and that together, each by the other’s side, arise in us a feeling of emptiness, and a desire of its contrary, fullness: for so it has just now appeared.

Protarchus:: It is indeed apparent.

Socrates:: Has not this also been said? and does it not remain with us a point settled between us by agreement?

Protarchus:: What?

Socrates:: That pain and pleasure, both of them admit of the more and of the less; and that they both are of the infinites.

Protarchus:: It was so said and agreed.

Socrates:: Is there not, then, some way in which we may judge of pain and pleasure rightly?

Protarchus:: What way, and how do you mean?

Socrates:: In judging of them are we not wont, in every case, readily to try them by these marks,—which of them is the greater, and which is the less,—which of them hath the nature of its kind the most,—and which is more intense than the other,—in comparing either a pain with a pleasure, or one pain with another pain, or one pleasure with another pleasure?

Protarchus:: Such comparisons are often made: and from these comparisons we are wont to form our judgment and our choice.

Socrates:: Well now: in the case of magnitudes, does not the distance of visible objects, some of which are seen remote, and others near, render their real magnitudes uncertain, obscuring the truth of things, and producing false opinions? and does not the same thing hold true with regard to pains and pleasures? is not the same effect produced by the same means in this case also?

Protarchus:: Much more feelingly, O Socrates.

Socrates:: But in this case it happens contrary to what was in the case mentioned a little before.

Protarchus:: What happens, say you?

Socrates:: In that case, the true and the false opinions entertained by us impart to the pains and pleasures which attend them their own qualities of truth and falsehood.

Protarchus:: Very right.

Socrates:: But, in the case which I am now speaking of, the pains and pleasures being viewed afar off and near, continually changing [their aspects with their distances], and being set in comparison together, [it happens that] the pleasures [at hand] compared with the [remote] pains, appear greater and more intense [than they really are], and [that] the pains, compared with the pleasures, [have an appearance] quite the contrary.

Protarchus:: Such appearances must of necessity arise by these means.

Socrates:: As far, therefore, as the pains and pleasures appear less or greater than they really are, if from the reality you separate this appearance of what neither of them is, and take it by itself thus separated, you will not say that it is a right appearance; nor will you venture to assert, that this additional part of pain and pleasure is right and true.

Protarchus:: By no means.

Socrates:: After these discoveries, let us look if we can meet with pleasures and pains still falser, and more remote from truth, than those already mentioned, which are not only in appearance what they are called, but are felt also by the soul.

Protarchus:: What pleasures and pains do you speak of?

Socrates:: We have more than once said, that when the frame of any animal is on its way to dissolution, through mixtures and separations, repletions and evacuations, the increase of some, and the diminution of other parts of it, that in such a condition of its body, pains, aches, and oppressions, with many other uneasy feelings, to which are given various names, are wont to arise in us.

Protarchus:: True: this observation has been again and again repeated.

Socrates:: And that, when all things in our bodily frame return to their natural and sound state, together with this recovery, we receive some pleasure from within ourselves.

Protarchus:: Right.

Socrates:: But how is it when none of these changes are operating in our bodies?

Protarchus:: At what times, O Socrates, may this be?

Socrates:: The question, O Protarchus, which you have now put to me is nothing to the purpose.

Protarchus:: Why not?

Socrates:: Because it will not hinder me from putting again my question to you.

Protarchus:: Repeat it then.

Socrates:: I shall put it thus: If at any time none of those things were passing within us, what condition should we of necessity be in, as to pleasure and pain, at such a time?

Protarchus:: When no motion was in the body either way, do you mean?

Socrates:: Exactly so.

Protarchus:: It is plain, O Socrates, that we should feel neither any pleasure nor any pain at such a time.

Socrates:: Perfectly well answered. But now in your question I suppose you meant this,—that some or other of those things were of necessity passing within us continually at all times; agreeably to this saying of the wise,—“that all things are in perpetual flow, going upward and downward.”

Protarchus:: So they tell us: and this saying of theirs is, methinks, worthy of regard.

Socrates:: Undoubtedly it is: For it is said by men who are worthy, themselves, to be regarded. But this subject, which we have thus lighted on, I would willingly decline. Now I have it in my thoughts to avoid it this way; but you must accompany me.

Protarchus:: What way?

Socrates:: Be it so, then, let us say to these wise men: but you, Protarchus, answer me to this question: Do animals feel all the alterations which they continually undergo? or, whilst we are growing, or suffering in any part of our bodies any other change, are we sensible of these internal motions? Is not quite the contrary true? for almost every thing of this kind passing within, us passes without our knowledge.

Protarchus:: Certainly so.

Socrates:: It was, therefore, not right in us to say, as we did just now, that all the alterations which happen to our bodies, and all the motions within them produce either pains or pleasures.

Protarchus:: Certainly not right.

Socrates:: And it would be better, and less liable to censure, to lay down this position.

Protarchus:: What position?

Socrates:: That great changes within give us pains and pleasures; but that such as are inconsiderable, or only moderate, produce neither pleasures nor pains.

Protarchus:: This is more justly said than the other sentence, indeed, Socrates.

Socrates:: If, then, these things are so, we meet with the life mentioned before recurring to us here again.

Protarchus:: What life?

Socrates:: That which is exempt from all sensations, both of pain and pleasure.

Protarchus:: Very true.

Socrates:: Hence, we find there are three kinds of life proposed to our consideration: one of them full of pleasure, another full of pain; the third neutral, and free from both. Or how otherwise would you determine upon these points?

Protarchus:: No otherwise I, for my part: for three different kinds of life appear to me in what has been said.

Socrates:: To have no pain, therefore, cannot be the same thing as to have pleasure.

Protarchus:: Certainly it cannot.

Socrates:: But whenever you hear a man say, that it is the most pleasurable of all things to live all one's life free from pain, what do you take to be his thought and meaning?

Protarchus:: He means and thinks, as I take it, that it is a pleasure not to have any pain.

Socrates:: Well now: let there be any three things whatever: to instance in things of honorable name, let us suppose one of them to be gold, another to be silver, and the third to be neither gold nor silver.

Protarchus:: We shall suppose so.

Socrates:: That which is neither, is it possible For it any way to become either gold or silver?

Protarchus:: By no means.

Socrates:: The middle life, therefore, if it were said to be pleasurable, or if it were said to be painful, would not be spoken of in either way, rightly and agreeably to the true nature of things; nor would any person who entertains either of those opinions concerning it think rightly.

Protarchus:: Certainly not.

Socrates:: And yet, my friend, we find that there are persons who actually speak and think thus amiss.

Protarchus:: It is very evident.

Socrates:: Do these persons really feel pleasure whenever they are free from pain?

Protarchus:: So they say.

Socrates:: They must imagine, then, that they are pleased; for otherwise they would not say so.

Protarchus:: They do, it seems, imagine it.

Socrates:: They have a wrong opinion then of pleasure; if it be true that pleasure, and freedom from pain, have each a distinct nature, different from that of the other.

Protarchus:: Different, indeed, we have concluded them to be.

Socrates:: And are we willing to abide by our late conclusion, that the subjects still under examination are three distinct things? or do we choose to say that they are only two? Do we now say that pain is man's evil, and that deliverance from pain is man's good, and is that to which is given the appellation of pleasure?

Protarchus:: How come we, O Socrates, to propose this point to be reconsidered by us now? for I do not apprehend your drift.

Socrates:: In fact, O Protarchus, you do not apprehend who are the direct enemies to Philebus.

Protarchus:: To whom do you give that character?

Socrates:: To persons who are said to have a profound knowledge of nature: these persons say that pleasures have no reality at all.

Protarchus:: What do they mean?

Socrates:: They say that all those things which Philebus and his party call pleasures are but deliverances from pain.

Protarchus:: Is it your advice, then, O Socrates, that we should hearken to these persons? or how otherwise?

Socrates:: Not so: but to consider them as a kind of diviners, who divine not according to any rules of art; but, from the austerity of a certain genius in them not ignoble, have conceived an aversion to the power of Pleasure, and deem nothing in her to be solid; but all her attractive charms to be mere illusions, and not [true] pleasure. It is thus that we should regard these persons, especially if we consider their other harsh maxims. You shall in the next place hear what pleasures seem to me to be true pleasures: so that, from both the accounts compared together, we may find out the nature of Pleasure, and form our judgment of her comparative value.

Protarchus:: Rightly said.

Socrates:: Let us then follow after them as our allies, wherever their austerity shall lead us. For I suppose they would begin their argument with some general principle, and propound to us some such question as this,—whether, if we had a mind to know the nature of any particular quality of things, for instance, the nature of the hard, whether or no we should not comprehend it better by examining the hardest things, than we should by scrutinizing a various multitude of the less hard. Now, Protarchus, you must make an answer to these austere persons, as if you were making it to me.

Protarchus:: By all means: and I make this answer to them.—that to examine such bodies as exceed all others in hardness is the better way.

Socrates:: In like manner, then, if we had a mind to know the nature of pleasure in general, we are not to consider the multitude of little or mean pleasures, but those only which are called extreme and exquisite.

Protarchus:: Every man would grant you the truth of this your present argument.

Socrates:: The pleasures which are always within our reach, those which we often call the greatest, do they not belong to the body?

Protarchus:: There is no doubt of it.

Socrates:: Are the [bodily] pleasures which are produced in those persons who labor under diseases, greater than the pleasures [of the same kind] felt by those who are in health? Now let us take care not to err, by making too precipitate an answer.

Protarchus:: What danger is there of erring?

Socrates:: Perhaps we might pronounce in favor of those who are in health.

Protarchus:: Probably we should.

Socrates:: But what? are not those pleasures the most excessive which are preceded by the strongest desires?

Protarchus:: This cannot be denied.

Socrates:: The afflicted with fevers, or with diseases of kin to fevers, are they not more thirsty than other persons? do they not more shake with cold? and suffer they not in a greater degree other evils which the body is subject to? Do they not feel their wants more pressing? and feel they not greater pleasures when they have those wants supplied? Or shall we deny all this to be true?

Protarchus:: Your representation of those cases clearly is right.

Socrates:: Well then: should we not be clearly right in saying, that whoever would know what pleasures are the greatest must not go to the healthy, but to the sick, to look for them? Be careful now not to imagine the meaning of my question to be this,—whether the sick enjoy pleasures more, in number, than the healthy: but consider me as inquiring into high degrees of pleasure; and by what means, and in what subjects, the vehemence or extreme of it always is produced. For we are to find out, we say, what the nature is of pleasure, and what those persons mean by pleasure who pretend that no such thing as pleasure has any being at all.

Protarchus:: Tolerably well do I apprehend your argument.

Socrates:: And possibly, O Protarchus, you will equally well show the truth of it. For, tell me; in a life of boundless luxury see you not greater pleasures (I do not mean more in number, but more intense and vehement,) than those in the life of temperance? Give your mind to the question first, and then, answer.

Protarchus:: I apprehend what you say: and the great superiority of the pleasures enjoyed in a luxurious life I easily discern. For sober and temperate persons are on all occasions under the restraint of that maxim, now become a proverb, which advises them to avoid the too much of any thing; to which advice they are obedient. But an excess of pleasure, even to madness, possessing the souls of the unwise and intemperate, as it makes them frantic, it makes them conspicuous, and famed for being men of pleasure.

Socrates:: Well said. If this, then, be the case, it is evident that the greatest pleasures, as well as the greatest pains, are produced in a morbid and vicious, disposition of the soul or of the body; and not when they are in their sound and right state.

Protarchus:: Certainly so.

Socrates:: Ought we not then to instance in some of these pleasures, and to consider what circumstances attend them on account of which it is that they are styled the greatest?

Protarchus:: That must be done.

Socrates:: Consider now what circumstance attends the pleasures which are produced in certain maladies.

Protarchus:: In what maladies?

Socrates:: In those of the base or indecent kind;—pleasures, to which the persons whom we termed austere have an utter aversion.

Protarchus:: What pleasures do you mean?

Socrates:: Those which are felt in curing the itch, for instance, by friction; and in other maladies of like kind, such as need no other medicine. Now the sensation thence arising in us, in the name of the Gods, what shall we say of it? Pleasure is it? or shall we term it pain?

Protarchus:: A mixt sort of sensation, O Socrates, seems to arise from this malady, partaking of both pain and pleasure.

Socrates:: It was not, however, for the sake of Philebus that I brought this last subject into our discourse: it was because we should never be able to determine the point now before us, unless we had taken a view of these mixt pleasures, and of others also which depend on these. Let us proceed, therefore, to consider such as have an affinity with them.

Protarchus:: Such, do you mean, as partake of pleasure and pain by means of their commixture?

Socrates:: That is my very meaning. Of these mixt feelings, then, some belong to the body; and in the body are these generated. Others are of the soul; and these have in the soul their residence. We shall find also pleasures mingled with pains, where the soul and the body have, each of them a share. Now these mixtures [though composed of contraries] are, in some cases, termed only pleasures; in other cases, only pains.

Protarchus:: Express yourself more fully.

Socrates:: When a man, whether in a sound or in a decaying state of his body, feels two contrary sensations at the same time; as when, chilled with cold, he is warming himself; or sometimes, when overheated, he is cooling himself; with a view, I suppose, to his enjoying one of those sensations, and to his deliverance from the other: in such cases, what is called the bitter-sweet, through the difficulty met with in driving away the bitter part, causeth a struggle within, and a fierce meeting together of opposite qualities and sensations.

Protarchus:: It is perfectly true, what you have now said.

Socrates:: Are not some of these mixt sensations composed of pain and pleasure in equal proportion? and in others is not one of them predominant?

Protarchus:: Without doubt.

Socrates:: Among those, then, in which there is an overplus of pain, I reckon that of the malady termed the itch, and all other pruriencies and itchings, when nothing more than a slight friction or motion is applied to them such as only dissipates what humors are at the surface, but reaches not the fermentation and turgescence of those humors which lie deep within. In this condition, the diseased often apply heat to the parts which pain them and then the opposite extreme, through impatience, and uncertainty which way to take. Thus they excite inexpressible pleasures first, and then the contrary, in the interior parts, compared with the pains felt in the exterior, which yet are mixed with pleasures, according as the humors are driven outwardly or inwardly. For by violently dispersing the morbific matter where it is collected, and by compelling it together from places where it lies dispersed, pleasures and pains are at once excited, and arise by each other's side.

Protarchus:: Most true.

Socrates:: Now wherever, in any case of this kind, a greater quantity of pleasure is mingled, the smaller quantity of pain creates but a slight uneasiness, no more than what serves to tickle: whilst, on the other hand, the great excess of pleasure spread throughout convulseth the whole frame, and sometimes causeth involuntary motions; operating also every change of color in the countenance, every variety of posture in the limbs, and every different degree of respiration;—and within the soul it energizes in transports, uttered madly in exclamations.

Protarchus:: Entirely so.

Socrates:: Further: a man in such a condition, O my friend! is apt to say of himself, and others are apt to say of him, that he is dying, as it were, through excess of pleasure. From this time for ever after he is wholly intent on pursuing the like pleasures; and the more so, the more he happens to be intemperate, and less under the government of prudence. Thus he calls these pleasures the greatest, and accounts him the happiest of men who spends his whole time, as far as possible, in the enjoyment of them.

Protarchus:: You have described all this, O Socrates, just as it happens to the bulk of mankind, according to their own sense and opinion.

Socrates:: But all this, O Protarchus, relates only to such pleasures mixed with pains as arise solely in the body, in its superficial parts and interior parts alternately. And as to those feelings of the soul which meet with a contrary condition of the body, when pleasure in the one is mixed with pain in the other, so as that both are ingredients in one composition, we spoke of those before; such as a desire of fullness, under a sense of emptiness in the body; when hope administers delight, while the emptiness gives a pain. We did not, indeed, consider them at that time as evidences of the present point; but we now say, that in all those cases (and the number of them is infinite) where the condition of the soul is different from that of the body, a mixture of pain and pleasure happens to be produced.

Protarchus:: You are, I believe, perfectly in the right.

Socrates:: Among the mixtures of pain and pleasure, there is a third kind remaining, yet unmentioned.

Protarchus:: What kind is that?

Socrates:: That where such pleasures and pains as we said arise frequently in the soul, herself by herself, are mixed together.

Protarchus:: In what cases, say we, are these mixtures found?

Socrates:: Anger, fear, and desire, and lamentation, love, emulation, and envy, and all other such passions of the soul herself, do you not suppose them to give pain and uneasiness to the soul?

Protarchus:: I do.

Socrates:: And shall we not find these very passions fraught with wondrous pleasures? In the passions of resentment and anger, do we need to be reminded of what the poet says,—that

——————though resentment raise
Choler, like smoke, in even the prudent breast;

> The luscious honey from its waxen seat
> Distills not half such sweetness.

And do we not remember, in lamentations and desires, the pleasures we have felt mingled with the pains which those passions produce?

Protarchus:: It is true: our passions do affect us in the manner you have mentioned, and no otherwise.

Socrates:: And have you not observed, at tragic spectacles presented on the stage, with how much pleasure the spectators shed tears?

Protarchus:: I certainly have.

Socrates:: But have you attended to the disposition of your soul at the acting of a comedy? Do you know that there also we feel pain mixed with pleasure?

Protarchus:: I do not perfectly well comprehend that.

Socrates:: It is not perfectly easy, O Protarchus, at such a time, to comprehend what mixed passions possess the soul in every case of that kind.

Protarchus:: Not at all easy, I believe.

Socrates:: However, let us consider what our feelings are at that time; and the more attentively, on account of their obscurity; that we may be able to discover with the greater ease what mixture there is of pain and pleasure in other cases.

Protarchus:: Say on, then.

Socrates:: The passion known by the name of envy, will you set it down for a sort of pain in the soul, or how?

Protarchus:: Even so.

Socrates:: And yet the man who envies another will plainly appear to be delighted with the evils which befall him.

Protarchus:: Clearly so.

Socrates:: Now ignorance is an evil; and so is what we term want of sense.

Protarchus:: Undoubtedly.

Socrates:: From these premises you may perceive what is the nature of ridicule and the ridiculous.

Protarchus:: You must tell me what it is.

Socrates:: Every particular vice takes its name from some particular bad habit in the soul. But total viciousness, the habit of wickedness in all respects, is the direct contrary of that habit which the Delphic inscription adviseth us to acquire.

Protarchus:: That of knowing one's self do you mean, O Socrates?

Socrates:: I do. And the contrary to this advice of the oracle would be not to know one's self in any respect at all.

Protarchus:: Certainly it would.

Socrates:: Try now to divide this ignorance of ourselves into three kinds.

Protarchus:: How, say you, should this be done? for I am not able to do it.

Socrates:: Do you say that I should make this division in your stead?

Protarchus:: I not only say it, but desire you so to do.

Socrates:: Well then: whoever is ignorant of himself, must he not be thus ignorant, in one or other of these three respects?

Protarchus:: What three?

Socrates:: First, with respect to external possessions, in imagining himself wealthier than he really is.

Protarchus:: Many persons there are who labor under this sort of ignorance.

Socrates:: Yet more numerous are they, in the next place, who imagine themselves handsomer in their persons, nobler in their air, or graced with some other corporeal advantage in a higher degree than actually they are.

Protarchus:: Very true.

Socrates:: But the number is by far the greatest, I presume, of such as are mistaken in themselves, with respect to the third kind of excellence, that which belongs to the soul, by fancying themselves possessed of more virtue than in truth they have.

Protarchus:: Nothing is more certain.

Socrates:: Among the virtues and excellencies of the soul, is not wisdom that to which the generality of mankind lay claim with the greatest earnestness, and in regard to which they are full of contention, opinionativeness, and false notions?

Protarchus:: Evidently so.

Socrates:: Now the man who should say that ignorance and error, in any of these respects, were evils, would say what is true.

Protarchus:: Very right.

Socrates:: But we are to make still another division of this ignorance of a man’s self, O Protarchus, if we would discover the odd mixture of pain and pleasure in that mirthful envy which is excited by comedy,—a division into two sorts.

Protarchus:: Into what two sorts do you mean?

Socrates:: To those persons who foolishly entertain any such false opinion of themselves it necessarily happens, as it does to all men in general, that strength and power attend on some; while the fate of others is quite the contrary.

Protarchus:: It must be so.

Socrates:: According to this difference then between them distinguish those ignorant persons into two sorts. And all those whose self-ignorance is attended with weakness, and with a want of power to be revenged on such as laugh at them you may justly say that they are open to ridicule, and may call their characters properly ridiculous. But as to the others, who have power to take their revenge, if you should say that these are to be dreaded, as being powerful and hostile, you would give a very right account of them. For such ignorance, armed with power, is powerful to do mischief; and not only itself is hostile and hurtful to all persons within its reach, but so likewise are all its images and representatives. But self-ignorance, without strength and power, is to be ranked among the things which are ridiculous, and is a proper object of ridicule.

Protarchus:: There is much of truth in what you say. But I do not as yet perceive clearly what mixture there is of pain and pleasure in our feelings on such occasions.

Socrates:: You are, in the first place, to apprehend the force of envy in these cases.

Protarchus:: Show it me then.

Socrates:: Is not sorrow, on some occasions, felt unjustly? and is it not the same case with joy and pleasure?

Protarchus:: No doubt can be made of it.

Socrates:: There is neither injustice, nor envy, in rejoicing at the evils which befall our enemies.

Protarchus:: Certainly there is not.

Socrates:: But if at any time, when we see an evil happening to our friends, we feel no sorrow,—if, on the contrary, we rejoice at it,—are we not guilty of injustice?

Protarchus:: Without dispute.

Socrates:: Did we not say that it was an evil to any person to be ignorant of himself?

Protarchus:: We did, and justly too.

Socrates:: If there be in any of our friends a false conceit of their own wisdom, or of their own beauty, or of whatever else we mentioned, when we divided ignorance of one's self into three kinds, is not this conceit an object of ridicule, where it is attended with impotence and weakness; but an object of hatred, if power and strength are joined with it? or do we deny, what I just now said, that the having of such a false opinion, if it be not hurtful to others, is an object of ridicule?

Protarchus:: You said what is entirely true.

Socrates:: And do we not acknowledge this false conceit to be an evil, as being built on ignorance?

Protarchus:: Most heartily.

Socrates:: Whether do we feel delight or sorrow when we laugh at it?

Protarchus:: It is plain that we feel delight.

Socrates:: Did we not say, that whenever we feel delight from the evils which happen to our friends, it is envy which operates in us that unjust delight?

Protarchus:: It must be envy.

Socrates:: Our reasoning then shows, that when we laugh at what is ridiculous in a friend, mixing thus delight with envy, we mix together pleasure and pain. For we acknowledged long ago that envy gives uneasiness and pain to the soul; and we have admitted, that laughing yields delight. Now in these cases they arise, both of them at the same time.

Protarchus:: True.

Socrates:: We see, then, from the conclusion of our argument, that in mournful spectacles, and no less in comedies, not only as they are acted on the stage, but as they are presented to us also in the tragedy and comedy of real life, and in a thousand intermediate occurrences, pains and pleasures are blended together.

Protarchus:: It would be impossible, O Socrates, for a man not to acknowledge this, were he ever so zealous an advocate for the opposite side.

Socrates:: When we entered on the present subject, we proposed to consider anger, desire and grief, fear and love, jealousy and envy, and such other passions of the soul; promising ourselves to find in them those mixed feelings which again and again we had been speaking of: did we not?

Protarchus:: We did.

Socrates:: Do we perceive that we have dispatched already all which relates to grief, and envy, and anger?

Protarchus:: We perceive it clearly.

Socrates:: But there is much yet remaining.

Protarchus:: Very true.

Socrates:: For what reason, principally, do you suppose it was that I explained to you the mixed feeling which a comedy occasions in us? Do you not conceive, that it was to show myself able to explain to you with much more ease, the like mixture of pain and pleasure in fear, in love, and in the other passions? and that after you had seen the truth of it in one instance, you might discharge me from the necessity of proceeding to the rest, or of lengthening out the argument any further; but might receive it for a truth, without limitation or exception, that the body without the soul, and the soul without the body, and both together likewise, are, in many things, which affect them severally or jointly, full of a sense of pleasures mingled with pains. Say, then, whether you will dismiss me, or make it midnight before we finish. But I imagine that, after I shall have added a few things more, I shall obtain from you my dismission: for I shall be ready to give you an account of all these things at large tomorrow; but at present am desirous of proceeding to what remains on this subject; that we may come to a decision of the point in controversy, as Philebus hath enjoined us.

Protarchus:: You have well spoken, O Socrates; and as to what remains, go through with it in whatever way it is agreeable to yourself.

Socrates:: Well then: after the mixed pleasures we are to proceed, by a kind of natural necessity, to the several pleasures which are unmixed and pure.

Protarchus:: Perfectly well said.

Socrates:: The nature of these I shall endeavor to explain to you, by converting to my own use, with a little alteration, what is said of them by others. For I do not entirely give credit to those persons who tell us, that all pleasure consists in a cessation from uneasiness and pain. But, as I said before, I make use of these persons as witnesses, in confirmation of this truth,—that some things there are which seem to be pleasures, but by no means are so in reality; and of this also,—that some other pleasures there are, many and great in imagination, accompanied with pains, but at the same time with relief from greater pains, amid the distresses of the body and of the soul.

Protarchus:: But what pleasures are those, O Socrates, which a man would deem rightly of, in supposing them to be true?

Socrates:: The pleasures which are produced in us from seeing beauteous colors and beauteous figures; many pleasures also of the smell, and many others arising in us from the hearing of sounds; in a word, whatever pleasures we feel from perceiving the presence of any thing, whose absence we are insensible of, or at least occasions no pain in us, all these are unmixed and pure.

Protarchus:: How do you explain this general account, O Socrates?

Socrates:: The meaning of it, indeed, is not directly obvious: but we must endeavor to make it evident. I mean, then, by beauteous figures, not, as most men would suppose I meant, the beauty of living forms, or their statues; but the straight and the round, whether in surfaces, or in solids; according to which are fashioned the turner’s works, and those of the carpenter, by means of his rules and angles. For the figures which I mean, if you apprehend me, have no relative beauty, like those other beauteous forms; but in their own nature, separately considered, are always absolutely beautiful; and the beholding of them gives us certain peculiar pleasures, not at all similar to the pleasures excited in us by any kind of motion. And as to colors, I mean such as bear the like stamp of absolute beauty, and yield also pleasures of a peculiar nature. But do we apprehend these things? or what say we to them?

Protarchus:: I endeavor, O Socrates, to comprehend your full meaning: but endeavor you yourself to explain thoroughly the whole of it.

Socrates:: As to sounds, I mean such as are smooth, clear, and canorous, conveying some pure and simple melody, without relation to any other sounds, but singly of themselves musical: of such I speak, and of the connatural pleasures which attend them.

Protarchus:: That such pleasures also there are, I readily acknowledge.

Socrates:: The pleasures felt by us from certain odors are, indeed, of a kind less divine than the pleasures just now mentioned; but in respect of their being equally pure, and not, of necessity, mixed with pains, I rank them all under the same head. For in whatever pleasures there happens to be found this quality of entire freedom from pain, all these I oppose to those other pleasures with which pain is complicated. Now, if you observe, we have already spoken of two different kinds of pleasure.

Protarchus:: I do observe.

Socrates:: To these let us now add the pleasures taken in the mathematical sciences; unless we are of opinion that such pleasures are of necessity preceded by a thirst of learning them; and that, when tasted and enjoyed, they raise a thirst of more and more; so that, from our beginning to learn them„ they are all along attended with uneasiness.

Protarchus:: I think that such uneasiness is not at all necessary.

Socrates:: Well: but suppose that, having attained to full possession of them, we happen afterwards to lose some part through forgetfulness, do you see no uneasiness arising hence?

Protarchus:: None at all from the nature of the thing itself: but when the knowledge is wanted to be applied to some use in human life, then a man is uneasy at having lost it, on account of its usefulness.

Socrates:: And we are at present, my friend, actually concerned about those feelings only which arise in us from the nature of the knowledge itself, without any regard to the usefulness of it in computing or measuring.

Protarchus:: You are right then in saying, that, in mathematical knowledge, a forgetfulness frequently befalls us, without giving us any uneasiness.

Socrates:: These pleasures, therefore, the pleasures of science, we must acknowledge to be unmixed with pains. But these pleasures belong not to the vulgar multitude, being enjoyed only by a very few.

Protarchus:: All this must certainly be acknowledged.

Socrates:: Now, then, that we have tolerably well distinguished between the pure pleasures and those which are rightly called impure, let us further add these distinctions between them.—that the vehement pleasures know not moderation nor measure; while those of the gentler kind admit of measure, and are moderate: and that greatness and intenseness, and the contrary qualities, the frequency also and the rareness of repetition, are attributes of such pleasures only as belong to the boundless genus,—to that which is perpetually varying in its quantities and motions through the body and through the soul,—while the pleasures to which the like variations never happen, belong to the contrary genus, and are allied to all things wherein symmetry is found.

Protarchus:: Perfectly right, O Socrates.

Socrates:: The pleasures, beside these assortments of them are to be further distinguished thus.

Protarchus:: How?

Socrates:: We should consider whether the purity and the simplicity of pleasures serve to discover what true pleasure is: or whether the truth of pleasures may best be known from their intenseness, their multitude, their greatness and their abundance.

Protarchus:: What is your view, Socrates, in proposing this to be considered?

Socrates:: To omit nothing by which the nature of pleasure, and that of knowledge, may be set in the clearest light; and not to leave it undiscovered, whether or no some kinds of each of them are pure, while other kinds are impure; that thus, what is pure and simple in each being brought before us to be judged of, you and I, and all this company, may the more easily form a right judgment.

Protarchus:: Very rightly said.

Socrates:: Well then: all those kinds of things which we commonly say are pure, let us consider of in the following way: but first let us choose out some one among them for an instance to consider of.

Protarchus:: Which would you have us choose?

Socrates:: Among the principal of those kinds, let us, if you please, consider the white kind of things.

Protarchus:: By all means.

Socrates:: In what way, then, might we have any thing which is called white, with the most perfect and pure whiteness? whether by having the greatest number of things which are white, and the largest of the kind in size, or by having what is white in the highest degree, and not tinged with the least degree of any other color?

Protarchus:: Evidently, by having what is of the most simple and unmixed whiteness.

Socrates:: Rightly said. Shall we not then determine that this pure white is the truest, and at the same time the most beautiful of all whites; and not that which is of the largest size, and whose number is the greatest?

Protarchus:: Most certainly we shall.

Socrates:: In pronouncing, then, that a little of purely white is whiter, and of a more beautiful and true whiteness, than a great quantity of the mixed white, we shall say what is entirely right.

Protarchus:: Without the least doubt.

Socrates:: Well then: I suppose we shall have no occasion to produce many such instances to prove the truth of our conclusion concerning pleasure; the instance already brought seems sufficient for us to perceive at once, that a little of pleasure, pure, and free from pain, is more pleasant, more true, and perfect, as well as more comely, than pleasure where pain is mingled, be there ever so much of it, or be it ever so vast and vehement.

Protarchus:: By all means: the instance you gave in whiteness, is an argument from analogy, sufficient for the proof of it.

Socrates:: But what think you now of this? Have we not heard it said concerning pleasure, that it is a thing always in generation, always produced anew, and having no stability of being, cannot properly be said to be at all? For some ingenious persons there are who endeavor to show us, that such is the nature of pleasure; and we are much obliged to them for this their account of it.

Protarchus:: Why so?

Socrates:: I shall recount to you the whole of their reasoning on this point, my friend Protarchus, by putting a few questions to you.

Protarchus:: Do so: and begin your questions.

Socrates:: Are there not in nature two very different kinds of things: this, in itself alone complete; that, desirous always of the other?

Protarchus:: How do you mean? and what things do you speak of?

Socrates:: One of them is by nature always of high dignity and value; the other, falling far short of it, and always indigent.

Protarchus:: Express yourself a little more clearly.

Socrates:: Have we not seen some of the fair sex who excelled in beauty and in virtue? and have we not seen their lovers and admirers?

Protarchus:: Often.

Socrates:: Analogous then to these two different sorts of persons, see if you cannot discover two different kinds of things, to one or other of which different kinds belongs every thing, commonly said to have a being: the third be to the savior.

Protarchus:: Speak your meaning, O Socrates, in plainer terms.

Socrates:: I mean nothing, O Protarchus, but what is very simple and easy to be seen. But our present argument is pleased to sport itself. However, it means no more than this,—that there is a kind of things which are always for the sake of some other; and there is also a kind of things for whose sake always is produced whatever hath any final cause of its production.

Protarchus:: I find it difficult to understand your meaning, after your many explanations of it.

Socrates:: Perhaps, young man, it will be understood better as we proceed in the reasoning on this subject.

Protarchus:: I make no doubt of it.

Socrates:: Let us now make another division of things into two different kinds.

Protarchus:: What kinds are they?

Socrates:: The generation of all things is one kind of things; and the being of all is a different kind.

Protarchus:: I admit your difference between being and generation.

Socrates:: You are perfectly in the right. Now, whether of these two is for the sake of the other? Shall we say that generation is for the sake of being? or shall we say that being is for the sake of generation?

Protarchus:: Whether or no that which is termed being, is what it is for the sake of generation, is this your present question?

Socrates:: Apparently it is.

Protarchus:: In the name of the Gods, how can you ask so strange a question?

Socrates:: My meaning in that question, O Protarchus, is of such a kind as this other;—whether you would choose to say that ship-building is for the sake of shipping, rather than you would say that shipping is for the sake of ship-building: and all other things of like kind, O Protarchus, I include in the question which I ask you.

Protarchus:: But for what reason, O Socrates, do you not give an answer to it yourself?

Socrates:: I have no reason to refuse that office; do you but go along with me in my answer.

Protarchus:: Certainly I shall.

Socrates:: I say, then, that for the sake of generation, it is true, that medicines are composed; the instrumental parts, prepared by nature, and all the materials of it, provided: but that every act of generation is for the sake of some being; generation in every species, for the sake of some being belonging to that species; and universally, all generation, for the sake of universal being.

Protarchus:: Most evidently so.

Socrates:: If pleasure, then, be of such a nature as to be generated always anew, must not the generating of it be always for the sake only of some being?

Protarchus:: Without doubt.

Socrates:: Now that, for the sake of which is always generated whatever is generated for some end, must be in the rank of things which are good: and that which is generated for the sake of any other thing, must of necessity, my friend, be placed in a different rank of things.

Protarchus:: Certainly it must.

Socrates:: Shall we not be right, then, in placing pleasure in a rank of things different from that of good; if it be true, that pleasure has no stable being, but is always generated anew?

Protarchus:: Perfectly right.

Socrates:: Therefore, as I said in beginning this argumentation, we are much obliged to the persons who have given us this account of pleasure,—that the essence of it consists in being always generated anew, but that never has it any kind of being. For it is plain, that these persons would laugh at a man who asserted, that pleasure and good were the same thing.

Protarchus:: Certainly they would.

Socrates:: And these very persons would certainly laugh at those men, wherever they met with them who place their chief good and end in generation.

Protarchus:: How, and what sort of men do you mean?

Socrates:: Such, as in freeing themselves from hunger, or thirst, or any of the uneasinesses from which they are freed by generation, are so highly delighted with the action of removing those uneasinesses, as to declare they would not choose to live without suffering thirst and hunger, nor without feeling all those other sensations which may be said to follow from such kinds of uneasiness.

Protarchus:: Such, indeed, there are, who seem to be of that opinion.

Socrates:: Would not all of us say that corruption was the contrary of generation?

Protarchus:: It is impossible to think otherwise.

Socrates:: Whoever, then, makes such a life his choice, must choose both corruption and generation, rather than that third kind of life, in which he might live with the clearest discernment of what is right and good, but without the feeling of either pain or pleasure.

Protarchus:: Much absurdity, as it seems, O Socrates, is to be admitted by the man who holds that human good consists wholly in pleasure.

Socrates:: Much, indeed. For let us argue further thus.

Protarchus:: How?

Socrates:: Since no good nor beauty is in bodies, nor in any other things beside the soul; is it not absurd to imagine, that in the soul pleasure should be the only good; and that neither fortitude, nor temperance, nor understanding, nor any of the other valuable attainments of the soul, should be numbered among the good things which the soul enjoys? Further too, is it not highly irrational to suppose, that a man afflicted with pain, without feeling any pleasure, should be obliged to say that evil only, and no good, was with him at the time when he was in pain, though he were the best of all men? And is it not equally absurd, on the other hand, to suppose that a man in the midst of pleasures must be, during that time, in the midst of good; and that the more pleasure he feels, the more good he is filled with, and is so much the better man?

Protarchus:: All these suppositions, O Socrates, are absurdities in the highest degree possible.

Socrates:: It is well. But now let us not employ ourselves wholly in searching into the nature of pleasure; as if we industriously declined the examination of intellect and science; but in these also, if there be any thing putrid or unsound, let us have the courage to cut it all off, and throw it aside; till, coming to a discovery of what is entirely pure and sound therein, the discovery may be of use to us in comparing the truest parts of intellect and science with the truest parts of pleasure, and in forming our judgment concerning the superiority of either from that comparison.

Protarchus:: Rightly said.

Socrates:: Do we not hold, that mathematical science is partly employed in the service of the mechanic arts, and partly in the liberal education and discipline of youth? or how think we on this subject?

Protarchus:: Exactly so.

Socrates:: Now, as to the manual arts, let us consider, in the first place, whether some of these depend not on science more than others; and whether we ought not to look on those of the former sort as the more pure, and on these others as the more impure.

Protarchus:: Certainly we ought.

Socrates:: And in each of these we should distinguish and separate the leading arts from the arts which are led and governed by them.

Protarchus:: What arts do you call the leading arts? and why do you give that epithet to them?

Socrates:: I mean thus: from all the arts were a man to separate and say aside those of numbering, of measuring, and of weighing, what remained in every one of them would became comparatively mean and contemptible.

Protarchus:: Contemptible, indeed.

Socrates:: For room would be then left only for conjecture, and for exercise of the senses, by experience and habitual practice; and we should then make use of no other faculties beside those of guessing and aiming well, (to which, indeed, the multitude give the name of arts) increasing the strength of those faculties by dint of assiduity and labor.

Protarchus:: All which you have now said must, of necessity, be true.

Socrates:: The truth of it is evident in all musical performances throughout. For, in the first place, harmony is produced, and one sound is adapted to another, not by measuring but by that aiming well which arises from constant exercise. It is evident too in musical performances on all wind-instruments: for in these the breath, by being well aimed as it is blown along, searches and attains the measure of every chord beaten. So that music has in it much of the uncertain, and but a little of the fixed and firm.

Protarchus:: Very true.

Socrates:: And we shall find the case to be the same in the arts of medicine and agriculture, in the art of navigation also, and the military art.

Protarchus:: Most clearly so.

Socrates:: But in the art of building we shall find, as I presume, many measures made use of, and many instruments employed; by which it is made to surpass in accuracy many things which are called sciences.

Protarchus:: How so?

Socrates:: It is so in ship-building, and house-building, and in many other works of carpentry. For in these, I think, the art useth the straight-rule, and the square, the turning-lath and the compasses, the plummet and the marking-line.

Protarchus:: You are entirely right, O Socrates: it is so as you say.

Socrates:: The arts, therefore, as they are called, let us now distinguish into two sorts;—those which music is at the head of, as they are less accurate than? some others; and these others which partake of accuracy the most, at the head of which is architecture.

Protarchus:: This distinction is allowed of.

Socrates:: And let us set down those arts for the most accurate which we lately said were the prime or leading arts.

Protarchus:: You mean, if I mistake not, arithmetic, and those other arts which you mentioned together with it but just now.

Socrates:: The very same. But, O Protarchus, must we not say that each of these arts is two-fold? or how otherwise?

Protarchus:: What arts do you speak of?

Socrates:: Arithmetic, in the first place. Must we not say of this, that the arithmetic of the multitude is of one sort, and that the arithmetic of those who apply themselves to philosophy is of another sort?

Protarchus:: What is the difference by which the one may be distinguished from the other?

Socrates:: The difference between them O Protarchus, is far from being inconsiderable. For the multitude in numbering, number by unequal ones put together; as two armies of unequal force; two oxen of unequal size; two things, the smallest of all,—or two, the greatest,—being compared with others of the same kind. But the students in philosophy would not understand what a man meant, who, in numbering, made any difference between some and other of the ones which composed the number.

Protarchus:: You are perfectly right in saying that no inconsiderable difference lies in the different manner of studying and using numbers; so as to make it probable that two different sorts there are of arithmetic.

Socrates:: Well: and what of calculation in trade, and of mensuration in building? Does the latter of these arts not differ from mathematical geometry? nor the other from calculations made by the students in pure mathematics. Shall we say that they are, each of them but one art? or shall we set down each of them for two?

Protarchus:: For my part, I should give my opinion agreeably to your division of arithmetic; and should say that each of these arts also was two-fold.

Socrates:: You would give a right opinion. But with what design I brought these distinctions on the carpet do you conceive?

Protarchus:: Perhaps I do. But I could wish that you yourself would declare what was your design.

Socrates:: These distinctions seem to me to have shown to us, that in science there is that very circumstance attending it which we had before discovered to be in pleasure; the one thus answering to the other. For, having found that some sort of pleasure was purer than some other sort, we were inquiring whether the same difference was to be found with regard to science; and whether one sort of this also was purer than some other.

Protarchus:: It is very manifest that your distinctions between the several arts were introduced for this very purpose.

Socrates:: Well then: have we not discovered, in what has been said, that some arts are clearer than others, having more light within them; and that others are more involved in obscurity and darkness?

Protarchus:: Evidently so.

Socrates:: And has not the course of our argument led us to take notice of some art, bearing the same name with some other art; and first, to suppose them both to be, as they are commonly imagined, but one art; then, to consider them as two different arts; to examine each with regard to its clearness and purity; and to inquire which of the two has in it the most accuracy, whether that which is cultivated by students in philosophy, or that which is exercised by the multitude?

Protarchus:: Our argument seems to bring on this inquiry.

Socrates:: And what answer, O Protarchus, should we make to such a question?

Protarchus:: O Socrates, we are now advanced so far as to discover an amazingly wide difference between the parts of our knowledge in point of clearness.

Socrates:: It will, therefore, be the easier for us to answer to that question.

Protarchus:: Without doubt. And let us affirm, that those leading arts greatly excel the others with regard to clearness; and that such of those brighter arts themselves as are studied by real students in philosophy, display, in measures and in numbers, their vast superiority to all other arts, with regard to accuracy and truth.

Socrates:: Granting these things to be what you say they are, let us, on the credit of what you have said, boldly answer to those persons who are so formidable in argumentation, thus:

Protarchus:: How?

Socrates:: That there are two sorts of arithmetic; and that, dependant on these, there is a long train of arts, each of them in like manner, two-fold under one denomination.

Protarchus:: Let us give to the persons whom you call formidable that very answer, O Socrates, with a confidence of its being right.

Socrates:: Do we then affirm, that in these sciences there is an accuracy thee highest of all.

Protarchus:: Certainly.

Socrates:: But the power of dialectic, O Protarchus, if we gave to any other science the preference above her, would deny that superiority.

Protarchus:: What power is it to which we are to give that name?

Socrates:: Plainly that power, O Protarchus, by which the mind perceives all that accuracy and clearness of which we have been speaking. For I am entirely of opinion, that all persons, endued with even the smallest portion of understanding, must deem the knowledge of the real essence of things—the knowledge of that kind of being whose nature is invariable—to be by far the most certain and true knowledge. But you, Protarchus, to what Art or science would you give the distinction of preeminence?

Protarchus:: As to me, O Socrates, I have often heard Gorgias maintaining in all places, that the art of persuasion has greatly the advantage over all other arts in overruling all things, and making all persons submit to it, not by constraint, but by a voluntary yielding; and therefore, that of all arts it is by far the most excellent. Now I should not choose to contradict, or oppose either you or him.

Socrates:: As much as to say, if I apprehend your meaning rightly, that you cannot for shame desert your colors.

Protarchus:: Let your opinion of these matters now prevail; and the ranks of the several arts be settled as you would have them.

Socrates:: Am I now to blame for your making a mistake?

Protarchus:: What mistake have I made?

Socrates:: The question, my friend Protarchus, was not which art, or which science, is superior to all the rest, with regard to greatness, and excellence, and usefulness to us; but of which art the objects are the brightest, the most accurate, and true, though the art itself brought us little or no gain: this it is, which is the present subject of our inquiry. Observe, then, Gorgias will have no quarrel with you: for you may still allow to his art the preference above all others, in point of utility and profit to mankind. But, as I said before concerning white, that be there ever so little of it, so it be pure, it excels a large quantity of an impure white, with regard to the truth of whiteness; just so is it with the study which I have been commending; it excels all others with regard to truth itself. And now that we have considered this subject attentively, and discussed it sufficiently, laying aside all regards to the usefulness of the sciences and arts, as well as to the reputation which they bear in the world, and thoroughly sifting them to find out the purity of intellect and wisdom,—if there be in the soul any faculty of loving truth above all things, and of doing whatever she does for the sake of truth,—let us consider whether it is right to say that we have this faculty improved chiefly by dialectic, or whether we must search for some other art fitter for that purpose, and making it more her proper business.

Protarchus:: Well: I do consider the point proposed; and I imagine it no easy matter to admit that any other science or art seeks and embraces truth so much as this.

Socrates:: Say you this from having observed that many of the arts, even such as profess a laborious inquiry after truth, are, in the first place, conversant only with opinions, and exercise only the imagination; and that methodically, and according to a set of rules, they then search into things which are the subjects only of such opinions? and do you know, that the persons who suppose themselves to be inquiring into the nature of things are, all their lives, inquisitive about nothing more than this outward world, how it was produced, what causeth the changes which happen therein, and how those changes operate their effects? Should we acknowledge all this so to be, or how otherwise?

Protarchus:: Just so.

Socrates:: Whoever of us then addicts himself to the study of nature in this way, employs his time and care, not about the things which always are in being, but about things which are either newly come into being, or which are to come, or which have been already, and are past.

Protarchus:: Very true.

Socrates:: What clearness, therefore, what certainty, or exact truth, can we expect to find in these things, none of which had ever any stability or sameness in them nor ever will have any, nor have such of them as now exist any, even during their existence?

Protarchus:: How can it be expected?

Socrates:: Concerning things in which there is not the least stability, how can we form any stable notions?

Protarchus:: I suppose it not possible.

Socrates:: Of those things, then, there is neither intelligence, nor any sort of science to be acquired; at least not such as contains the highest degree of certainty.

Protarchus:: It is not probable that there is.

Socrates:: We ought, therefore, both you and I, to lay aside the consideration of what Gorgias or Philebus said, and to establish on a firmer basis this truth.

Protarchus:: What truth?

Socrates:: This:—Whatever is in us of stable, pure, and true, it has for the objects of it—either the beings which always are, and remain invariable, entirely pure and unadulterate; or [if these are beyond the reach of our sight] then such as are the nearest allied to them and are second in the ranks of being: for all other things come after those first beings; second, and so on in order.

Protarchus:: Perfectly right.

Socrates:: The noblest, therefore, of the names given to things of this kind, is it not perfectly right to assign to those of this kind, which are the noblest?

Protarchus:: It is reasonable so to do.

Socrates:: Are not intellect and wisdom the noblest of those names?

Protarchus:: They are.

Socrates:: Rightly then are these names in accurate speech appropriated to the intelligence and contemplation of real being.

Protarchus:: Certainly so.

Socrates:: And the things for the excellency of which I at the first contended, are the very things to which we give these names.

Protarchus:: Clearly are they, O Socrates.

Socrates:: Well now: were a man to say that the nature of intellect and the nature of pleasure lay severally before us, like two different sorts of materials before some workman, for him to mix or join together, and from them and in them to compose his designed work,—would he not make a fair comparison suitable to the task which our inquiry has engaged us in?

Protarchus:: A very fair comparison.

Socrates:: Should we not, then, in the next place, set about mixing them together?

Protarchus:: Why should we not?

Socrates:: Would it not be our best way to begin this work by recollecting and repeating those things over again?

Protarchus:: What things?

Socrates:: Those we have often mentioned before. For, I think, the proverb says well:—“Again and again that which is right, by repeating it, to recall into our minds.”

Protarchus:: Undoubtedly.

Socrates:: In the name of Jupiter, then, come on. The whole of our controversy began, I think, with stating the point in question, to this effect.

Protarchus:: How?

Socrates:: Philebus affirms that pleasure is the right mark set up by nature for all animals to aim at; that they all ought to pursue pleasure; that the good of them all is this very thing, pleasure; and that good and pleasant, these two attributes, belong but to one subject, as they both have but one and the same nature: on the other hand, Socrates denies this to be true; and maintains, in the first place, that as the two names, good and pleasant, are two different names, different also are the things so denominated; in the next place, that the nature of good differs from that of pleasure; and that intelligence, or mind, partakes of the properties of good more than pleasure does, and is allied nearer to its nature. Were not some such positions as these, O Protarchus, severally laid down by us?

Protarchus:: They were.

Socrates:: But was not this point agreed on between us at that time, and do we not still agree in it?

Protarchus:: What point?

Socrates:: That the nature of good itself is more excellent than the nature of any other thing in this respect?

Protarchus:: In what respect?

Socrates:: This: that whatever animal being hath the constant, entire, and full possession of good itself, such a being has no want of any thing beside, having always a most perfect and complete sufficiency. Is it not so?

Protarchus:: It certainly is.

Socrates:: Have we not endeavored to consider separately a life of pleasure and a life of intellect, each unmixed with the other,—a life of pleasure without intellect, and in like manner, a life of intellect without the smallest degree of pleasure?

Protarchus:: We have.

Socrates:: Did either of those lives appear to us at that time to be sufficient for the happiness of any man?

Protarchus:: How was it possible?

Socrates:: But if at that time any mistake was committed, let it be now revised and rectified. In order to which, let us take memory, science, wisdom, and right opinion, comprehending them all in one idea, and consider whether any man, without having something of that kind, would accept of pleasure, were it offered to him, either in the greatest abundance, or in the most exquisite degree; whether, indeed, he would regard the having or the receiving of any thing whatever; as he would not, in that case, have a right thought or opinion of his having any pleasure; neither would he know what he felt or had at present; nor would he remember in what condition or circumstances he had been at any time before. In like manner concerning wisdom, consider, whether a man would choose to have it without a mixture of any pleasure in the least, rather than to have the same wisdom attended with pleasures of certain kinds; and whether a man would prefer the having of all possible pleasures, without wisdom, to the having of them accompanied with some portion of wisdom.

Protarchus:: It is impossible, O Socrates, for a man to make any such choice as you have supposed. And there is no occasion to repeat these questions again and again.

Socrates:: Not pleasure, then, nor wisdom, either of them alone, can be the perfect and consummate good, eligible to all men, that which we are inquiring after.

Protarchus:: Certainly not.

Socrates:: Of this good, then, we are to give a clear and full description, or at least some sketch, that we may know where the second prize of excellence, as we called it, ought to be bestowed.

Protarchus:: Perfectly right.

Socrates:: Have we not, then, taken a way by which we may find out our chief good?

Protarchus:: What way do you mean?

Socrates:: As if we were in search of any particular man, and were already well informed of the place of his abode, we should have made a great progress toward finding the man himself.

Protarchus:: Without doubt.

Socrates:: And our reasoning has now declared to us clearly, what it pointed to before, that, not in the unmixed life, but in the mixed, we are to seek for happiness.

Protarchus:: Certainly so.

Socrates:: But in a proper and well-tempered mixture we may reasonably hope to discover what we are in search of with more certainty than we could by an ill-made composition.

Protarchus:: With much more.

Socrates:: Let us, then, set about mixing and making the composition, first praying to the Gods for their assistance; whether it be Bacchus, or Vulcan, or some other of the Gods, who presides over the mixture of these ingredients.

Protarchus:: Let us, by all means, do so.

Socrates:: And now, as it were, two cisterns, or vases, are set before us; the vase of pleasure, as of honey; and the vase of intellect, cool and sober, as of some hard and healthful water. These, then, we are to mix together in the best manner we are able.

Protarchus:: With all my heart.

Socrates:: Come, then: but first say, whether by mingling all pleasure with all wisdom we may best obtain our end, the having of a proper and due mixture.

Protarchus:: Perhaps we might.

Socrates:: But it is dangerous to make the experiment. And I believe that I can point out a way to mix them with more safety.

Protarchus:: Say what way.

Socrates:: Concerning pleasures, I think, we held, that some more truly deserved that name than others of them; and of arts, that some were more accurate and exact than others.

Protarchus:: Undoubtedly so.

Socrates:: And that the sciences also differed one from another in like manner: for that some kinds of science have for their objects only such things as arise into being and afterwards perish; whereas another kind directs its view to things which are neither generated nor destroyed, but always are in being, always have the same properties, and preserve always the same relations. And this kind of science, with regard to the truth of it, we deemed more excellent than the other kinds.

Protarchus:: Entirely right.

Socrates:: In the first place, therefore, mixing together the purest parts of pleasure and of wisdom, when they have been thus distinguished from the less pure, if we view those purest parts of each in combination, are they not, thus combined, sufficient to furnish out, and present us with, an ample view of that life which is desirable? or is any thing further, any ingredient of a different kind, wanting to perfect the composition?

Protarchus:: So as you propose, and only so, it seems to me necessary for us to do.

Socrates:: Let us, then, suppose a man to have in his mind the idea of justice itself, so as to know what it is in its own essence, and to be able to give an account of it in consequence of that knowledge. Let us also suppose him to have the like knowledge of all other beings.

Protarchus:: Be such a man supposed.

Socrates:: Will this man now sufficiently possess science by knowing the nature of the circle, and of the divine sphere itself; whilst he is ignorant of that sphere, and of those circles with which the eyes of men are conversant? Will that knowledge of his be sufficient for his use in building, and in other arts where lines and circles are to be drawn?

Protarchus:: Ridiculous we should call our condition here, O Socrates, if our knowledge were thus confined to things ideal and divine.

Socrates:: How do you say? Arts which are neither certain nor pure, using untrue rules, and conversant with untrue circles, are we to throw such arts into the composition, and mix them with the other ingredients?

Protarchus:: It is necessary for us; if, whenever we are any where abroad, we are desirous of finding our way home.

Socrates:: Are we to add music too?—an art which, not long since we said, is wanting in purity, as being full of conjecture and imitation?

Protarchus:: Of necessity we must, as it appears to me, if the life which we are to lead shall ever deserve to be called life, or be at all worth the having.

Socrates:: Would you, then, like a doorkeeper, when he is pushed and pressed by a throng of people, yield to them set the doors wide open, and suffer all the sciences to rush in, the less pure mingling themselves among the perfectly pure?

Protarchus:: I see not, O Socrates, for my part, how any man would be hurt by receiving all the other sciences, if he was already in possession of the firsts and highest.

Socrates:: I may safely then admit them all to come pouring in, like the torrents of water in that fine poetical simile of Homer’s, rushing down into a valley from the mountains which surround it.

Protarchus:: By all means, let them be all admitted.

Socrates:: Let us now return to the vase of pleasure. For when we thought of mixing pleasure and knowledge together, the purer parts of pleasure did not present themselves immediately to our minds: but, from our affectionate regard to science, we suffered all kinds of it to crowd in before any of the pleasures.

Protarchus:: Very true.

Socrates:: It is now time for us to consult about the pleasures; whether we should let them all come thronging in, or whether we should admit those of the true sort first.

Protarchus:: It makes a great difference in point of safety, to let in, the first, such only as are true.

Socrates:: Let these, then, be admitted. But how shall we proceed? Must we not do, as we did with the several kinds of science, admit as many pleasures also as are of the necessary sort?

Protarchus:: Without doubt, the necessary pleasures also, by all means.

Socrates:: But now, as we held it both base and advantageous in going through life to be acquainted with every art,—if we are of the same opinion with regard to pleasures,—if we hold it conducive to our good, and at the same time harmless, to enjoy every sort of pleasure in the course of our lives,—in this case, we are to intermix all sorts of pleasure with all the kinds of science.

Protarchus:: What say we then as to this point? and how ought we to act?

Socrates:: This question, O Protarchus, should not be put to us. But the pleasures themselves, and the other assembly also, that of the sciences and arts, are to be examined, each party concerning the other, in this manner.

Protarchus:: In what manner?

Socrates:: Friends, we shall say, [addressing our question to the pleasures first] whether we ought to call you pleasures, or whatever is your right name, would ye choose to live in the same place with all kinds of wisdom, or to live without wisdom? To this interrogatory they must, I think, answer thus:

Protarchus:: How?

Socrates:: That seeing, as was said before, were wisdom and pleasure to be left, each of them alone, single, and destitute of aid, neither of them would have any virtue or power at all, nor would any advantage arise from either,—we deem it best that all the kinds of wisdom should dwell with us, one kind of wisdom with each of us, one who is suitable to the peculiar nature of its companion, and is perfectly acquainted with her power and influence.

Protarchus:: And well have ye now answered, we shall say to them.

Socrates:: After this, we are to demand of wisdom and intellect, in the same manner, thus:—Have ye any occasion for pleasures to be mixed among you? On the other side, we may suppose wisdom and intellect to interrogate us; and what sort of pleasures, they would perhaps say, is it that ye mean?

Protarchus:: Probably they would.

Socrates:: And to this question of theirs our answer would be this:—Beside those true pleasures, we should say, do ye further want the pleasures of the intense and exquisite kind to dwell with you? How is it possible, O Socrates, they would then perhaps say, that we should want these? These, who give a thousand hindrances to all our proceedings; and who, by their fury and madness, are always creating disturbance in the souls where we dwell;—those, who had they been there first, would never have suffered us to have admittance; and who entirely spoil our children, there born, by letting forgetfulness in upon them for want of care to guard the dwelling-place. But the other pleasures mentioned by you, the true and the pure, you are to know that they are nearly related to us, and belong to our family: and beside these, the pleasures who are accompanied by health and sobriety; such, also, as are the followers of all virtue, like the train of some Goddess, every where attending her; let all of these come and mix amongst us. But those pleasures who are always found in company with folly, and with all kinds of vice, it is very absurd for a man to mingle with intellect,—if he desires to see a mixture as clear, untroubled, and well-attempered as possible to be made;—and if he would from thence try to discover what the nature is of good, not only in man, but also in the universe; from which discovery some notion is to be gained, by a sort of divination, of what the idea is of good itself. Shall we not say that intellect and science, in thus answering, have spoken prudently and confidently with themselves, pleading in their own cause, and at the same time in behalf of memory and right opinion?

Protarchus:: By all means ought we.

Socrates:: But in our mixture it is necessary to add this also; for without it no one thing could ever be.

Protarchus:: What is that?

Socrates:: Whatever has not truth mixed with it in the composing of it, can never be produced into true existence; or, could it be produced, it never can be lasting.

Protarchus:: How is it possible that it should?

Socrates:: Certainly no way. Now if any thing further be yet wanting to perfect our composition, declare it, you and Philebus. For the mixture which we have now made in speculation, appears to me to have been as perfectly well composed as if it were some incorporeal world meant for the good government of an animated body.

Protarchus:: And be assured, O Socrates, that to me it has had the same appearance.

Socrates:: Might we not, then, rightly say, that we were now arrived at the dwelling-place of the good, and were standing in its vestibules?

Protarchus:: I think we might.

Socrates:: And now what should we deem to be the greatest excellence in the composition, and to be also the chief cause that such a mixture must be grateful to all? For when we shall have discerned what this is which is so grateful and so excellent, we shall then consider to which of the two, to pleasure or to intellect, it is related the most nearly, and familiar the most intimately, in the constitution of the universe.

Protarchus:: Right: it will be of the greatest service to us in determining this point.

Socrates:: And there is, indeed, no difficulty in discovering the cause, why some mixtures are most valuable, and others good for nothing.

Protarchus:: Explain your meaning.

Socrates:: No person is ignorant of this.

Protarchus:: Of what?

Socrates:: That in every mixture, whatever it be, and whatever be the quantity of it, if measure pervades it not, and if thence it obtains not symmetry and proportion, alt the ingredients must of necessity be spoiled, besides the spoiling of the whole composition. For, in such a case, no one thing is really tempered by any other thing; but a confused and disorderly assemblage is made of various things jumbled together; which, like a concurrence of bad accidents in life, is a real misfortune to the persons who are to use it.

Protarchus:: It is very true.

Socrates:: The power of the good then is transferred, we find, into that province where dwells the nature of the beautiful. For every where, from measure and mediocrity, and from symmetry and proportion, arise beauty and virtue.

Protarchus:: Certainly so.

Socrates:: And we said before that truth also was an ingredient in the composition.

Protarchus:: We did.

Socrates:: If, then, we are not able to discover the nature of good itself in one single idea,—yet, taking it in three ideas together, in beauty, symmetry, and truth, we may conceive it as one thing; and most justly attributing to it the cause of whatever is graceful or agreeable in the composition, we may most truly say, that by means of this, as being good itself, the whole proves to be such as it is, thus agreeable, and thus graceful.

Protarchus:: Most truly, indeed.

Socrates:: Now then, O Protarchus, any person may be a competent judge between pleasure and wisdom to decide, whether of the two is nearest allied to the supreme good, and of higher value than the other is, both to men and Gods.

Protarchus:: What the decision must be is clear. However, it is the better way to go through the recital of it in explicit words.

Socrates:: Each of those three, then, let us compare, severally, with pleasure, and again with intellect. For we are to see and determine whether of these two it is that each of those three is most congenial to, and to give sentence accordingly.

Protarchus:: Do you speak of beauty, and truth, and mediocrity?

Socrates:: I do. Now take, in the first place, O Protarchus, truth; and look at all the three together, intellect, truth, and pleasure: and after you have considered them a sufficient time, say whether, in your opinion, intellect, or whether pleasure, is nearer of kin to truth.

Protarchus:: What need is there of time to consider of this point? for, I presume, that very great is the difference between intellect and pleasure in this respect. Of all things in the world, pleasure is the most addicted to lying: and it is said, that in the pleasures of Venus, which seem to be the greatest, even perjury is pardoned by the Gods; it being supposed that pleasures, like children, have not the least intellect in them to know what they say. But intellect is either the same thing with truth, or it is of all things the most like to it, and the truest.

Socrates:: Next, then, consider mediocrity in the same manner; and say whether you think that pleasure possesses more of it than wisdom, or that wisdom possesses more of it than pleasure.

Protarchus:: This which you have now proposed for a subject of consideration is not less easy than the other. For there cannot, in my opinion, be found any thing more immoderate in its nature than pleasure and extravagant joy; nor any thing which has more of measure in it than intellect and science.

Socrates:: You have well said. But proceed further now to the third. Do you say that intellect partakes of beauty more than any species of pleasure partakes of it? and that intellect is more excellent than pleasure in this respect? or that the contrary is true?

Protarchus:: Did ever any man then, O Socrates, whether awake or dreaming, see or imagine wisdom and intellect, to be in any matter, or in any manner, unhandsome or unbecoming, whether in respecting on the past, or in perceiving the present, or in looking forward to the future?

Socrates:: Right.

Protarchus:: But whenever we see any person immersed in pleasures, in those pleasures too which are of all perhaps the greatest,—when we behold what a ridiculous figure the man makes in the very act of enjoying them.—or view what is of all spectacles the most unseemly, the consequence of his enjoyment,—we ourselves are ashamed; and all such things, as far as possible, we conceal, veiling them with night and darkness, as not being fit objects for the light to look on.

Socrates:: Every where then, O Protarchus, you will declare, speaking yourself to all persons about you, and publishing abroad by messengers, that the possession of pleasure is neither of supreme nor of secondary worth: but that whatever is of all things the most excellent and valuable, is to be found in measure, in the moderate, and the seasonable, and in all things of that kind, whose nature and essence we ought to deem eternal.

Protarchus:: Their supreme excellence appears from what has been said and proved.

Socrates:: And that the next in value are symmetry and beauty, the perfect and the sufficient, and whatever else is congenial to these.

Protarchus:: So it seems.

Socrates:: In the third degree of excellence, if I divine aright, you would not greatly mistake the truth if you were to place intellect and wisdom.

Protarchus:: Perhaps I should not.

Socrates:: And is not the fourth rank due to those things which we assigned to the soul herself, as her own proper goods, sciences, and arts, and right opinions, a fourth order of goods, following next after the first three? ought we not here to place them if they are more nearly related to the good than they are to pleasure?

Protarchus:: Perhaps we ought.

Socrates:: Then follow, fifth in order, the pleasures of that sort which we described to be unmixed with pain, and denominated pure, such as those consequent to sensation, but belonging to the soul herself when she is engaged in the sciences.

Protarchus:: It may be so.

Socrates::

> With the sixth race——(says Orpheus)
> Close we the finish'd series of our song.

Our disquisition, too, seems to be now finished, and to close with passing our sixth sentence. After all this, nothing remains for us to do but to affix a head, as it were, to the whole body of our inquiry.

Protarchus:: It is fit that we should.

Socrates:: Come, then: the third to the savior. Let us commemorate him whose aid brought the argument to a conclusion; calling him to witness the truth of it.

Protarchus:: Whom do you mean?

Socrates:: Philebus laid down this position: that the good was all and every kind of pleasure in full abundance.

Protarchus:: By commemorating the savior, it seems then, Socrates, you meant that we should resume the original argument of our inquiry.

Socrates:: Well: but let us observe what followed. I, viewing with dislike that position just now mentioned,—the tenet, not of Philebus only, but of thousands beside in all ages,—on the other hand asserted, that intellect was a thing far better and more beneficial to human life than pleasure.

Protarchus:: That was your position.

Socrates:: But then, suspecting that many other things had pretentions to the same character of being the good, I engaged, if something should appear better than both of those, to combat for the second prize, in behalf of intellect against pleasure; that pleasure, in her claim to so much as this, might be defeated.

Protarchus:: You did engage so to do.

Socrates:: Afterwards, on trial, it was very sufficiently proved that neither of our favorites answered the character of complete good.

Protarchus:: Perfectly true.

Socrates:: Intellect, therefore, and pleasure, were, both of them quite dismissed from having any thing to do in the controversy concerning good itself; as each of them wanted self-sufficience, and that power which attends the sufficient and perfect.

Protarchus:: Very right.

Socrates:: But after we had discovered a third thing preferable to either of those two, we found the nature of intellect to approach nearer to the nature of this conqueror, and to be much more familiar with this form than pleasure.

Protarchus:: We certainly did.

Socrates:: The sixth and lowest place, then, according to the judgment now given as the result of this inquiry, belongs to the power of pleasure unbounded.

Protarchus:: So it appears.

Socrates:: But the first place belongs to her, as bulls would say, and horses, and all beasts whatever of the savage kind: For it appears so from the manner in which they pursue pleasure. And on the credit of these animals, just as the judgment of diviners depends on the flight of birds, sentence is pronounced by the multitude, that pleasures have the greatest power in making our lives happy. For the loves and joys of brute animals they deem a stronger evidence, and fitter to be credited, than the sayings of men prophetically uttered in all places though inspiration of the philosophic muse.

Protarchus:: That you have said what is most agreeable to truth, O Socrates, we are, all of us, now agreed.

Socrates:: Now then ye will dismiss me.

Protarchus:: There is a little, O Socrates, still remaining to be considered. For you must not quit the company before it breaks up: and I will put you in mind of what you have left unsaid.

THE END OF THE PHILEBUS.

# Sisyphus.

Translated by George Burges, M. A.

## UPON TAKING COUNSEL.

PERSONS OF THE DIALOGUE.

Socrates and Sisyphus.

Socrates:: And we too waited a long time for you yesterday, Sisyphus, at the display made by Stratonicus, in order that you might, together with us, hear a clever man, who both by word and deed exhibited many and beautiful things; and when we thought you would no longer be present, we were by ourselves the hearers of the man.

Sisyphus:: Truly by Zeus. For a want of leisure of rather a compulsory kind occurred to me, so that I neglected the display. For our rulers had a consultation yesterday, and they compelled me to consult with them. Now with us Pharsalians it is a law to obey the rulers, should they order any of us to consult with them.

Socrates:: And honorable it is to obey the law and to be reputed by fellow-citizens to be a good counsellor, as you are reputed to be a good counsellor as one of the Pharsalians. But, Sisyphus, although I should not be able to enter upon a discussion against you on the subject of consulting correctly, conceiving it to be a work requiring much leisure, and a lengthy argument, still I would endeavor to converse with you first about consulting in the abstract, what it is. Can you then tell me what it is to consult in the abstract? Do not tell me what it is to do so well or ill or in any manner, but what kind of thing it is alone by itself. For you could well and easily tell, being so good a counsellor. But I fear lest it is a superfluous work for me to make of you the inquiry.

Sisyphus:: Is it then unknown to you what it is to consult?

Socrates:: It is, Sisyphus, to myself at least, if it be any thing else than for a person, who does not know any thing of those matters respecting which it is requisite to do some act, to speak like a diviner and off-handed, whatever may present itself, and to make a guess according to the same things for himself; like persons playing at odd and even, who, knowing nothing about the even and odd, which they hold in their own hands, nevertheless happen by accident to say what is true about the same things. To consult then is oftentimes a thing of this kind, that a person, although knowing nothing of the matters, about which he is consulting, yet happens by accident to say what is the truth. If then it is a thing of this kind, I know what to consult is; if however it is not a thing of this kind, I should not know it at all.

Sisyphus:: It is not of such a kind as not to know in reality any thing at all, but to know partly something of the matter in hand, and partly not to know at all.

Socrates:: Do you mean that to consult is, by Zeus, a thing of this kind; that, as I seem to myself to divine somewhat your notions relating to the act of consulting well, it is the seeking to discover the best things for a person, to employ himself in for his own benefit, but not to know them clearly, but for this to be, as it were, in some form of a thought? Do you not mean somehow in this way.

Sisyphus:: I do.

Socrates:: Whether do men seek such things as they know, or such as they do not know?

Sisyphus:: Both.

Socrates:: Do you mean by this something of this kind, that men seek both what they know and what they do not know? just as if a person should know Callistratus, who he is; but not know to find where he is, not who is Callistratus. Do you mean that to seek both is after this manner.

Sisyphus:: I do.

Socrates:: He then, who knows Callistratus, would not seek that matter, namely, to know him.

Sisyphus:: He would not.

Socrates:: But he would, where he might be.

Sisyphus:: It seems so to myself at least.

Socrates:: Nor would he seek even this, namely, where it was possible to find him, if he knew already; but he would find him forthwith.

Sisyphus:: Yes.

Socrates:: Men then do not seek the things, which they know, but, as it seems, what they do not know. But if this reasoning appears to you to be of a captious kind, and to have been spoken, not for the sake of a practical purpose, but for conversation merely, consider the matter in this way, if the case seems to be such as has been just now stated. Do you not know that this takes place in geometry? that by geometricians the diameter is not unknown, whether it be a diameter or not,—for this I well know is not sought to be discovered by them,—but how great it is in measurement in proportion to the sides of the space which it intersects? Is not this the very thing which is sought respecting it?

Sisyphus:: So it seems at least to me.

Socrates:: For it is that, which is unknown. Is it not so?

Sisyphus:: Certainly.

Socrates:: Know you not that the doubling of the cube is sought to be discovered by geometricians, how great it is by calculation? But the cube itself is not sought for by them, whether it is a cube, or not; for that at least they know well. Is it not so?

Sisyphus:: Yes.

Socrates:: Respecting the air likewise, do you not know that Anaxagoras and Empedocles, and the rest of those, who talk about meteorology, are all seeking whether it is boundless or has a limit?

Sisyphus:: Yes I do.

Socrates:: But not the question, whether it is air. Is it not so?

Sisyphus:: It is.

Socrates:: Will you then agree with me that such is the case with all other things now that to no person is there any seeking after the things he knows, but rather after those which he does not know?

Sisyphus:: I will.

Socrates:: Did not the consulting appear to us to be this very thing, namely, that a person is seeking after the best things relating to what he would require to employ himself in for his own benefit.

Sisyphus:: Yes.

Socrates:: And the seeking was, like the consulting, about things to be done. Is it not so?

Sisyphus:: Entirely.

Socrates:: Must we not consider then at present, what impediment is in the way of those, who are seeking, to the discovery of the things, about which they are making the search?

Sisyphus:: So it seems at least to me.

Socrates:: Could we say that any thing else was an impediment to them except a want of knowledge?

Sisyphus:: Nothing else.

Socrates:: Let us, by Zeus, consider the matter very much, letting out, as the saying is, every rope, and sending out every voice. And view thou this point with me. Think you that a man could consult about music, who knows nothing of music; or how he ought to play on the guitar, or to perform any thing according to the musician's art?

Sisyphus:: Not I indeed.

Socrates:: What then, as regards generalship, or piloting? Do you think that the person, who knows neither of those arts, would have it in his power to consult about either of those matters, as to what is to be done by him, and how, who knows not to act the general or pilot?

Sisyphus:: I do not.

Socrates:: Do you think then that the case is so respecting all other matters, of which a person knows nothing; that it is not possible for him even to consult, who knows nothing about them?

Sisyphus:: I do.

Socrates:: But it is possible for him to seek to know. Is it not?

Sisyphus:: Certainly.

Socrates:: To seek then would not be the same as to consult.

Sisyphus:: How could it?

Socrates:: Because to seek is surely applied to the matters, which a person does not know; but it seems to be not possible for a person to consult about those matters, of which he is ignorant. Or has not this been said correctly?

Sisyphus:: Very much so.

Socrates:: Ye were then yesterday seeking to discover what was best for the state; but ye did not know it. For if ye had known, ye would not surely have been seeking it, just as we do not seek any thing amongst those which we know. Is it not so?

Sisyphus:: It is.

Socrates:: Whether does it seem to you, Sisyphus, if a person does not know, that he ought to seek or to learn?

Sisyphus:: To myself at least it seems, by Zeus, to learn.

Socrates:: And correctly does it seem so. But does it seem to you that he ought to learn rather than seek on this account, because a person would discover more quickly and easily, if he learnt from those, who know, than if he were to seek himself what he did not know? Or is it on some other account?

Sisyphus:: On no other than this.

Socrates:: Why did ye not then yesterday, disregarding the act of consulting about matters, of which ye knew nothing, and of seeking to do the best for the state, learn from some one of those, who did know, how ye might do the best for the state? But ye seem to me to have been sitting the whole of yesterday and speaking off-hand, and prophesying about matters, of which ye were ignorant, and neglecting to learn, both the rulers of the state and you together with them. But perhaps you will say that this has been played off by myself against you for the sake of a conversation merely, and it has not been proved to you seriously. Consider then, by Zeus, this question at least for the present with seriousness. If it were conceded that to consult is something, and not, as now discovered, to be nothing else than a knowledge according to conjecture, and a speaking off-hand, making use of merely a more solemn name, but nothing else, do you think, that as regards the act of consulting well and being good counsellors, persons differ one from another on that point, as persons differ one from another on all the other kinds of knowledge, such as carpenters from carpenters, physicians from physicians, and hautboy-players from hautboy-players, and all the rest of handicraftsmen differ from each other? As then those engaged in these arts differ, think you that in the act of consulting persons would differ at all in this manner, one from another?

Sisyphus:: Yes I do.

Socrates:: Now tell me, do not all, both those who consult well, and those who do so ill, consult about matters that are about to be?

Sisyphus:: Certainly.

Socrates:: Is the future any thing else than what is not as yet?

Sisyphus:: It is not.

Socrates:: For if it were, it would not surely be still about to be, but it would be already. Is it not so?

Sisyphus:: Yes.

Socrates:: Therefore that, which is not yet, in reality has not been produced.

Sisyphus:: It has not.

Socrates:: Therefore that, which is not and has not been produced, has no existence in reality.

Sisyphus:: It has not.

Socrates:: Do not all, then, who consult well or ill, consult about things which neither are, nor have been, and which have no existence, when they consult respecting things about to be?

Sisyphus:: At least they seem so.

Socrates:: Does it seem to you possible for a person to hit well or ill a thing, that does not exist?

Sisyphus:: How say you this?

Socrates:: I will explain, what I mean to say. Consider then. How would you distinguish out of many archers, which of them was the good and which the bad?

Sisyphus:: Surely this is not difficult to know.

Socrates:: For perhaps you would bid them shoot at some mark. Is it not so?

Sisyphus:: Certainly.

Socrates:: Would you not decide that he is the conqueror, who hits most often the mark in a direct way.

Sisyphus:: Yes, I would.

Socrates:: But if there were no mark laid down for them to shoot at, but each shot where he liked, how could you distinguish between the good and bad archer?

Sisyphus:: Not at all.

Socrates:: Would you then not be at a loss to distinguish between those consulting well or ill, if they did not know what they were consulting about?

Sisyphus:: Yes, I should.

Socrates:: Do not those then, who consult respecting things about to be, consult respecting things not in existence?

Sisyphus:: Certainly.

Socrates:: It is not therefore possible for any person to hit the thing not in existence. For how does any one seem to you to be able to hit, what is not in existence?

Sisyphus:: Not at all. '

Socrates:: Since then it is not possible to hit, what is not in existence, no one would be able to hit any thing of those not in existence by consulting. For things that are about to be belong to those not in existence. Is it not so?

Sisyphus:: So it seems at least to me.

Socrates:: He then, who does not hit things about to be, would be amongst men neither a good counsellor, nor a bad counselor.

Sisyphus:: It seems he would not.

Socrates:: Nor is a person said to be either a better counsellor, or a worse counsellor, not even if he should be more successful or less successful in hitting, what is not in existence.

Sisyphus:: He is not.

Socrates:: Looking then to what circumstance men call certain persons by the name of good counsellors, or bad counsellors, is it not worthy, Sisyphus, to think again upon this matter?

Sisyphus:: I say so.

# Sisyphus

Translated by David Gallop.

Socrates, Sisyphus

Socrates:: We waited a long time for you yesterday as well, Sisyphus, before Stratonicus’ show, so that you could join us in hearing a real master giving a performance full of splendid material, both in theory and in practice; but after we gave up thinking you were coming, we went to hear the man by ourselves.

Sisyphus:: Yes, that’s absolutely right—some business arose, you see, which was fairly urgent, so I couldn’t ignore it. Our authorities were in conference yesterday, so they required me to join their deliberations; and if the authorities summon any of us to join their deliberations, we citizens of Pharsalus are legally bound to comply.

Socrates:: Well, it’s a splendid thing to obey the law, and also to be considered a good deliberator by one’s fellow citizens—as you yourself are considered to be one of the good deliberators in Pharsalus. Still, I’m not in a position to take issue with you about good deliberation, Sisyphus, at the moment; that, I think, would call for a lot of leisure and a long argument—but I'd like to propose a discussion with you about deliberation itself, first of all, about what it is.

What could deliberation itself be? Could you tell me that?—not how to do it well or badly or splendidly, but just what sort of thing deliberation itself is? Surely you could do that quite easily, being such a good deliberator yourself? I hope I’m not being too inquisitive by questioning you on the subject.

Sisyphus:: Can it really be that you don’t know what deliberation is?

Socrates:: Indeed I don’t, Sisyphus, at least if it differs at all from what’s done by a man who lacks understanding on some matter calling for action, guessing his answer by divining or making it up: he says whatever comes into his head, just like people who play odds-and-evens; they have no idea, of course, whether they’re holding an even or an odd number of things in their hands, yet when they say which it is, they hit upon the truth. Perhaps deliberation is also something like that: someone who has no understanding of what he’s deliberating about is just lucky in what he says, and hits upon the truth. If it’s something like that, then I do know roughly what deliberation is; but if it’s not like that, then I don’t understand it at all.

Sisyphus:: But surely, it’s not like being utterly and completely ignorant of some matter, but like being familiar with part of it, while not yet understanding the rest.

Socrates:: Perhaps you mean that deliberation is—Heaven help me! I feel as if I’m almost divining your view about good deliberation—do you mean it’s something like this? Someone is trying to find out what would be the best course of action to take, and doesn’t yet clearly understand it, but is rather in the process of thought, as it were? Is that more or less what you mean?

Sisyphus:: Yes, it is.

Socrates:: Which do people try to find out—matters which they know, or ones which they don’t know?

Sisyphus:: Both.

Socrates:: When you say that people try to find out both—things they do know as well as things they don’t—perhaps you mean something like this: one might, for example, be acquainted with Callistratus—know who he was—yet not know where he was to be found. Is that what you mean by trying to find out both?

Sisyphus:: Yes, it is.

Socrates:: Now you wouldn’t try to find out the former, knowing Callistratus, at least if you knew him?

Sisyphus:: Of course not.

Socrates:: But you might try to find out where he was.

Sisyphus:: Yes, I think you might.

Socrates:: Nor, again, would you try to discover where the man was to be found, if you knew that; in that case, you would go and find him right away, wouldn’t you?

Sisyphus:: Yes.

Socrates:: Apparently, then, it isn’t things which people know that they try to find out, but things they don’t know.

But that argument may strike you as captious, Sisyphus, put forward not with a view to the truth of the matter, but merely as a debating point. If so, look at it this way, and see if you agree with what was just said. You know, don’t you, what happens in geometry: the diagonal is unknown to geometers, yet there’s no question whether it is or is not a diagonal— that’s not what they’re trying to find out at all— but rather, how long it is in relation to the sides of the areas it bisects. Isn’t that what they’re trying to find out about the diagonal?

Sisyphus:: I believe so.

Socrates:: And that is something unknown, isn’t it?

Sisyphus:: Absolutely.

Socrates:: Or again, take the doubling of the cube. You know, don’t you, that geometers try to find out, by reasoning, how big it is? As for the cube itself, they don’t try to find out whether it’s a cube or not. That much they know, don’t they?

Sisyphus:: Yes.

Socrates:: Or again, consider the upper air. You surely know that what Anaxagoras and Empedocles and all the rest of the cosmologists are trying to find out is whether it's infinite or finite.

Sisyphus:: Yes.

Socrates:: But they don't ask whether it is air, do they now?

Sisyphus:: Of course not.

Socrates:: In all such cases, then, our conclusion is as follows: nobody can ever try to find out anything that he knows, only what he doesn't know. Would you agree with me about that?

Sisyphus:: I would.

Socrates:: Now isn't this what deliberation seemed to us to be—somebody trying to find out the best course to follow in matters requiring him to take action?

Sisyphus:: Yes.

Socrates:: And we thought that deliberation was trying to find out something concerning practical matters, didn't we?

Sisyphus:: Yes, of course.

Socrates:: So now it's time for us to consider what it is that prevents people from finding out what they're trying to find out.

Sisyphus:: I think it is.

Socrates:: And what should we say it is that prevents them, if not incomprehension?

Sisyphus:: Let's look into it, for Heaven's sake.

Socrates:: Absolutely!—we must let out every reef, as they say, and raise full cry.

So now let's examine the following question together: do you think it's possible for a man to deliberate about music if he has no knowledge of music, and knows neither how to play the cithara nor how to perform any other kind of music?

Sisyphus:: No, I don’t.

Socrates:: And what about military or nautical expertise? Would someone who knew neither of those subjects be able to deliberate at all about what he should do in either field? Would he be able to deliberate about how to command a force or captain a vessel if he lacked all knowledge of military or nautical matters?

Sisyphus:: No.

Socrates:: And would you expect the same to hold in all other fields? It is quite impossible for someone who doesn’t understand something either to know or to deliberate about what he doesn’t understand.

Sisyphus:: I agree.

Socrates:: But it is possible to try to find out what one doesn’t know; isn’t that right?

Sisyphus:: Certainly.

Socrates:: Then trying to find out can no longer be identified with deliberating.

Sisyphus:: Why not?

Socrates:: Because what one tries to find out is evidently something one doesn’t know, whereas apparently no human being can deliberate about what he doesn’t know. Wasn’t that what we just said?

Sisyphus:: It certainly was.

Socrates:: And isn’t that what you Pharsalians were doing yesterday, trying to find out the best things for your city to do, yet not knowing them? Because if you knew them, you surely wouldn’t still have been trying to find them out—just as we don’t try to find out anything else we already know, do we?

Sisyphus:: No, we don’t.

Socrates:: And if one doesn’t know something, Sisyphus, which do you think one should do: try to find it out or learn it?

Sisyphus:: Learn it, for Heaven’s sake; that’s what I think.

Socrates:: And there you’re right. But tell me, is it for the following reason that you think one should learn it rather than try to find it out? One can discover it more quickly and easily by learning it from those who understand it, than by trying to find it out on one’s own, when one doesn’t know it. Or is there some other reason?

Sisyphus:: No, that is the reason.

Socrates:: Well then, why did you people take the trouble to deliberate yesterday on matters you don’t understand, and try to find out the best course of action for the city to take? Why weren’t you learning those things, rather, from someone who understands them, so that you could take the best course of action for the city? Instead, it seems to me that you spent the whole day yesterday sitting there, making things up and divining about matters you didn’t understand, instead of taking the trouble to learn them—I mean those who govern your city, including you.

Perhaps you’ll say that I’ve been jesting at your expense merely for the sake of having a discussion, but that you think nothing has been seriously proved. Yet you’ll certainly have to take this next point seriously, Sisyphus. Suppose it be granted that there is such a thing as deliberation; suppose it does not, as was discovered just now, prove identical with sheer incomprehension, guesswork, or making things up, no different, but just using a grander name for it. In that case, don’t you think there’s a difference between some people and others with respect to deliberating well or being good deliberators, just as some people differ from others in all other areas of expertise—as, for example, some carpenters differ from others, or some doctors from others, or some pipers from others, or as tradesmen in general differ from one another? Just as those experts differ in their respective skills, don't you think the same applies to deliberating—that there's a difference between some people and others?

Sisyphus:: Yes, I do.

Socrates:: Now tell me, don't all those who deliberate either well or badly deliberate about things that are going to exist in the future?

Sisyphus:: Certainly.

Socrates:: And what's in the future doesn't exist yet. Isn't that right?

Sisyphus:: Of course.

Socrates:: Because otherwise, presumably, it wouldn't still be going to exist in the future, but would exist already, wouldn't it?

Sisyphus:: Yes.

Socrates:: And if it doesn't exist yet, it hasn't yet come into being either.

Sisyphus:: No, it hasn't.

Socrates:: But if it hasn't even yet come into being, then it doesn't yet possess any nature of its own either, does it?

Sisyphus:: None at all.

Socrates:: Then those who deliberate well and those who do it badly are all deliberating about matters that neither exist nor have come into being nor possess any nature, whenever they deliberate about what's in the future. Isn't that right?

Sisyphus:: It does appear to be.

Socrates:: Now do you think it’s possible for anyone to hit upon the nonexistent either well or badly?

Sisyphus:: What do you mean by that?

Socrates:: I’ll show you what I’m suggesting. Consider a number of archers. How would you distinguish which of them was a good marksman and which was a poor one? That’s not hard to tell, is it? You would presumably ask them to aim at some target.

Sisyphus:: Certainly.

Socrates:: And the one who most often succeeded in hitting the target you would judge the winner?

Sisyphus:: I would.

Socrates:: But if there were no target set up for them to aim at, and each just shot wherever he pleased, how could you distinguish between the good marksman and the poor one?

Sisyphus:: I couldn’t.

Socrates:: And wouldn’t you also be at a loss to distinguish good deliberators from bad ones, if they didn’t understand what they were deliberating about?

Sisyphus:: I would.

Socrates:: And if those who deliberate are deliberating about matters in the future, they’re deliberating about matters that don’t exist, aren’t they?

Sisyphus:: Absolutely.

Socrates:: And it’s impossible, isn’t it, for anyone to hit upon the nonexistent. How do you think anyone could ever hit upon what doesn’t exist?

Sisyphus:: It can’t be done.

Socrates:: And since it’s impossible to hit upon the nonexistent, no one who’s deliberating about the nonexistent could actually hit upon it. For the future is something that doesn’t exist, isn’t it?

Sisyphus:: So I believe.

Socrates:: Then since nobody can hit upon what’s in the future, no human being can actually be good or bad at deliberation.

Sisyphus:: Apparently not.

Socrates:: Nor can one person be either a better or a worse deliberator than another, if one cannot, in fact, be more or less successful at hitting upon the nonexistent.

Sisyphus:: Indeed not.

Socrates:: So what standard could people possibly have in mind when they call certain people good or bad deliberators? Don’t you think, Sisyphus, that it would be worth delving into this again some time?

## Timaeus

The dead giveaway that this is certainly not a Platonic dialog is a direct quote:

> Socrates:: I will. The main subject of my discourse yesterday was a political constitution, and the kind of principles and citizens which seemed to me likely to render it most perfect.

Which is not even close to the stated purpose of the dialog called the *Republic* nor its very explicit ending. This writer either never read it and only knew it by rumor, or was obviously very illiterate. He obviously did not read the second and tenth book. In the tenth book, the concessions made in the second book where released, i.e. the good people could reap the benefits of being good, and could marry whom the wished and take on the jobs that they wished. This author, like so many in history, is wholly unaware of what Plato actually said, this so called ideal Republic put the best of people in the worst hell he could imagine. Plato was not stupid enough not to know his own words.

Thus, as this dialog precedes Critias, by the same author, etc., proves, besides the fact Critias had nothing to do with the mythical island of Atlantis was to detail a myth about the generations of the gods, a topic which Socrates in the Platonic dialogs refused to discus, means that neither of these are Platonic, not to mention, neither of them have a thing to do with dialectic, what Plato was teaching. It also accounts for why Critias was never finished. Plato wrote to preserve dialectic, he would not have written these pointless dialogs to begin with.

Those people claiming to be both scientist, etc., who go looking for Atlantis, a fiction which is provably NOT written by Plato, are only confirming for those who are literate, that they are wholly illiterate. Oh, gosh, why can't we find Atlantis? Maybe you should start looking for Dorothy's emerald slippers instead.

Now, one thing which could have saved the mythologist, is that Critias was suppose to have originated from Solon, no trace of that in history, and to have been brought back with him as preserved histories in Egyptian temples, no trace that I know of for that either.

Can anyone inform me how the name Lucifer gets into a Greek translation by Davis, Jowett and Taylor?

How is it that anyone can claim that this is a Platonic Dialog when, by the text alone, the author is factually ignorant concerning the very same dialog it is suppose to be an off take of, ignorant of dialectic, and ignorant of Plato's style of writing unless one has a very short memory and illiterate to boot? The very fact that Aristotle quotes from this dialog means that he could not spot if a dialog was written by Plato or not, unless, a number of these forgeries originated from Aristotle himself who was as artless as these forgeries. In fact, Aristotle is more apt to quote, repeatedly, from dialogs which show no Platonic art at all than those that do. I find that very suspect. At best, Aristotle could not have been testifying to a dialog of Plato, but only to the rumors about the dialogs of Plato unless he was illiterate. The fact is, how could you understand Plato, and not know that he was speaking about grammar in terms of provable biological fact?

When Plato said that there were some who could spend a very long time at his Academy and never get it, Aristotle was definitely one of those. However, as Aristotle had a phenomenal memory, but an I.Q. commensurate with the common man, he became more popular among the masses. One could say, Aristotle was a man's man, while Plato was man's man.

Notice the opening of this, the interlocutors were mentioned as visitors, when at least two of them were familiar friends of Socrates. The last person to be misquoting Plato, one would assume would be Plato. And the first to testify is a dialog were Platonic or not, would be the text itself, especially when it is historical fact about pranks pulled on Plato by Aristotle, see the fragments in regard to the works of Aristotle.

Aristotle was a naturalist, and Socrates in the other dialogs never mentions the spectacle of animals being something of beauty and wonder, not even in battle. Many of Socrates opinions in this dialog are diametrically opposed to views he stated several times in the actual Platonic dialogs. Plato never portrayed Socrates as being schizophrenic or at least forgetful.

Another similarity with Aristotle, is God described by Aristotle in his works, and here as a stuck record. God thinking about thinking, and God thinking the same thoughts about the same things over and over.

Here, in this dialog, one is told why the dialog Critias is unfinished.

> And too bad that he never finished the story he'd brought back home with him from Egypt. He was forced to abandon that story on account of the civil conflicts and all the other troubles he found here when he returned.

Being unfinished was supposed to add to its authenticity. And so, we have a story, originating from Solon, who brought it back from Egypt as part of their preserved histories, which have never been found in either place but in this dialog. The story is actually finished in the opening of this one.

> What I've just related, Socrates, is a concise version of old Critias' story, as Solon originally reported it

So, when scholars say the story is unfinished, well, maybe they should read them in the order indicated by the two dialogs as a single story with two chapters.

I get this urge to start a funding for the search for Dorothy's Ruby Red Slippers. Finding them would be very helpful in finding one's way home.

# The Timaeus of Plato

Translated by R. D. Archer-Hind, M.A. 1888

PERSONS OF THE DIALOGUE:

Sokrates, Timaeus, Hermokrates, Kritias.

Socrates:: One, two, three—what is become of the fourth, my dear Timaeus, of our yesterday's guests and our entertainers of to-day?

Timaeus:: He has fallen sick, Sokrates: he would not willingly have been missing at this gathering.

Socrates:: Then it is for you and your companions, is it not, to fulfil the part of our absent friend?

Timaeus:: Unquestionably; and we will omit nothing that lies in our power. For indeed it would not be fair, seeing how well we were entertained by you yesterday, that the rest of us should not heartily requite you with a fitting return of hospitality.

Socrates:: Do you remember the extent and scope of the subjects I appointed for your discussion?

Timaeus:: In part we remember; and whatever we have forgotten, you are here to aid our memory. But I should prefer, if it is not troublesome, that you should briefly recapitulate them from beginning to end, that they may be more firmly fixed in our minds.

Socrates:: I will. The main subject of my discourse yesterday was a political constitution, and the kind of principles and citizens which seemed to me likely to render it most perfect.

Timaeus:: Yes, and what you said, Sokrates, was very much to the satisfaction of us all.

Socrates:: Was not our first step to separate the agricultural class and tradesmen in general from those who were to be the defenders of our state?

Timaeus:: It was.

Socrates:: And in assigning on natural principles but one single pursuit or craft which was suited to each citizen severally, we declared that those whose duty it was to fight on behalf of the community must be guardians only of the city, in case any one whether without or within her walls should seek to injure her, and that they should give judgment mercifully to their subjects and natural friends, but show themselves stern to the enemies they met in battle.

Timaeus:: Quite true.

Socrates:: For we described, I think, a certain temperament which the souls of our guardians must possess, combining in a peculiar degree high spirit and thoughtfulness, that they might be able to show a due measure of mildness or sternness to friend or foe.

Timaeus:: Yes.

Socrates:: And what of their training? were they not to have been trained in gymnastic and music and all studies which are connected with these?

Timaeus:: Just so.

Socrates:: And those who had undergone this discipline, we said, must not consider that they have any private property in gold or silver or anything else whatsoever, but as auxiliaries drawing from those whom they preserved so much pay in return for their protection as was sufficient for temperate men, they were to spend it in common and pass their lives in company with one another, devoting themselves perpetually to the pursuit of virtue and relieved from all other occupations.

Timaeus:: That also is the way it was put.

Socrates:: Moreover with regard to women we observed that their natures must be brought into harmonious similarity with those of men, and that the same employments must be assigned to them all both in war and in their general mode of life.

Timaeus:: Yes, that was what we said.

Socrates:: And what were our rules concerning the procreation of children? This, I think, is easy of recollection because of the novelty of our scheme. We ordained that the rights of marriage and of children should be common to all, to the end that no one should ever know his own offspring, but that each should look upon all as his kindred, regarding as sisters and brethren all such as were between suitable limits of age, and those of the former and previous generations as parents and grandparents, and those after them as children and children's children.

Timaeus:: Yes, it is very easy to remember this too as you describe it.

Socrates:: Next with a view to securing immediately the utmost possible perfection in their natures, do we not remember that it was incumbent on the rulers of both sexes to make provision for the contraction of marriages by some secret mode of allotment, that to the good and bad separately might be allotted mates of their own kind, and so no ill-feeling should arise among them, supposing as they would that chance governed the allotment?

Timaeus:: We remember that.

Socrates:: And the offspring of the good we said must be reared, while that of the bad was to be secretly dispersed among the other classes of the state; and continually observing them as they grew up, the rulers were to restore to their rank such as were worthy, and in the places of those so promoted substitute the unworthy in their own rank.

Timaeus:: Quite so.

Socrates:: Have we now said enough for a summary recapitulation of yesterday’s discourse? or do we feel that anything is lacking, my dear Timaeus, to our account?

Timaeus:: Not at all:- you have exactly described what was said, Sokrates.

Socrates:: Listen then and I will tell you in the next place what I feel about the constitution which we described. My feeling is something like this: suppose a man, on beholding beautiful creatures, whether the work of the painter or really alive but at rest, should conceive a desire to see them in motion and putting into active exercise the qualities which seemed to belong to their form—this is just what I feel about our city which we described: I would fain listen to one who depicted her engaged in a becoming manner with other countries in those struggles which cities must undergo, and going to war, and when at war showing a result worthy of her training and education, both when dealing in action and parleying in speech with other cities. Now, Kritias and Hermokrates, my own verdict upon myself is that I should never be capable of celebrating the city and her people according to their merit. So far as concerns me indeed, that is no marvel; but I have formed the same opinion about the poets, both past and present; not that I disparage the poetic race, but any one can see that the imitative tribe will most easily and perfectly imitate the surroundings amid which they have been brought up, but that which lies outside the range of each man’s experience is hard to imitate correctly in actions and yet harder in words. As to the class of sophists on the other hand, I have always held them to be well furnished with many fine discourses on other subjects; yet I am afraid, seeing they wander from city to city and have never had dwellings of their own to manage, they may somehow fall short in their conception of philosophers and statesmen, as to what in time of war and battles they would do and say in their dealings and converse with divers people. One class then remains, those who share your habit of mind, having by nature and training a capacity for both philosophy and statecraft. Timaeus for instance, belonging to an admirably governed state, the Italian Lokris, and one of the foremost of its citizens in wealth and birth, has filled offices of the highest authority and honour in his native city, and has also in my judgment climbed to the topmost peak of all philosophy: while at Athens we all know that Kritias is no novice in any of the questions we are discussing: of Hermokrates too we must believe on the evidence of many witnesses that his genius and acquirements qualify him to deal with all such matters. This was in my mind yesterday when I willingly complied with your request that I should repeat the conversation concerning the ideal polity; for I knew that no men were more competent than you, if you were willing, to supply the sequel: no one else indeed at the present day could, after engaging our city in an honourable war, render her conduct worthy of her in all respects. So after saying all that was enjoined on me I in my turn enjoined upon you the task of which I now remind you. Accordingly you consulted together and agreed to entertain me at this time with a return ‘feast of reason’. I am here then ready for it in festal array, and never was there a more eager guest.

Hermocrates:: Indeed, Sokrates, as Timaeus said, there will be no lack of zeal on our part, nor can we attempt to excuse ourselves from performing the task. In fact yesterday immediately on leaving this spot, when we reached the guest-chamber at the house of Kritias where we are staying, and even before that on our way thither, we were discussing this very matter. Kritias then told us a story from an old tradition, which you had better repeat now, Kritias, to Sokrates, that he may help us to judge whether it will answer the purpose for our present task or not.

Critias:: So be it, if our third partner Timaeus agrees.

Timaeus:: I quite agree.

Critias:: Listen then, Sokrates, to a tale which, strange though it be, is yet perfectly true, as Solon, the wisest of the seven, once affirmed. He was a relation and dear friend of Dropides, my great-grandfather, as he says himself in many passages of his poems: and Dropides told my grandfather Kritias, who when advanced in life repeated it to us, that there were great and marvellous exploits achieved by Athens in days of old, which through lapse of time and the perishing of men have vanished from memory: and the greatest of all is one which it were fitting for us to narrate, and so at once discharge our debt of gratitude to you and worthily and truly extol the goddess in this her festival by a kind of hymn in her honour.

Socrates:: A good proposal. But what was this deed which Kritias described on the authority of Solon as actually performed of old by this city, though unrecorded in history?

Critias:: I will tell an ancient story that I heard from a man no longer young. For Kritias was then, as he said, hard upon ninety years of age, while I was about ten. It happened to be the ‘children’s day’ of the Apaturia; and then as usual the boys enjoyed their customary pastime, our fathers giving us prizes for reciting poetry. A great deal of poetry by various authors was recited, and since that of

Solon was new at the time, many of us children sang his poems. So one of the clansmen said, whether he really thought so or whether he wished to please Kritias, he considered that Solon was not only in other respects the wisest of mankind but also the noblest of all poets The old man—how well I recollect it—was extremely pleased and said smiling, Yes, Amynandros, if he had not treated poetry merely as a by-work, but had made a serious business of it like the rest, and if he had finished the legend which he brought hither from Egypt, instead of being compelled to abandon it by the factions and other troubles which he found here on his return, my belief is that neither Hesiod nor Homer nor any other poet would have enjoyed greater fame than he. What was the legend, Kritias? asked Amynandros. It concerned a mighty achievement, he replied, and one that deserved to be the most famous in the world; a deed which our city actually performed, but owing to time and the destruction of the doers thereof the story has not lasted to our times. Tell us from the beginning, said the other, what was the tale that Solon told, and how and from whom he heard it as true.

There is in Egypt, said Kritias, in the Delta, at the apex of which the stream of the Nile divides, a province called the Saitic; and the chief city of this province is Sais, the birthplace of Amasis the king. The founder of their city is a goddess, whose name in the Egyptian tongue is Neith, and in Greek, as they aver, Athena: the people are great lovers of the Athenians and claim a certain kinship with our countrymen. Now when Solon travelled to this city he said he was most honourably entreated by the citizens; moreover when he questioned concerning ancient things such of the priests as were most versed therein, he found that neither he nor any other Grecian man, one might well-nigh say, knew aught about such matters. And once, when he wished to lead them on to talk of ancient times, he essayed to tell them of the oldest legends of Hellas, of Phoroneus who was called the first man, and of Niobe; and again he told the tale of Deukalion and Pyrrha, how they survived after the deluge, and he reckoned up their descendants, and tried, by calculating the periods, to count up the number of years that passed during the events he related. Then said one of the priests, a man well stricken in years, O Solon, Solon, ye Greeks are ever children, and old man that is a Grecian is there none. And when Solon heard it, he said, What meanest thou by this? And the priest said, Ye are all young in your souls; for ye have not in them because of old tradition any ancient belief nor knowledge that is hoary with old. And the reason of it is this: many and manifold are the destructions of mankind that have been and shall be; the greatest are by fire and by water; but besides these there are lesser ones in countless other fashions. For indeed that tale that is also told among you, how that Phaethon, the child of the Sun, yoked his father's chariot, and for that he could not drive in his father's path, he burnt up all things upon earth and himself was smitten by a thunderbolt and slain—this story, as it is told, has the fashion of a fable; but the truth of it is a deviation of the bodies that move round the earth in the heavens, whereby comes at long intervals of time a destruction with much fire of the things that are upon earth. Thus do such as dwell on mountains and in high places and in dry perish more widely than they who live beside rivers and by the sea. Now the Nile, which is in all else our preserver, saves us then also from this distress by releasing his founts: but when the gods send a flood upon the earth, cleansing her with waters, those in the mountains are saved, the neatherds and shepherds, but the inhabitants of the cities in your land are swept by the rivers into the sea. But in this country neither then nor at any time does water fall from on high upon the fields, but contrariwise all rises up by nature from below. Wherefore and for which causes the legends preserved here are the most ancient that are told: but the truth is that in all places, where exceeding cold or heat does not forbid, there are ever human beings, now more, now fewer. Now whether at Athens or in Egypt, or in any other place whereof we have tidings, anything noble or great or otherwise notable has occurred, we have all written down and preserved from ancient times in our temple here. But with you and other nations the commonwealth has only just been enriched with letters and all else that cities require: and again after the wonted term of years like a recurring sickness comes rushing on them the torrent from heaven; and it leaves only the unfettered and untaught among you, so that as it were ye become young again with a new birth, knowing nought of what happened in the ancient times either in our country or in yours. For instance the genealogies, Solon, which you just now recounted, concerning the people of your country, are little better than children's tales. For in the first place ye remember but one deluge, whereas there had been many before it; and moreover ye know not that the fairest and noblest race among mankind lived once in your country, whence ye sprang and all your city which now is, from a very little seed that of old was left over. Ye however know it not, because the survivors lived and died for many generations without utterance in writing. For once upon a time, Solon, far back beyond the greatest destruction by waters, that which is now the city of the Athenians was foremost both in war and in all besides, and her laws were exceedingly righteous above all cities. Her deeds and her government are said to have been the noblest among all under heaven whereof the report has come to our ears. And

Solon said that on hearing this he was astonished, and used all urgency in entreating the priests to relate to him from beginning to end all about those ancient citizens. So the priest said, I grudge thee not, O Solon, and I will tell it for thy sake and for the sake of thy city, and chiefly for the honour of the goddess who was the possessor and nurse and instructress both of your city and of ours; for she founded yours earlier by a thousand years, having taken the seed of you from Earth and Hephaistos; and ours in later time. And the date of our city's foundation is recorded in our sacred writings to be eight thousand years ago. But concerning the citizens of Athens nine thousand years ago I will inform you in brief of their laws and of the noblest of the deeds which they performed: the exact truth concerning everything we will examine in due order hereafter, taking the actual records at our leisure.

Consider now their laws in comparison with those of our country; for you will find here at the present day many examples of the laws which then existed among you:—first the separation of the priestly caste from the rest; next the distinction of the craftsmen, that each kind plies its own craft by itself and mingles not with another; and the class of shepherds and of hunters and of husbandmen are set apart; and that of the warriors too you have surely noticed is here sundered from all the other classes; for on them the law enjoins to study the art of war and nought else. Furthermore there is the fashion of their arming with spears and shields, wherewith we have been the first men in Asia to arm ourselves; for the goddess taught this to us, as she did first to you-in that country of yours. Again as regards knowledge, you see how careful our law is in its first principles, investigating the laws of nature till it arrives at divination and medicine, the object of which is health, drawing from these divine studies lessons useful for human needs, and adding to these all the sciences that are connected therewithal. With all this constitution and order the goddess established you when she founded your nation first; choosing out the spot in which ye were born because she saw that the mild temperament of its seasons would produce the highest intelligence in its people. Seeing then that the goddess was a lover of war and of wisdom, she selected the spot that should bring forth men likest to herself, and therein she first founded your race. Thus then did ye dwell governed by such laws as I have described, ay and even better still, surpassing all men in excellence, as was meet for them that were offspring and nurslings of gods.

Many and mighty are the deeds of your city recorded here for the marvel of men; but one is there which for greatness and nobleness surpasses all the rest. For our chronicles tell what a power your city quelled of old, that marched in wanton insolence upon all Europe and Asia together; issuing yonder from the Atlantic ocean. For in those days the sea there could be crossed, since it had an island before the mouth of the strait which is called, as ye say, the pillars of Herakles. Now this island was greater than Libya and Asia together; and therefrom there was passage for the sea-farers of those times to the other islands, and from the islands to all the opposite continent which bounds that ocean truly named. For these regions that lie within the strait aforesaid seem to be but a bay having a narrow entrance; but the other is ocean verily, and the land surrounding it may with fullest truth and fitness be named a continent. In this island Atlantis arose a great and marvellous might of kings, ruling over all the island itself, and many other islands, and parts of the mainland; and besides these, of the lands east of the strait they governed Libya as far as Egypt, and Europe to the borders of Etruria. So all this power gathered itself together, and your country and ours and the whole region within the strait it sought with one single swoop to enslave. Then, O Solon, did the power of your city shine forth in all men’s eyes glorious in valour and in strength. For being foremost upon earth in courage and the arts of war, sometimes she was leader of the Hellenes, sometimes she stood alone perforce, when the rest fell away from her; and after being brought into the uttermost perils, she vanquished the invaders and triumphed over them: and the nations that were not yet enslaved she preserved from slavery; while the rest of us who dwell this side the pillars of Herakles, all did she set free with ungrudging hand. But in later time, after there had been exceeding great earthquakes and floods, there fell one day and night of destruction; and the warriors in your land all in one body were swallowed up by the earth, and in like manner did the island Atlantis sink beneath the sea and vanish away. Wherefore to this day the ocean there is impassable and unsearchable, being blocked by very shallow shoals, which the island caused as she settled down.

You have heard this brief statement, Sokrates, of what the ancient Kritias reported that he heard from Solon: and when you were speaking yesterday about the polity and the men whom you described, I was amazed as I called to mind the story I have just told you,- remarking how by some miraculous coincidence most of your account agreed unerringly with the description of Solon. I was unwilling however to say anything at the moment, for after so long a time my memory was at fault. I conceived therefore that I must not speak until I had thoroughly gone over the whole story by myself. Accordingly I was quick to accept the task you imposed on us yesterday, thinking that for the most arduous part of all such undertakings, I mean supplying a story fitly corresponding to our intentions, we should be fairly well provided. So then, as Hermokrates said, as soon as ever I departed hence yesterday, I began to repeat the legend to our friends as I remembered it; and when I got home I recovered nearly the whole of it by thinking it over at night. How true is the saying that what we learn in childhood has a wonderful hold on the memory. Of what I heard yesterday I know not if I could call to mind the whole: but though it is so very long since I heard this tale, I should be surprised if a single point in it has escaped me. It was with much boyish delight that I listened at the time, and the old man was glad to instruct me, (for I asked a great many questions); so that it is indelibly fixed in my mind, like those encaustic pictures which cannot be effaced. And I narrated the story to the rest the first thing in the morning, that they might share my affluence of words. Now therefore, to return to the object of all our conversation, I am ready to speak, Sokrates, not only in general terms, but entering into details, as I heard it. The citizens and the city which you yesterday described to us as in a fable we will transfer to the sphere of reality and to our own country, and we will suppose that ancient Athens is your ideal commonwealth, and say that the citizens whom you imagined are those veritable forefathers of ours of whom the priest spoke. They will fit exactly, and there will be nothing discordant in saying that they were the men who lived in those days. And dividing the work between us we will all endeavor to render an appropriate fulfilment of your injunctions. So you must consider, Sokrates, whether this story of ours satisfies you, or whether we must look for another in its stead.

Socrates:: How could we change it for the better, Kritias? It is specially appropriate to this festival of the goddess, owing to its connexion with her; while the fact that it is no fictitious tale but a true history is surely a great point. How shall we find other such citizens if we relinquish these? It cannot be: so with Fortune's favour do you speak on, while I in requital for my discourse of yesterday have, in my turn the privilege of listening in silence.

Critias:: Now consider, Sokrates, how we proposed to distribute your entertainment. We resolved that Timaeus, who is the best astronomer among us, and who has most of all made it his business to understand universal nature, should speak first, beginning with the origin of the universe, and should end with the birth of mankind: and that I should follow, receiving from him mankind brought to being in theory, and from you a portion of them exceptionally cultivated; and that in accordance with Solon's laws, no less than with his statement, I should introduce them before our tribunal and make them our fellow-citizens, as being the Athenians of bygone days, whom the declaration of the sacred writings has delivered from their oblivion; and thenceforward we shall speak as if their claim to Athenian citizenship were fairly established.

Socrates:: Ample and splendid indeed, it seems, will be the banquet of discourse which I am to receive in my turn. So it would seem to be your business to speak next, Timaeus, after you have duly invoked the gods.

Timaeus:: Yes indeed, Sokrates, that is what all do who possess the slightest share 'of judgment; at the outset of every work, great or small, they always call upon a god: and seeing that we are going to enter on a discussion of the universe, how far it is created or perchance uncreate, unless we are altogether beside ourselves, we must needs invoke the gods and goddesses and pray above all that our discourse may be pleasing in their sight, next that it may be consistent with itself. Let it suffice then thus to have called upon the gods; but we must call upon ourselves likewise to conduct the discourse in such a way that you will most readily comprehend me, and I shall most fully carry out my intentions in expounding the subject that is before us.

First then in my judgment this distinction must be made. What is that which is eternally and has no becoming, and again what is that which comes to be but is never? The one is comprehensible by thought with the aid of reason, ever changeless; the other opinable by opinion with the aid of reasonless sensation, becoming and perishing, never truly existent. Now all that comes to be must needs be brought into being by some cause: for it is impossible for anything without a cause to attain to birth. Of whatsoever thing then the Artificer, looking ever to the changeless and using that as his model, works out the design and function, all that is so accomplished must needs be fair: but if he look to that which has come to be, using the created as his model, the work is not fair. Now as to the whole heaven or order of the universe—for whatsoever name is most acceptable to it, be it so named by us—we must first ask concerning it the question which lies at the outset of every inquiry, whether did it exist eternally, having no beginning of generation, or has it come into being, starting from some beginning? It has come into being: for it can be seen and felt and has body; and all such things are sensible, and sensible things, apprehensible by opinion with sensation, belong, as we saw, to becoming and creation. We say that what has come to be must be brought into being by some cause. Now the maker and father of this All it were a hard task to find, and having found him, it were impossible to declare him to all men. However we must again inquire concerning him, after which of the models did the framer of it fashion the universe, after the changeless and abiding, or after that which has come into being? If now this universe is fair and its Artificer good, it is plain that he looked to the eternal; but if—nay it may not even be uttered without impiety,—then it was to that which has come into being. Now it is manifest to every one that he looked to the eternal: for the universe is fairest of all things that have come to be, and he is the most excellent of causes. And having come on this wise into being it has been created in the image of that which is comprehensible by reason and wisdom and changes never. Granting this, it must needs be that this universe is a likeness of something. Now it is all-important to make our beginning according to nature: and this affirmation must be laid down with regard to a likeness and its model, that the words must be akin to the subjects of which they are the interpreters: therefore of that which is abiding and sure and discoverable by the aid of reason the words too must be abiding and unchanging, and so far as it lies in words to be incontrovertible and immovable, they must in no wise fall short of this; but those which deal with that which is made in the image of the former and which is a likeness must be likely and duly corresponding with their subject: as being is to becoming, so is truth to belief. If then, Sokrates, after so many men have said divers things concerning the gods and the generation of the universe, we should not prove able to render an account everywhere and in all respects consistent and accurate, let no one be surprised; but if we can produce one as probable as any other, we must be content, remembering that I who speak and you my judges are but men: so that on these subjects we should be satisfied with the probable story and seek nothing further.

Socrates:: Quite right, Timaeus; we must accept it exactly as you say. Your prelude is exceedingly welcome to us, so please proceed with the strain itself.

Timaeus:: Let us declare then for what cause nature and this All was framed by him that framed it. He was good, and in none that is good can there arise jealousy of aught at any time. So being far aloof from this, he desired that all things should be as like unto himself as possible. This is that most sovereign cause of nature and the universe which we shall most surely be right in accepting from men of understanding. For God desiring that all things should be good, and that, so far as this might be, there should be nought evil, having received all that is visible not in a state of rest, but moving without harmony or measure, brought it from its disorder into order, thinking that this was in all ways better than the other. Now it neither has been nor is permitted to the most perfect to do aught but what is most fair. Therefore he took thought and perceived that of all things which are by nature visible, no work that is without reason will ever be fairer than that which has reason, setting whole against whole, and that without soul reason cannot dwell in anything. Because then he argued thus, in forming the universe he created reason in soul and soul in body, that he might be the maker of a work that was by nature most fair and perfect. In this way then we ought to affirm according to the probable account that this universe is a living creature in very truth possessing soul and reason by the providence of God.

Having attained thus far, we must go on to tell what follows: after the similitude of what animal its framer fashioned it. To none of these which naturally belong to the class of the partial must we deign to liken it: for nothing that is like to the imperfect could ever become fair; but that of which the other animals severally and in their kinds are portions, to this above all things we must declare that the universe is most like. For that comprehends and contains in itself all ideal animals, even as this universe contains us and all other creatures that have been formed to be visible. For since God desired to liken it most nearly to what is fairest of the objects of reason and in all respects perfect, he made it a single visible living being, containing within itself all animals that are by nature akin to it. Are we right then in affirming the universe to be one, or had it been more true to speak of a great and boundless number? One it must be, if it is to be created according to its pattern. For that which comprehends all ideal animals that are could never be a second in company of another: for there must again exist another animal comprehending them, whereof the two would be parts, and no longer to them but to that which comprehended them should we more truly affirm the universe to have been likened. To the end then that in its solitude this universe might be like the all-perfect animal, the maker made neither two universes nor an infinite number; but as it has come into being, this universe one and only-begotten, so it is and shall be for ever.

Now that which came into being must be material and such as can be seen and touched. Apart from fire nothing could ever become visible, nor without something solid could it be tangible, and solid cannot exist without earth: therefore did God when he set about to frame the body of the universe form it of fire and of earth. But it is not possible for two things to be fairly united without a third; for they need a bond between them which shall join them both. The best of bonds is that which makes itself and those which it binds as complete a unity as possible; and the nature of proportion is to accomplish this most perfectly. For when of any three numbers, whether expressing three or two dimensions, one is a mean term, so that as the first is to the middle, so is the middle to the last; and conversely as the last is to the middle, so is the middle to the first; then since the middle becomes first and last, and the last and the first both become middle, of necessity all will come to be the same, and being the same with one another all will be a unity. Now if the body of the universe were to have been made a plane surface having no thickness, one mean would have sufficed to unify itself and the extremes; but now since it behoved it to be solid, and since solids can never be united by one mean, but require two—God accordingly set air and water betwixt fire and earth, and making them as far as possible exactly proportional, so that fire is to air as air to water, and as air is to water water is to earth, thus he compacted and constructed a universe visible and tangible. For these reasons and out of elements of this kind, four in number, the body of the universe was created, being brought into concord through proportion; and from these it derived friendship, so that coming to unity with itself it became indissoluble by any force save the will of him who joined it.

Now the making of the universe took up the whole bulk of each of these four elements. Of all fire and all water and air and earth its framer fashioned it, leaving over no part nor power without. Therein he had this intent: first that it might be a creature perfect to the utmost with all its parts perfect; next that it might be one, seeing that nothing was left over whereof another should be formed; furthermore that it might be free from age and sickness; for he reflected that when hot things and cold and all such as have strong powers gather round a composite body from without and fall unseasonably upon it, they undermine it, and bringing upon it sickness and age cause its decay. For such motives and reasons he fashioned it as one whole, with each of its parts whole in itself, so as to be perfect and free from age and sickness. And he assigned to it its proper and natural shape. To that which is to comprehend all animals in itself that shape seems proper which comprehends in itself all shapes that are. Wherefore he turned it of a rounded and spherical shape, having its bounding surface in all points at an equal distance from the centre: this being the most perfect and regular shape; for he thought that a regular shape was infinitely fairer than an irregular. And all round about he finished off the outer surface perfectly smooth, for many reasons. It needed not eyes, for naught visible was left outside; nor hearing, for there was nothing to hear; and there was no surrounding air which made breathing needful. Nor must it have any organ whereby it should receive into itself its sustenance, and again reject that which was already digested; for nothing went forth of it nor entered in from anywhere; for there was nothing. For by design was it created to supply its own sustenance by its own wasting, and to have all its action and passion in itself and by itself: for its framer deemed that were it self-sufficing it would be far better than if it required aught else. And hands, wherewith it had no need to grasp aught nor to defend itself against another, he thought not fit idly to bestow upon it, nor yet feet, nor in a word anything to serve as the means of movement. For he assigned it that motion which was proper to its bodily form, of all the seven that which most belongs to reason and intelligence. Wherefore turning it about uniformly in the same spot on its own axis, he made it to revolve round and round; but all the six motions he took away from it and left it without part in their wanderings. And since for this revolution there was no need of feet he made it without legs and without feet.

So the universal design of the ever-living God, that he planned for the God that was some time to be, made its surface smooth and even, everywhere equally distant from the centre, a body whole and perfect out of perfect bodies. And God set soul in the midst thereof and spread her through all its body and even wrapped the body about with her from without, and he made it a sphere in a circle revolving, a universe one and alone; but for its excellence it was able to be company to itself and needed no other, being sufficient for itself as acquaintance and friend. For all these things then he created it a happy god.

But the soul was not made by God younger than the body, even as she comes later in this account we are essaying to give; for he would not when he had joined them together have suffered the elder to be governed by the younger: but we are far too prone to a casual and random habit of mind which shows itself in our speech. God made soul in birth and in excellence earlier and elder than body, to be its mistress and governor; and he framed her out of the following elements and in the following way. From the undivided and ever changeless substance and that which becomes divided in material bodies, of both these he mingled in the third place the form of Essence, in the midst between the Same and the Other; and this he composed on such wise between the undivided and that which is in material bodies divided; and taking them, three in number, he blended them into one form, forcing the nature of the Other, hard as it was to mingle, into union with the Same. And mingling them with Essence and of the three making one, again he divided this into as many parts as was meet, each part mingled of Same and of Other and of Essence. And he began his dividing thus: first he took one portion from the whole; then he went on to take a portion double of this; and the third half as much again as the second and triple of the first; the fourth double of the second; the fifth three times the third; the sixth eight times the first, the seventh twenty-seven times the first. After that, he filled up the interval between the powers of two and of three by severing yet more from the original mass and placing it between them in such a manner that within each interval were two means, the first exceeding one extreme in the same proportion as it was exceeded by the other, the second by the same number exceeding the one as it was exceeded by the other. And whereas by these links there were formed in the original intervals new intervals of $\frac{3}{2}$ and $\frac{4}{3}$ and $\frac{9}{8}$, he went on to fill up all the intervals of $\frac{4}{3}$ with that of $\frac{9}{8}$, leaving in each a fraction over; and the terms of the interval forming this fraction are in the numerical proportion of 256 to 243. By this time the mixture, whence he cut off these portions, was all used up. Next he cleft the structure so formed lengthwise into two halves, and laying the two so as to meet in the centre in the shape of the letter X, he bent them into a circle and joined them, causing them to meet themselves and each other at a point opposite to that of their original contact: and he comprehended them in the motion that revolves uniformly on the same axis, and one of the circles he made exterior and one interior. The exterior motion he named the motion of the Same, the interior that of the Other. And the circle of the Same he made revolve to the right by way of the side, that of the Other to the left by way of the diagonal. And he gave the supremacy to the motion of the same and uniform, for he left that single and undivided; but the inner circle he cleft into seven unequal circles in the proportion of the double and triple intervals severally, each being three in number; and he appointed that the circles should move in opposite directions, three at the same speed, the other four differing in speed from the three and among themselves, yet moving in a due ratio.

Now after that the framing of the soul was finished to the mind of him that framed her, next he fashioned within her all that is bodily, and he drew them together and fitted them middle to middle. And from the midst even unto the ends of heaven she was woven in everywhere and encompassed it around from without, and having her movement in herself she began a divine beginning of endless and reasonable life for ever and evermore. Now the body of the universe has been created visible; but she is invisible, and she, even soul, has part in reason and in harmony. And whereas she is made by the best of all whereunto belong reason and eternal being, so she is the best of all that is brought into being. Therefore since she is formed of the nature of Same and of Other and of Being, of these three portions blended, in due proportion divided and bound together, and turns about and returns into herself, whenever she touches aught that has manifold existence or aught that has undivided, she is stirred through all her substance, and she tells that wherewith the thing is same and that wherefrom it is different, and in what relation or place or manner or time it comes to pass both in the region of the changing and in the region of the changeless that each thing affects another and is affected. This word of hers is true alike, whether it deal with Same or with Other, without voice or sound in the Self-moved arising; and when she is busied with the sensible, and the Circle of the Other, being true, announces it throughout all the soul, then are formed sure opinions and true beliefs; and when she is busy with the rational, and the circle of the Same declares it, running smoothly, then ‘reason and knowledge cannot but be made perfect. And in whatsoever existing thing these two are found, if a man affirm it is aught but soul, what he says will be anything rather than the truth.

And when the father who begat it perceived the created image of the eternal gods, that it had motion and life, he rejoiced and was well pleased; and he bethought him to make it yet more nearly like its pattern. Now whereas that is a living being eternally existent, even so he essayed to make this All the like to the best of his power. Now so it was that the nature of the ideal was eternal. But to bestow this attribute altogether upon a created thing was impossible; so he bethought him to make a moving image of eternity, and while he was ordering the universe he made of eternity that abides in unity an eternal image moving according to number, even that which we have named time. For whereas days and nights and months and years were not before the universe was created, he then devised the generation of them along with the fashioning of the universe. Now all these are portions of time, and *was* and *shall be* are forms of time that have come to be, although we wrongly ascribe them unawares to the eternal essence. For we say that it was and is and shall be, but in verity is alone belongs to it: and was and shall be it is meet should be applied only to Becoming which moves in time; for these are motions. But that which is ever changeless without motion must not become elder or younger in time, neither must it have become so in the past nor be so in the future; nor has it to do with any attributes that Becoming attaches to the moving objects of sense: these have come into being as forms of time, which is the image of eternity and revolves according to number. Moreover we say that the become *is* the become, and the becoming *is* the becoming, and that which shall become is that which shall become, and not-being-*is* not-being. In all this we speak incorrectly. But concerning these things the present were perchance not the right season to inquire particularly.

Time then has come into being along with the universe, that being generated together, together they may be dissolved, should a dissolution of them ever come to pass; and it was made after the pattern of the eternal nature, that it might be as like to it as was possible. For the pattern is existent for all eternity; but the copy has been and is and shall be throughout all time continually. So then this was the plan and intent of God for the generation of time; the sun and the moon and five other stars which have the name of planets have been created for defining and preserving the numbers of time. And when God had made their several bodies, he set them in the orbits wherein the revolution of the Other was moving, in seven circles seven stars. The moon he placed in that nearest the earth, and in the second above the earth he set the sun; and the morning-star and that which is held sacred to Hermes he assigned to those that moved in an orbit having equal speed with the sun, but having a contrary tendency: wherefore the sun and Hermes and the morning star in like manner overtake and are overtaken one by another. And as to the rest, were we to set forth all the orbits wherein he put them and the causes wherefore he did so, the account, though only by the way, would lay on us a heavier task than that which was our chief object in giving it. These things perhaps may hereafter, when we have leisure, find a fitting exposition.

But when each of the beings which were to join in creating time had arrived in its proper orbit, and had been generated as animate creatures, their bodies secured with living bonds, and had learnt their appointed task; then in the motion of the Other, which was slanting and crossed the motion of the Same and was thereby controlled, whereas one of these planets had a larger, another a smaller circuit, the lesser orbit was completed more swiftly, the larger more slowly: but because of the motion of the Same those which revolved most swiftly seemed to be overtaken by those that went more slowly, though really they overtook them. For the motion of the Same, twisting all their circles into spirals, because they have a separate and simultaneous motion in the opposite way, being of all the swiftest displays closest to itself that which departs most slowly from it. And that there might be some clear measure of the relative swiftness and slowness with which they moved in their eight revolutions, God kindled a light in the second orbit from the earth, which we now have named the sun, in order that it might shine most brightly to the ends of heaven, and that living things, so many as was meet, should possess number, learning it from the motion of the same and uniform. Night then and day have been created in this manner and for these causes; and this is one revolution of the undivided and most intelligent circuit; and a month is fulfilled when the moon, after completing her own orbit, overtakes the sun; a year, when the sun has completed his own course. But the courses of the others men have not taken into account, save a few out of many; and they neither give them names nor measure them against one another, comparing them by means of numbers—nay I may say they do not know that time arises from the wanderings of these, which are incalculable in multitude and marvellously intricate. None the less however can we observe that the perfect number of time fulfils the perfect year at the moment when the relative swiftnesses of all the eight revolutions accomplish their course together and reach their starting-point, being measured by-the circle of the same and uniformly moving. In this way then and for these causes were created all such of the stars as wander through the heavens and turn about therein, in order that this universe may be most like to the perfect and ideal animal by its assimilation to the eternal being.

Now up to the generation of time all else had been accomplished in the likeness of that whereunto it was likened: but in that it did not yet contain all living creatures created within it, herein it was still unlike. So he went on to complete this that remained unfinished, moulding it after the nature of the pattern. So many forms then as Mind perceived to exist in the ideal animal, according to their variety and multitude, such kinds and such a number did he think fit that this universe should possess. These are fourfold: first the race of the heavenly gods, next the winged tribe whose path is in the air, third whatso dwells in the water, and fourth that which goes upon dry land. The visible form of the deities he created chiefly of fire, that it might be most radiant and most fair to behold; and likening it to the All he shaped it like a sphere and assigned it to the intelligence of the supreme to follow after it; and he disposed it throughout all the firmament of heaven, to be an adornment of it in very truth, wrought cunningly over the whole expanse. And he bestowed two movements upon each, one in the same spot and uniform, whereby it should be ever constant to its own thoughts concerning the same thing; the other forward, but controlled by the revolution of the same and uniform: but for the other five movements he made it motionless and still, that each star might attain the highest completeness of perfection. From which cause have been created all the stars that wander not but abide fast for ever, living beings divine and eternal and in one spot revolving: while those that move in a circle and wander as aforesaid have come into being on those principles which in the foregoing we have declared.

And the earth our foster-mother, that is' globed round the axis stretched from pole to pole of the universe, her he fashioned to be the guardian and creator of night and day, the first and most august of the gods that have been created within the heavens. But the circlings of them and their crossings one of another, and the manner of the returning of their orbits upon themselves and their approximations, and which of the deities meet in their conjunctions and which are in opposition, and how they pass before and behind each other, and at what times they are hidden from us and again reappearing send to them who cannot calculate their motions panics and portents of things to come—to declare all this without visible illustrations of their very movements were labour lost. So let thus much suffice on this head and let our exposition concerning the nature of the gods visible and created be brought to an end.

But concerning the other divinities, to declare and determine their generation were a task too mighty for us: therefore we must trust in those who have revealed it heretofore, seeing that they are offspring, as they said, of gods, and without doubt know their own forefathers. We cannot then mistrust the children of gods, though they speak without probable or inevitable demonstrations; but since they profess to announce what pertains to their own kindred, we must conform to usage and believe them. Let us then accept on their word this account of the generation of these gods. Of Earth and Heaven were born children, Okeanos and Tethys; of these Phorkys and Kronos and Rhea and all their brethren: and of Kronos and Rhea, Zeus and Hera and all whom we know to be called their brothers; and they in their turn had children after them.

Now when all the gods had come to birth, both those who revolve before our eyes and those who reveal themselves in so far as they will, he who begat this universe spake to them these words: Gods of gods, whose creator am I and father of works, which by me coming into being are indissoluble save by my will: Behold, all which hath been fastened may be loosed, yet to loose that which is well fitted and in good case were the will of an evil one. Wherefore, forasmuch as ye have come into being, immortal ye are not, nor indissoluble altogether; nevertheless shall ye not be loosed nor meet with the doom of death, having found in my will a bond yet mightier and more sovereign than those that ye were bound withal when ye came into being. Now therefore hearken to the word that I declare unto you. Three kinds of mortal beings are yet uncreate. And if these be not created, the heaven will be imperfect; for it will not have within it all kinds of living things; yet these it must have, if it is to be perfect. But if these were created by my hands and from me received their life, they would be equal to gods. Therefore in order that they may be mortal, and that this All may be truly all, turn ye according to nature unto the creation of living things, imitating my power that was put forth in the generation of you. Now such part of them as is worthy to share the name of the immortals, which is called divine and governs in the souls of those that are willing ever to follow after justice and after you, this I, having sown and provided it, will deliver unto you: and ye for the rest, weaving the mortal with the immortal, shall create living beings and bring them to birth, and giving them sustenance shall ye increase them, and when they perish receive them back again.

Thus spake he; and again into the same bowl wherein he mingled and blended the universal soul he poured what was left of the former, mingling it somewhat after the same manner, yet no longer so pure as before but second and third in pureness. And when he had compounded the whole, he portioned off souls equal in number to the stars and distributed a soul to each star, and setting them in the stars as though in a chariot, he shewed them the nature of the universe and declared to them its fated laws; how that the first incarnation should be ordained to be the same for all, that none might suffer disadvantage at his hands; and how they must be sown into the instruments of time, each into that which was meet for it, and be born as the most god-fearing of all living creatures; and whereas human nature was twofold, the stronger was that race which should hereafter be called man. When therefore they should be of necessity implanted in bodily forms, and of their bodies something should ever be coming in and other passing away, in the first place they must needs all have innate one and the same faculty of sense, arising from forcible affections; next love mingled with pleasure and pain; and besides these fear and wrath and all the feelings that accompany these and such as are of a contrary nature: and should they master these passions, they would live in righteousness; if otherwise, in unrighteousness. And he who lived well throughout his allotted time should be conveyed once more to a habitation in his kindred star, and there should enjoy a blissful and congenial life: but failing of this, he should pass in the second incarnation into the nature of a woman; and if in this condition he still would not turn from the evil of his ways, then, according to the manner of his wickedness, he should ever be changed into the nature of some beast in such form of incarnation as fitted his disposition, and should not rest from the weariness of these transformations, until by following the revolution that is within him of the same and uniform, he should overcome by reason all that burden that afterwards clung around him of fire and water and air and earth, a troublous and senseless mass, and should return once more to the form of his first and best nature.

And when he had ordained all these things for them, to the end that he might be guiltless of all the evil that should be in each of them, God sowed some in the earth, some in the moon, and some in the other instruments of time. And what came after the sowing he gave into the hands of the young gods, to mould, mortal bodies, and having wrought all the residue of human soul that needed yet to be added, to govern and guide as nobly and perfectly as they could the mortal creature, in so far as it brought not evil upon its own head.

So when he had made all these ordinances for them God was abiding after the manner of his own nature: and as he so abode, the children thinking on the command of their father were obedient to it, and having received the immortal principle of a mortal creature, imitating their own artificer, they borrowed from the universe portions of fire and of earth and of water and of air, on condition that they should be returned again, and they cemented together what they took, not with the indissoluble bonds wherewithal they themselves were held together, but welding it with many rivets, invisible for smallness, and making of all the elements one body for each creature, they confined the revolutions of the immortal soul in a body in flowing and out-flowing continually. And they, being confined in a great river, neither controlled it nor were controlled, but bore and were borne violently to and fro; so that the whole creature moved, but advanced at random without order or method, having all the six motions: for they moved forward and backward and again to right and to left and downward and upward, and in every way went straying in the six directions. For great as was the tide sweeping over them and flowing off which brought them sustenance, a yet greater tumult was caused by the effects of the bodies that struck against them; as when the body of any one came in contact with some alien fire that met it from without, or with solid earth, or with liquid glidings of water, or if he were caught in a tempest of winds borne on the air, and so the motions from all these elements rushing through the body penetrated to the soul. This is in fact the reason why these have all alike been called and still are called sensations (αισθησεις). Then too did they produce the most wide and vehement agitation for the time being, joining with the perpetually streaming current in stirring and violently shaking the revolutions of the soul, so that they altogether hindered the circle of the Same by flowing contrary to it, and they stopped it from governing and from going; while the circle of the Other they displaced, so that the double and triple intervals, being three of each sort, and the means and junctures of $\frac{3}{2}$ and $\frac{4}{3}$ and $\frac{9}{8}$, since they could not be utterly undone save by him that joined them, were forced by them to turn in all kinds of ways and to admit all manner of breaking and twisting of the circles, in every possible form, so that they can barely hold to one another, and though they are in motion, it is motion without law, sometimes reversed, now slanting, and now inverted. It is as though a man should stand on his head, resting it on the earth and supporting his feet against something aloft; in this case the man in such condition and the spectators would reciprocally see right and left reversed in the persons of each other. The same and similar effects are produced with great intensity in the soul's revolutions: and when from external objects there meets them anything that belongs to the class of the Same or to that of the Other, then they declare its relative sameness or difference quite contrariwise to the truth, and show themselves false and irrational; and no circuit is governor or leader in them at that time. And whenever sensations from without rushing up and falling upon them drag along with them the whole vessel of the soul, then the circuits seem to govern though they really are governed. On account then of all these experiences the soul is at first bereft of reason, now as in the beginning, when she is confined in a mortal body. But when the stream of growth and nutriment flows in with smaller volume, and the revolutions calming down go their own way and become settled as time passes on, then the orbits are reduced to the form that belongs to the several circles in their natural motion, and declaring accurately the Other and the Same, they set their possessor in the way to become rational. And if any just discipline of education help this process, he becomes whole altogether without a blemish, having made his escape from the most grievous of plagues; but if he neglect it, he passes the days of his life halt and maimed, and unhallowed and unreasonable he comes again to Hades. These things however belong to a later time: we must discuss more exactly the subject immediately before us. And as to the matters which are previous to this, concerning the generation of the body in all its parts and concerning soul, and the reasons and designs of the gods whereby they have come into being, we must cling to the most probable theory, and by proceeding in this way so give an account of all.

Imitating the shape of the universe, which was spherical, they confined the two divine revolutions in a globe-shaped body, the same that we now call the head, which is the divinest part of us and has dominion over all our members. To this the gods gave the whole body, when they had put it together, to minister to it, reflecting that it possessed all the motions that should be. In order then that it might not have to roll upon the earth, which has hills and hollows of all kinds, nor be at a loss to surmount the one and climb out of the other, they gave it the body for a conveyance and for ease of going: whence the body was endowed with length and grew four limbs that could be stretched and bent, which the god devised for it to go withal, and by means of which clinging and supporting itself it is enabled to pass through every place, bearing at the top of us the habitation of the most divine and sacred element. In this way then and for these reasons were legs and hands added to all mankind; and the gods, deeming that the front was more honourable than the back and more fit to lead, made us to move for the most part in this direction. So it behoved man to have the front part distinguished and unlike the back. Therefore having set the face upon the globe of the head on that side, they attached to it organs for all the forethought of the soul, and they ordained that this which had the faculty of guidance should be by nature the front. And first of the organs they wrought light-giving eyes, which they fixed there on the plan I shall explain. Such sort of fire as had the property of yielding a gentle light but not of burning, they contrived to form into a substance akin to the light of every day. The fire within us, which is akin to the daylight, they made to flow pure smooth and dense through the eyes, having made close the whole fabric of the eyes and especially the pupils, so that they kept back all that was coarser and suffered only this to filter through unmixed and pure. Whenever then there is daylight surrounding the current of vision, then this issues forth as like into like, and coalescing with the light is formed into one uniform substance in the direct line of vision, wherever the stream issuing from within strikes upon some external object that falls in its way. So the whole from its uniformity becomes sympathetic; and whenever it comes in contact with anything else, or anything with it, it passes on the motions thereof over the whole body until they reach the soul, and thus causes that sensation which we call seeing. But when its kindred fire departs into night, the visual current is cut off: for issuing into an alien element it is itself changed and quenched, having no longer a common nature with the surrounding air, which has in it no fire. Therefore it ceases from seeing and moreover becomes an allurement to sleep. For the gods had devised as a safeguard of the sight the structure of the eyelids; and when these are closed, they shut up the force of fire within; and this smoothes and calms the motions within; and when these are calmed, quiet ensues. And if the quiet is profound, sleep with few dreams falls on us; but if some of the stronger motions are left, according to their nature and the places where they remain, they engender visions corresponding in kind and in number; which are images within us, and when we awake are remembered as outside us. Now the explanation of reflections in mirrors and all bright smooth surfaces is no longer hard to discern. For because of the communion of the internal and external fire, which again is united on the smooth surface and in manifold ways deflected, all these reflections take place; the fire that belongs to the face coalescing with the fire of the visual current upon the surface of the smooth bright object. And left appears right and right left, because mutually opposite particles of the visual current and of the object seen come into contact, contrary to the wonted mode of collision. On the other hand right appears as right and left as left, when in the act of combination with that wherewith it combines the ray changes sides. This happens when the smooth surface of the mirror is curved upwards on each side and so throws the right portion of the visual current to the left side and the converse. But if it is turned lengthwise to the face, it makes this same reflection appear completely upside down, thrusting the lower portion of the ray to the upper end and the upper to the lower.

All these things are among the secondary causes which God uses to serve him in carrying out the idea of the best so far as is possible. But the multitude regard them not as secondary but as primary causes, which act by cooling and heating, condensing and rarefying, and all such processes.

Yet they are incapable of all reason or thought for any purpose. For the only existing thing to which belongs the possession of reason we must affirm to be soul: and this is invisible, whereas fire and water and air and earth are all visible creations. Now the lover of reason and knowledge must first seek for the causes which belong to the rational order; and only in the second place those which belong to the class of things which are moved by others and move others in turn. This then is what we must also do: we must declare both classes of causes, distinguishing between those which with the aid of reason are the creators of fair things and good, and those which being destitute of reason produce from time to time chance effects without design. Enough then of the auxiliary causes which combine in giving the eyes the power they now possess; but the great result, for the sake of which God bestowed them on us, must be our next theme. Sight, according to my judgment, has been the cause of the greatest blessing to us, inasmuch as of our present discourse concerning the universe not one word would have been uttered had we never seen the stars and the sun and the heavens. But now day and night, being seen of us, and months and the revolution of the years have created number, and they gave us the notion of time and the power of searching into the nature of the All; whence we have derived philosophy, than which no greater good has come neither shall come hereafter as the gift of heaven to mortal man. This I declare to be the chiefest blessing due to the eyes: on the rest that are meaner why should we descant? let him who loves not wisdom, if he be blinded of these, lament with idle moan. But on our part let this be affirmed to be the cause of vision, for these ends: God discovered and bestowed sight upon us in order that we might observe the orbits of reason which are in heaven and make use of them for the revolutions of thought in our own souls, which are akin to them, the troubled to the serene; and that learning them and acquiring natural truth of reasoning we might imitate the divine movements that are ever unerring and bring into order those within us which are all astray. And of sound and hearing again the same account must be given: to the same ends and with the same intent they have been bestowed on us by the gods. For not only has speech been appointed for this same purpose, whereto it contributes the largest share, but all such music as is expressed in sound has been granted, for the sake of harmony: and harmony, having her motions akin to the revolutions in our own souls, has been bestowed by the Muses on him who with reason seeks their help, not for any senseless pleasure, such as is now supposed to be its chiefest use, but as an ally against the discord which has grown up in the revolution of our soul, to bring her into order and into unison with herself: and rhythm too, because our habit of mind is mostly so faulty of measure and lacking in grace, is a succor bestowed on us by the same givers for the same ends.

Now in our foregoing discourse, with few exceptions, we have been declaring the creations wrought through mind: we must now set by their side those things which come into being through necessity. For the generation of this universe was a mixed creation by a combination of necessity and reason. And whereas reason governed necessity, by persuading her to guide the greatest part of created things to the best end, on such conditions and principles, through necessity overcome by reasonable persuasion, this universe was fashioned in the beginning. If then we would really declare its creation in the manner whereby it has come to be, we must add also the nature of the Errant Cause, and its moving power. Thus then let us return upon our steps, and when we have found a second fitting cause for the things aforesaid, let us once more, proceeding in the present case as we did in the former, begin over again from the beginning. Now we must examine what came before the creation of the heavens, the very origin of fire and water and air and earth, and the conditions that were before them. For now no one has declared the manner of their generation; but we speak as if men knew what is fire and each of the others, and we treat them as beginnings, as elements of the whole; whereas by one who has ever so little intelligence they could not plausibly be represented as belonging even to the class of syllables. Now however let our say thus be said. The first principle or principles or whatever we may hold it to be which underlies all things we must not declare at present, for no other reason but that it is difficult according to the present method of our exposition to make clear our opinion. You must not then deem that I ought to discourse of this, nor could I persuade myself that I should be right in essaying so mighty a task. But holding fast the principle we laid down at the outset, the value of a probable account, I will strive to give an explanation that is no less probable than another, but more so; returning back to describe from the beginning each and all things. So now again at the outset of our quest let us call upon God to pilot us safe through a strange and unfamiliar discourse to the haven of probability; and thus let us begin once more.

Our new exposition of the universe then must be founded on a fuller classification than the former. Then we distinguished two forms, but now a third kind must be disclosed. The two were indeed enough for our former discussion, when we laid down one form as the pattern, intelligible and changeless, the second as a copy of the pattern, which comes into being and is visible. A third we did not then distinguish, deeming that the two would suffice: but now, it seems, by constraint of our discourse we must try to express and make manifest a form obscure and dim. What power then must we conceive that nature has given it? something like this. It is the receptacle, and as it were the nurse, of all becoming. This saying is true, but we must put it in clearer language: and this is hard; especially as for the sake of it we must needs inquire into fire and the substances that rank with fire. For it is hard to say which of all these we ought to call water any more than fire, or indeed which we ought to call by any given name, rather than all and each severally, in such a way as to employ any truthful and trustworthy mode of speech. How then are we to deal with this point, and what is the question that we should properly raise concerning it? In the first place, what we now have named water, by condensation, as we suppose, we see turning to stones and earth; and by rarefying and expanding this same element becomes wind and air; and air when inflamed becomes fire: and conversely fire contracted and quenched returns again to the form of air; also air concentrating and condensing becomes cloud and mist; and from these yet further compressed comes flowing water; and from water earth and stones once more: and so, it appears, they hand on one to another the cycle of generation. Thus then since these several bodies never assume one constant form, which of them can we positively affirm to be really this and not another without being shamed in our own eyes? It cannot be: it is far the safest course when we make a statement concerning them to speak as follows. What we see in process of perpetual transmutation, as for instance fire, we must not call this, but suck-like is the appellation we must confer on fire; nor must we call water this, but always such; nor must we apply to anything, as if it had any stability, such predicates as we express by the use of the terms this and that and suppose that we signify something thereby. For it flees and will not abide such terms as this and that and relative to this, and every phrase which represents it as stable. The word this we must not use of any of them; but such, applying in the same sense to all their mutations, we must predicate of each and all: fire we must call that which universally has that appearance; and so must we name all things such as come into being. That wherein they come to be severally and show themselves, and from whence again they perish, in naming that alone must we use the words that and this; but whatever has any quality, such as white or hot or any of two opposite attributes, and all combinations of these, we must denote by no such term.

But we must try to speak yet more clearly on this matter. Suppose a man having molded all kinds of figures out of gold should unceasingly remold them, interchanging them all with one another, it were much the safest thing in view of truth to say that it is gold; but as to the triangles or any other shapes that were impressed on it, never to speak of them as existing, seeing that they change even as we are in the act of defining them; but if it will admit the term such with any tolerable security, we must be content. The same language must be applied to the nature which receives into it all material things: we must call it always the same; for it never departs from its own function at all. It ever receives all things into it and has nowhere any form in any wise like to aught of the shapes that enter into it. For it is as the substance wherein all things are naturally molded, being stirred and informed by the entering shapes; and owing to them it appears different from time to time. But the shapes which pass in and out are likenesses of the eternal existences, being copied from them in a fashion wondrous and hard to declare, which we will follow up later on. For the present however we must conceive three kinds: first that which comes to be, secondly that wherein it comes to be, third that from which the becoming is copied when it is created. And we may liken the recipient to a mother, the model to a father, and that which is between them to a child; and we must remember that if a molded copy is to present to view all varieties of form, the matter in which it is molded cannot be rightly prepared unless it be entirely bereft of all those forms which it is about to receive from without. For were it like any one of the entering shapes, whenever that of an opposite or entirely different nature came upon it, it would in receiving it give the impression badly, intruding its own form. Wherefore that which shall receive all forms within itself must be utterly without share in any of the forms; just as in the making of sweet unguents, men purposely contrive, as the beginning of the work, to make the fluids that are to receive the perfumes perfectly scentless: and those who set about moulding figures in any soft substance do not suffer any shape to show itself therein at the beginning, but they first knead it smooth and make it as uniform as they can. In the same way it behoves that which is fitly to receive many times over its whole extent likenesses of all things, that is of all eternal existences, to be itself naturally without part or lot in any of the forms. Therefore the mother and recipient of creation which is visible and by any sense perceptible we must call neither earth nor air nor fire nor water, nor the combinations of these nor the elements of which they are formed: but we shall not err in affirming it to be a viewless nature and formless, all-receiving, in some manner most bewildering and hard to comprehend partaking of the intelligible. But so far as from what has been said we may arrive at its nature, this would be the most just account of it. That part of it which is enkindled from time to time appears as fire, and that which is made liquid as water, and as earth and air such part of it as receives the likenesses of these.

But in our inquiry concerning these we must deliver a stricter statement. Is there an absolute idea of fire, and do all those absolute ideas exist to which in every case we always ascribe absolute being? Or do those things which we actually see or perceive with any other bodily sense alone possess such reality? and is it true that there are no manner of real existences beyond these at all, but we talk idly when we speak of an intelligible idea as actually existent, whereas it was nothing but a conception? Now it does not become us either to dismiss the present question unjudged and undecided, simply asserting that the ideas exist, nor yet must we add to our already long discourse another as long which is subordinate. But if we could see our way to a great definition couched in brief words, that would be most seasonable for our present purpose. Thus then do I give my own verdict: if reason and true opinion are of two different kinds, then the ideas do surely exist, forms not perceptible by our senses, the objects of thought alone; but if, as some hold, true opinion differs nothing from reason, then all that we apprehend by our bodily organs we must affirm to be the most real existence. Now we must declare them to be two, because they are different in origin and unlike in nature. The one is engendered in us by instruction, the other by persuasion; the one is ever accompanied by right understanding, the other is without understanding; the one is not to be moved by persuasion, the other yields to persuasion; true opinion we must admit is shared by all men, but reason by the gods alone and a very small portion of mankind. This being so, we must agree that there is first the unchanging idea, unbegotten and imperishable, neither receiving aught into itself from without nor itself entering into aught else, invisible, nor in any wise perceptible—even that whereof the contemplation belongs to thought. Second is that which is named after it and is like to it, sensible, created, ever in motion, coming to be in a certain place and again from thence perishing, apprehensible by opinion with sensation. And the third kind is space everlasting, admitting not destruction, but affording place for all things that come into being, itself apprehensible without sensation by a sort of bastard reasoning, hardly matter of belief. It is with this in view that dreaming we say that all which exists must be in some place and filling some space, and that what is neither on earth nor in heaven anywhere is nought. All these and many kindred fancies have we even concerning that unsleeping essence and truly existing, for that by reason of this dreaming state we become impotent to arouse ourselves and affirm the truth; namely, that to an image it belongs, seeing that it is not the very model of itself, on which itself has been created, but is ever the fleeting semblance of another, in another to come into being, clinging to existence as best it may, on pain of being nothing at all; but to the really existent essence reason in all exactness true comes as an ally, declaring that so long as one thing is one and another thing is other, neither of them shall come to be in the other, so that the same becomes at once one and two.

Such then is the statement for which I give my sentence, as we have briefly reasoned it out: that there are Being and Space and Becoming, three in number with threefold nature, even before the heavens were created. And the nurse of becoming, being made liquid and fiery and putting on the forms of earth and air, and undergoing all the conditions that attend thereupon, displays to view all manner of semblances; and because she is filled with powers that are not similar nor equivalent, she is at no part of her in even balance, but being swayed in all directions unevenly, she is herself shaken by the entering forms, and by her motion shakes them again in turn: and they, being thus stirred, are carried in different directions and separated, just as by sieves and instruments for winnowing corn the grain is shaken and sifted, and the dense and heavy parts go one way, and the rare and light are carried to a different place and settle there. Even so when the four kinds are shaken by the recipient, which by the motion she has received acts as an instrument for shaking, she separates the most dissimilar elements furthest apart from one another, and the most similar she draws chiefly together; for which cause these elements had different regions even before the universe was ordered out of them and created. Before that came to pass all these things were without method or measure; but when an essay was being made to order the universe, first fire and water and earth and air, which had certain vestiges of their own nature, yet were altogether in such a condition as we should expect for everything when God is not in it, being by nature in the state we have said, were then first by the creator fashioned forth with forms and numbers. And that God formed them to be most fair and perfect, not having been so heretofore, must above all things be the foundation whereon our account is for ever based. But now the disposition of each and their generation is what. I must strive to make known to you in speech unwonted: but seeing ye are no strangers to the paths of learning, through which my sayings must be revealed to you, ye will follow me.

In the first place, that fire and earth and water and air are material bodies is evident to all. Every form of body has depth: and depth must be bounded by plane surfaces. Now every rectilinear plane is composed of triangles. And all triangles are derived from two triangles, each having one right angle and the others acute: and one triangle has on each side a moiety of a right angle marked off by equal sides, the other has it divided into unequal parts by unequal sides. These we conceive to be the basis of fire and the other bodies, following up the probable account which is concerned with necessity: but the principles yet more remote than these are known but to God and to whatsoever man is a friend of God. Now we must declare what are the four fairest bodies that could be created, unlike one another, but capable, some of them, of being generated out of each other by their dissolution: for if we succeed in this, we have come at the truth concerning earth and fire and the intermediate proportionals. For we will concede to no one that there exist any visible bodies fairer than these, each after its own kind. We must do our diligence then to put together these four kinds of bodies most excellent in beauty, and so we shall say that we have a full comprehension of their nature.

Now of the two triangles the isosceles has but one kind, but the scalene an endless number. Out of this infinite multitude then we must choose the fairest, if we are to begin upon our own principles. If then any man can tell of a fairer kind that he has selected for the composition of these bodies, it is no enemy but a friend who vanquishes us: however of all these triangles we declare one to be the fairest, passing over the rest; that namely of which two conjoined form an equilateral triangle. The reason it were too long to tell: but if any man convict us in this and find that it is not so, the palm is ready for him with our right good will. Let then two triangles be chosen whereof the substance of fire and of the other elements has been wrought; the one isosceles, the other always having the square on the greater side three times the square on the lesser. And now we must more strictly define something which we expressed not quite clearly enough before. For it appeared as though all the four classes had generation through each other and into each other, but this appearance was delusive. For out of the triangles we have chosen arise four kinds, three from one of them, that which has unequal sides, and the fourth one alone composed of the isosceles triangle. It is not then possible for all of them by dissolution to pass one into another, a few large bodies being formed of many small, and the converse: but for three of them it is possible. For since they all arise from one basis, when the larger bodies are broken up, a number of small ones will be formed from the same elements, putting on the shapes proper to them; and again when a number of small bodies are resolved into their triangles, they will become one in number and constitute a single large body of a different form. So much for their generation into one another: the next thing will be to say what is the form in which each has been created, and by the combination of what numbers. We will begin with the form which is simplest and smallest in its construction. Its element is the triangle which has the hypotenuse double of the shorter side in length. If a pair of these are put together so that their hypotenuses coincide, and this is done three times, in such a way that the hypotenuses and the shorter sides meet in one point as a centre, thus one equilateral triangle has been formed out of the other six triangles: and if four equilateral triangles are combined, so that three plane angles meet in a point, they make at each point one solid angle, that which comes immediately next to the most obtuse of plane angles; and when four such angles are produced there is formed the first solid figure, dividing its whole surface into four equal and similar parts. The second is formed of the same triangles in sets of eight equilateral triangles, bounding every single solid angle by four planes; and with the formation of six such solid angles the second figure is also complete. The third is composed of 120 of the elementary triangles united, and of twelve solid angles, each contained by five plane equilateral triangles; and it has twenty equilateral surfaces. And the first element, when it had generated these figures, had done its part: the isosceles triangle generated the fourth, combined in sets of four, with the right angles meeting at the centre, thus forming a single square. Six of these squares joined together formed eight solid angles, each produced by three plane right angles: and the shape of the body thus formed was cubical, having six square planes for its surfaces. And whereas a fifth figure yet alone remained, God used it for the universe in embellishing it with signs.

Now if any man, reflecting upon all these things, should fairly ask himself whether the number of cosmic systems is indefinite or definite, he would deem that to believe them indefinite was the opinion of one who thought very indefinitely on a matter where he ought to be most definitely informed: but whether we ought to say that there is but one, or that there are really in nature five, he might, if he stopped short there, with more justice feel doubtful. Our verdict declares that according to the probable theory it is by nature one; another however, looking to some other guide, may have a different view. But no more of him; let us assign the figures that have come into being in our theory to fire and earth and water and air. To earth let us give the cubical form; for earth is least mobile of the four and most plastic of bodies: and that substance must possess this nature in the highest degree which has its bases most stable. Now of the triangles which we assumed as our starting-point that with equal sides is more stable than that with unequal; and of the surfaces composed of the two triangles the equilateral quadrangle necessarily is more stable than the equilateral triangle, both in its parts and as a whole. Therefore in assigning this to earth we preserve the probability of our account; and also in giving to water the least mobile and to fire the most mobile of those which remain; while to air we give that which is intermediate. Again we shall assign the smallest figure to fire, and the largest to water and the intermediate to air: and the keenest to fire, the next to air, and the third to water. Now among all these that which has the fewest bases must naturally in all respects be the most cutting and keen of all, and also the most nimble, seeing it is composed of the smallest number of similar parts; and -the second must have these same qualities in the second degree, and the third in the third degree. Let it be determined then, according to the right account and the probable, ‘that the solid body which has taken the form of the pyramid is the element and seed of fire; and the second in order of generation let us say to be that of air, and the third that of water. Now all these bodies we must conceive as being so small that each single body in the several kinds cannot for its smallness be seen by us at all; but when many are heaped together, their united mass is seen: and we must suppose that the due proportion in respect of their multitude and motions and all their other powers, when God had completed them with all perfection, in so far as the nature of necessity, consenting and yielding to persuasion, suffered, were everywhere by him ordained in fitting measure.

From all that we have already said in the matter of these four kinds, the facts would seem to be as follows. When earth meets with fire and is dissolved by the keenness of it, it would drift about, whether it were dissolved in fire itself, or in some mass of air or water, until the parts of it meeting and again being united became earth once more; for it never could pass into any other kind. But when water is divided by fire or by air, it may be formed again and become one particle of fire and two of air: and the divisions of air may become for every particle broken up two particles of fire. And again when fire is caught in air or in waters or in earth, a little in a great bulk, moving amid a rushing body, and contending with it is vanquished and broken up, two particles of fire combine into one figure of air: and when air is vanquished and broken small, from two whole and one half particle one whole figure of water will be composed. Let us also reckon it once again thus: when any of the other kinds is intercepted in fire and is divided by it through the sharpness of its angles and its sides, if it forms into the shape of fire, it at once ceases from being divided: for a kind which is uniform and identical, of whatever sort it be, can neither be the cause of any change nor can it suffer any from that which is identical and uniform with itself; but so long as passing into another kind a lesser bulk contends with the greater, it ceases never from being broken. And when the smaller figures few in number are caught in a multitude of larger figures and are being broken in pieces and quenched, if they consent to combine into the form of the stronger they then and there cease from being quenched; and from fire arises air, from air water. But if they assail the others, and another sort meet and contend with them, they cease not from being shattered until, being entirely repelled and dissolved, they find refuge with some of their own kind, or being overcome, form from many of their own figures one similar to the victorious element, and there remain and abide with it. Moreover on account of these conditions they all are changing their places; for the bulk of every kind are sorted into separate regions of their own through the motion of the recipient: and those which are altered from their own nature and made like some other are carried by reason of this movement to the region proper to the element to which they are assimilated.

All unmixed and primary bodies have thus come into being through the causes we have described: but for the fact that within the several classes different kinds exist we must assign as its cause the structure of the elementary triangles; it does not originally produce in each kind of triangle one and the same size only, but some greater and some less; and there are just so many sizes as there are kinds in the classes: and when these are mixed up with themselves or with one another, an endless diversity arises, which must be examined by those who would put forward a probable theory concerning nature.

Now concerning rest and motion, how they arise and under what conditions, we must come to an agreement, else many difficulties will stand in the way of our argument that is to follow. This has been already in part set forth, but we have yet to add that in uniformity no movement will ever exist. For that what is to be moved should exist without that which is to move it, or what is to move without that which is to be moved, is, difficult or rather impossible: but without these there can be no motion, and for these to be uniform is not possible. So then let us always assign rest to uniformity and motion to its opposite. Now the opposite of uniformity is caused by inequality; and of inequality we have discussed the origin. But how it comes to pass that all bodies are not sorted off into their several kinds and cease from passing through one another and changing their place, this we have not explained. Let us put it again in this way. The revolution of the whole, when it had embraced the four kinds, being circular, with a natural tendency to return upon itself, compresses everything and suffers no vacant space to be left. Therefore fire penetrates most of all through all things, and in the second degree air, since it is second in fineness, and the rest in proportion. For the substances which are formed of the largest parts have the most void left in their structure, and those made of the smallest have the least. Now the constriction of this contracting force thrusts the small particles into the interspaces between the larger: so that when small are set side by side with great, and the lesser particles divide the greater, while the greater compress the smaller, all things keep rushing backwards and forwards to their own region; since in changing its bulk each changes its proper position in space. Thus owing to these causes a perpetual disturbance of uniformity is always kept up and so preserves the perpetual motion of matter now and henceforth without cessation.

Next we must remember that of fire there are many kinds: for instance flame and that effluence from flame, which burns not but gives light to the eyes, and that which remains in the embers when the flame is out. And so with air: the purest is that which is called by the name of aether, and the most turbid is mist and gloom; and there are other kinds which have no name, arising from the inequality of the triangles. Of water there are two primary divisions, the liquid and the fusible kind. The liquid sort owes its nature to possessing the smaller kinds of watery atoms, unequal in size; and so it can readily either move of itself or be moved by something else, owing to its lack of uniformity and the peculiar shape of its atoms. But that which consists of larger and uniform particles is more stable than the former and heavy, being stiffened by its uniformity: but when fire enters into it and breaks it up, it loses its uniformity and gains more power of motion: and as soon as it has become mobile, it is thrust by the surrounding air and spread out upon the earth: and it has received names descriptive of either process, melting of the dissolution of the mass, flowing of the extension on the ground. But when the fire goes forth from it again, seeing that it does not issue into empty space, the neighbouring air receives a thrust, and while the liquid mass is still mobile, it forces it to fill up the vacant places of the fire and unites it with itself. And being thus compressed and recovering its uniformity, seeing that fire the creator of inequality is quitting it, it settles into its normal state. And the departure of fire we call cooling, and the contraction that ensues on its withdrawal we class as solidification. Of all the substances which we have ranked as fusible kinds of water, that which is densest and formed of the finest and most uniform particles, a unique kind, combining brightness with a yellow hue, is gold, a most precious treasure, which has filtered through rocks and there congealed: and the ‘offspring of gold’, which is extremely hard owing to its density and has turned black, is called adamant. Another has particles resembling those of gold, but more than one kind; in density it even surpasses gold and has a small admixture of fine earth, so that it is harder, but lighter, because it has large interstices within; this formation is one of the shining and solid kinds of water and is called bronze. The earth which is mingled with it, when the two through age begin to separate again, becomes visible by itself and is named rust. And it were no intricate task to explain all the other substances of this kind, following the outline of our probable account. For if we pursue this as a recreation, and while laying down the principles of eternal being" find in plausible theories of becoming a pleasure that brings no remorse in its train, we may draw from it a sober and sensible amusement during our life. Now therefore setting out in this way let us go on to discuss the probabilities that lie next on the same subject.

Water mingled with, fire, such as is rare and liquid (owing to its mobility and its way of rolling along the ground, which gets it the name of liquid), and is also soft, because its bases give way, being less stable than those of earth,—when relinquished by fire and deserted of air, becomes more uniform and is compressed by the outgoing elements; thus it is congealed, and when above the earth this process takes place in an extreme degree, the result is hail; if upon the earth, it is ice: but when the process has not gone so far but leaves it half-congealed, above the earth it is snow, and when congealed from dew upon the earth, it is called hoarfrost. Most forms of water, which are intermingled with one another, filtered through the plants of the earth, are called by the class-name of saps; but owing to their intermixture they are all of diverse natures and the great multitude of them are accordingly unnamed: four kinds however which are of a fiery nature, being more conspicuous, have obtained names: one that heats the soul and body together, namely wine; next a kind which is smooth and divides the visual current and therefore appears bright and shining to view and glistening, I mean the class of oils, resin and castor oil and olive oil itself and all others that have the same properties; thirdly that which expands the contracted pores of the mouth to their natural condition, and by this property produces sweetness to the taste,—of this honey is the most general appellation; lastly that which corrodes the flesh by burning, a sort of frothy substance, distinct from all the other saps, which has been named verjuice.

Of the different kinds of earth, that which is strained through water becomes a stony mass in the following way.

When the commingled water is broken up in the mixing, it changes into the form of air; and having become air it darts up to its own region. Now there was no void surrounding it; accordingly it gives a thrust to the neighbouring air. And the air, being weighty, when it is thrust and poured around the mass of earth, presses it hard and squeezes it into the spaces which the new-made air quitted. Thus earth, when compressed by air into a mass that will not dissolve in water, forms stone; of which the transparent sort made of equal and uniform particles is fairer, while that of the opposite kind is less fair. But that which is suddenly deprived of all its moisture by the rapid action of fire and is become more brittle than the first forms the class to which we have given the name of earthenware. Again when some moisture is left behind, earth, after having been fused by fire and again cooled, becomes a certain stone of a black colour. There are also two sorts which in the same manner after the admixture are robbed of a great part of the water, being formed of the finer particles of earth with a saline taste, and becoming only half solid and soluble again by water; of these what purifies from oil and earth is alkali; while that which easily blends with all the combinations of tastes on the palate is, in the words of the ordinance, the god-beloved substance of salt. The bodies which are composed of earth and water combined cannot be dissolved by water, but by fire alone for the following reason. A mass of earth is resolved neither by fire nor by air, because their atoms are smaller than the interstices in its structure, so that they have abundant room to move in and do not force their way, wherefore instead of breaking it up they leave it undissolved: but whereas the parts of water are larger, they make their passage by force and dissolve the mass by breaking it up. Earth then, when it is not forcibly solidified, is thus dissolved by water only; but when it is solidified, only by fire, for no entrance is left except to fire. And of water the most forcible congelation is melted by fire alone, but the more feeble both fire and air break up; the latter by the interstices, the former by the triangles as well. Air, when forcibly condensed, can only be resolved into the elementary triangles, and when uncondensed fire alone dissolves it. In the case of a substance formed of water and earth combined, so long as water occupies the spaces in it that are forcibly compressed, the particles of water arriving from without find no entrance but simply flow round and leave the whole bulk undissolved; but those of fire enter into the interstices of the water, and acting upon it as water does upon earth, can alone cause the combined mass to melt and become liquid. In this class those which have less water than earth are all kinds of glass and all stones that are called fusible; and those which contain more water include all formations like wax and frankincense.

Now all the manifold forms that arise from diverse shapes and combinations and changes from one to another have been pretty fully set forth; next we must try to explain their affections and the causes that lead to them. First we must assign to all the substances we have described the property of causing sensation. But the origin of flesh and all that belongs to it and of the mortal part of soul we have not yet discussed.

Now this cannot be adequately dealt with apart from the affections of sense, nor yet can the latter without the former; yet to treat them both at once is hardly possible. We must assume one side then, and afterwards we will return to examine what we assumed. In order then that the properties of the several elements may be discussed in due order, let us first assume the nature of body and soul. First then let us see what we mean by calling fire hot; which we must consider in the following way, remembering the power of dividing and cutting which fire exercises upon our body. That the sensation is a sharp one we are all well enough aware: and the fineness of the. edges and sharpness of the angles, besides the smallness of its particles and the swiftness of its motion, all of which qualities combine to render it so vehement and piercing as keenly to cut whatever meets it—all this we must take into account, remembering the nature of its figure, that this more than any other kind penetrates our body and minutely divides it, whence the sensation that we now call heat justly derives its quality and its name. The opposite condition," though obvious enough, still must not lack an explanation. When the larger particles of moisture which surround the body enter into it, they displace the smaller, and because they are not able to pass into their places, they compress the moisture within us; and whereas it was irregular and mobile, they render it immovable owing to uniformity and contraction, and so it becomes rigid. And what is against nature contracted in obedience to nature struggles and thrusts itself apart; and to this struggling and quaking has been given the name of trembling and shivering: and both the effect and the cause of it are in all cases termed 'cold'.

'Hard' is the name given to all things to which our flesh yields; and 'soft' to those which yield to the flesh; and so also they are termed in their relation to each other. Those which yield are such as have a small base of support; and the figure with square surfaces, as it is most firmly based, is the most stubborn form; so too is whatever from the intensity of its compression offers the strongest resistance.

Of 'heavy' and ' light' we shall find the clearest explanation if we examine them together with the so-called 'below' and ' above'. That there are naturally two opposite regions, dividing the universe between them, one the lower, to which sink all things that have material bulk, the other upper, to which everything rises against its will, is altogether a false opinion. For since the form of the universe is spherical, all the extreme points, being equally distant from the centre, are by their very nature equally extreme; and the centre, being equally distant from all the extremes, ought to be regarded as opposite to all such points. This being the nature of the universe, how can one describe any of the said points as upper or lower, without justly being censured for using irrelevant terms? For the centre cannot properly be described as being above or below, but simply at the centre; while the circumference is neither itself central nor has any difference between the points on its surface, so that one has a different relation to the centre from an opposite point. Since then it is everywhere uniform, how and in what sense can we suppose we are speaking correctly if we use terms which imply opposition? For suppose in the midst of the universe there were a solid body in equilibrium, it would have no tendency towards any point in the circumference, owing to the absolute uniformity of the whole: indeed if we were to walk round the sphere, frequently, as we stood at the antipodes of our former position, we should call the same point on its surface successively 'above' and 'below'. For this universe being spherical, as we just now said, no rational man can speak of one region as upper, of another as lower: however whence these names were derived and under what conditions we use them to express this division of the entire universe, we may explain on the following hypothesis. In that region of the universe which is specially allotted to the element of fire, where indeed the greatest mass would be collected of that to which it is attracted, if one should attain to this place, and, acquiring the needful power, should separate portions of fire and weigh them in scales, when he raises the balance and forcibly drags the fire into the alien air, evidently he overpowers the smaller portion more easily than the larger: for when two masses are raised at once by the same force, necessarily the smaller yields more readily to the force, the larger, owing to its resistance, less readily: hence the larger mass is said to be heavy and to tend downwards, the smaller to be light and to tend upwards. This is exactly what we ought to detect ourselves doing in our own region. Moving as we do on the earth, we separate portions of earthy substances or sometimes earth itself, and drag them into the alien air with unnatural force, for each portion clings to its own kind. Now the smaller mass yields more readily to our force than the larger and follows quicker into the alien element; therefore we call it ‘ light’, and the place into which we force it ‘above’; while to the opposite conditions we apply the terms ‘heavy’ and ‘below’. Now that these mutual relations should vary is inevitable, because the bulk of the several elements occupy contrary positions in space. For as between a body that is light in one region and a body that is light in the opposite region, or as between two that are heavy, as well as upper and lower, all the lines of attraction will be found to become and remain relatively contrary and transverse and different in every possible way. But with all of them this one principle is to be borne in mind, that in every case it is the tendency towards the kindred element that makes us call the falling body heavy, and the place to which it falls, below; while to the reverse relations we apply the opposite names. So much then for the causes of these conditions. Of the qualities of smooth and rough any one could perceive the cause and explain it to another: the latter is produced by a combination of hardness and irregularity, the former by a combination of uniformity and density.

We have yet to consider the most important point relating to the affections which concern the whole body in common; that is, the cause of pleasure and pain accompanying the sensations we have discussed: and also the affections which produce sensation by means of the separate bodily organs and which involve attendant pains and pleasures. This then is how we must conceive the causes in the case of every affection, sensible or insensible, recollecting how we defined above the source of mobility and immobility: for this is the way we must seek the explanation we hope to find. When that which is naturally mobile is impressed by even a slight affection, it spreads abroad the motion, the particles one upon another producing the same effect, until coming to the sentient part it announces the property of the agent: but a substance that is immobile is too stable to spread the motion round about, and thus merely receives the affection but does not stir any neighbouring part; so that as the particles do not pass on one to another the original impulse which affected them, they keep it untransmitted to the entire creature and thus leave the recipient of the affection without sensation. This takes place with our bones and hair and all the parts we have which are formed mostly of earth: while the former conditions apply in the highest degree to sight and hearing, because they contain the greatest proportion of fire and air. The nature of pleasure and pain must be conceived thus: an affection contrary to nature, when it takes place forcibly and suddenly within us, is painful; a sudden return to the natural state is pleasant; a gentle and gradual process is imperceptible; and one of an opposite character is perceptible. Now a process which takes place with perfect facility is perceptible in a high degree, but is accompanied neither by pleasure nor by pain. An example will be found in the affections of the visual current, which we said above was in the daytime a material body cognate with ourselves. In this cutting and burning and any other affection cause no pain; nor does pleasure ensue when it returns to its normal state: but its perceptions are most vivid and accurate of whatsoever impresses it or whatsoever itself meets and touches. For its dilation and contraction are ‘ entirely free from violence. On the other hand bodies formed of larger particles, reluctantly yielding to the agent, and spreading the motions through the whole frame, cause pleasure and pain; when they are disturbed giving pain, and pleasure in being restored to their proper state. Those things which suffer a gradual withdrawing and emptying, but have their replenishment sudden and on a large scale, are insensible to the emptying but sensible of the replenishment; so that while they cause no pain to the mortal part of the soul, they produce very intense pleasure. This is to be observed in the case of sweet smells. But when the parts are disturbed suddenly, but gradually and laboriously restored to their former condition, they afford exactly the opposite result to the former: this may be seen in the case of burns and cuts on the body.

Now the affections common to the body as a whole and the names that have been given to the agents which produce them have been well-nigh expounded: next we must try to explain, if we can, what takes place in the separate parts of us, both as to the affections of them and the causes on the part of the agents. First then we must set forth to the best of our power all that we left unsaid concerning tastes, which are affections peculiar to the tongue. It appears that these, like most other things, are brought about by contraction and dilation, besides which they have more to do than other sensations with roughness and smoothness in the agents. For whenever earthy particles enter in by the little veins which are a kind of testing instruments of the tongue, stretched to the heart, and strike upon the moist and soft parts of the flesh, these particles as they are being dissolved contract and dry the small veins; and if they are very rough, they are termed ‘astringent’; if less so ‘harsh’. Such substances again as are detergent and rinse the whole surface of the tongue, if they do this to an excessive degree and encroach so as to dissolve part of the structure of the flesh, as is the property of alkalies—all such are termed ‘bitter’: but those which fall short of the alkaline quality and rinse the tongue only to a moderate extent are saline without bitterness and seem to us agreeable rather than the reverse. Those which share the warmth of the mouth and are softened by it, being simultaneously inflamed and themselves in turn scorching that which heated them, and which owing to their lightness fly upward to the senses of the head, penetrating all that is in their path—owing to these properties all such substances are called ‘pungent’. But sometimes these same substances, having been already refined by decomposition, enter into the narrow veins, being duly proportioned to the earthy particles and the particles of air which are there, so that they set them in motion and mingle them together, and thereby cause them to jostle against one another and taking up other positions to form new hollows extended round the entering particles—which hollows consist of a film of moisture, sometimes earthy, sometimes pure, embracing a volume of air; and thus they form moist capsules containing air:—in some cases the films are of pure moisture and transparent and are called bubbles; in others they are of earthy liquid which effervesces and rises all together, when the name of seething and fermentation is given to it: and the cause of all these conditions is termed ‘acid’. The opposite affection to all those which have been described is produced by an opposite cause: when the structure of the entering particles amid the moisture, having a natural affinity to the tongue’s normal condition, smooths it by mollifying the roughened parts, and relaxes or contracts what is unnaturally contracted or expanded, and settles everything as much as possible in its natural state. Every such remedy of violent affections is to all of us pleasant and agreeable, and has received the name of ‘sweet’.

Enough of this subject. As regards the faculty of the nostrils no classification can be made. For smells are of a half-formed nature: and no class of figure has the adaptation requisite for producing any smell, but our veins in this part are formed too narrow for earth and water, and too wide for fire and air: for which cause no one ever perceived any smell of these bodies; but smells arise from substances which are being either liquefied or decomposed or dissolved or evaporated: for when water is changing into air and air into water, odors arise in the intermediate condition; and all odors are vapor or mist, mist being the conversion of air into water, and vapor the conversion of water into air; whence all smells are subtler than water and coarser than air. This is proved when any obstacle is placed before the passages of respiration, and then one forcibly inhales the air: for then no smell filters through with it, but the air bereft of all scent alone follows the inhalation. For this reason the complex varieties of odor are unnamed, and are ranked in classes neither numerous nor simple: only two conspicuous kinds are in fact here distinguished, pleasant and unpleasant. The latter roughens and irritates all the cavity of the body that is between the head and the navel; the former soothes this same region and restores it with contentment to its own natural condition.

A third organ of sensation in us which we have to examine is that of hearing, and we must state the causes whence arise the affections connected with it. Let us in general terms define sound as a stroke transmitted through the ears by the air and passed through the brain and the blood to the soul; while the motion produced by it, beginning in the head and ending in the region of the liver, is hearing. A rapid motion produces a shrill sound, a slower one a deeper sound; regular vibration gives an even and smooth sound, and the opposite a harsh one; if the movement is large, the sound is loud; if otherwise, it is slight. Concerning accords of sound we must speak later on in our discourse.

A fourth faculty of sense yet remains, the intricate varieties of which it is our part to classify. To these we have given the name of colours, which consist of a flame streaming off from every object, having its particles so adjusted to those of the visual current as to excite sensation. We have already set forth the causes which gave origin to vision: thus therefore it will be most natural and fitting for a rational theory to treat of the question of colours. The particles which issue from outward objects and meet the visual stream are some of them smaller, some larger, and some equal in size to the particles of that stream. Those of equal size cause no sensation, and these we call transparent; but the larger and smaller, in the one case by contracting, in the other by dilating it, produce effects akin to the action of heat and cold on the flesh, and to the action on the tongue of astringent tastes and the heating sensations which we termed pungent. These are white and black, affections identical with those just mentioned, but occurring in a different class and seeming to be different for the causes aforesaid. We must then classify them as follows. What dilates the visual stream is white, and the opposite thereof is black. A swifter motion belonging to a different kind of fire, which meets and penetrates the visual stream quite up to the eyes, and forcibly displaces and decomposes the pores of the eyes themselves, draws from thence a combined body of fire and water, which we call a tear: and whereas this agent is itself fire, meeting the other from the opposite direction, and one fire leaps forth as lightning from the eyes, while the other enters in and is quenched in the moisture, all manner of colours arise in this commixture; and to the sensation we give the name of dazzling, and the agent which produces it we call bright and shining. A kind of fire which is intermediate between the two former, when it reaches the moisture of the eye and is mingled with it, but does not flash, produces a blood-like colour by the mixture of fire with the gleam of the moisture, and the name we give it is red. Bright combined with red and white makes yellow. In what proportion they are mingled, it were not reasonable to say, even if we knew; for there is neither any inevitable law nor any probable account thereof which we might properly declare. Red mingled with black and white becomes purple, which turns to dark violet when these ingredients are more burnt and a greater quantity of black is added. Chestnut arises from the mixture of yellow and grey, and grey from white and black: pale buff is from white mixed with yellow. When bright meets white and is steeped in intense black, a deep blue colour is the result; and deep blue mingled with white produces pale blue; and chestnut with black makes green. And for the remaining colours, it is pretty clear from the foregoing to what combinations we ought to assign them so as to preserve the probability of our account: but if a man endeavor to make practical trial of these theories he will prove himself ignorant of the difference between divine and human intelligence: that God has sufficient understanding and power to blend the many into one and again to resolve the one into many; but no man is able to do either of these, now or henceforth for ever.

All these things being thus constituted by necessity, the creator of the most fair and perfect in the realm of becoming took them over, when he was generating the self-sufficing and most perfect god, using the forces in them as subservient causes, but himself working out the good in all things that come into being. Wherefore we must distinguish two kinds of causes, one of necessity and one of God: and the divine we must seek in all things for the sake of winning a happy life, so far as our nature admits of it; and the necessary for the sake of the divine, reflecting that without these we cannot apprehend by themselves the other truths, which are the object of our serious study, nor grasp them nor in any other way attain to them.

Now therefore that the different kinds of causes lie ready sorted to our hand, like wood prepared for a carpenter, of which we must weave the web of our ensuing discourse, let us in brief speech return to the beginning and proceed once more to the spot whence we arrived at our present point; and so let us endeavor to add an end and a climax to our story conformable with what has gone before.

As was said then at the beginning, when God found these things without order either in the relation of each thing to itself or of one to another, he introduced proportion among them, in as many kinds and ways as it was possible for them to be proportionate and harmonious. For at that time neither had they any proportion, except by mere chance, nor did any of the bodies that now are named by us deserve the name, such as fire and water and the other elements: but first he ordered all these, and then out of them wrought this universe, a single living creature containing within itself all living creatures, mortal and immortal, that exist. And of the divine he himself was the creator; but the creation of mortals he delivered over to his own children to work out. And they, in imitation of him, having received from him the immortal principle of soul, fashioned round about her a mortal body and gave her all the body to ride in; and beside her they built in another kind of soul, even that which is mortal, having within itself dread and inevitable passions—first pleasure, the strongest allurement of evil, next pains, that scare good things away; confidence moreover and fear, a yoke of thoughtless counselors; wrath hard to assuage and hope that lightly leads astray; and having mingled all these perforce with reasonless sensation and love that ventures all things, so they fashioned the mortal soul. And for this cause, in awe of defiling the divine, so far as was not altogether necessary, they set the mortal kind to dwell apart from the other in another chamber of the body, having built an isthmus and boundary between the head and the breast, setting the neck between them to keep them apart. So in the breast, or the thorax as it is called, they confined the mortal kind of soul. And whereas one part of-it was nobler, the other baser, they built a party-wall across the hollow of the chest, as if they were marking off an apartment for women and another for men, and they put the midriff as a fence between them. That part of the soul which shares courage and anger, seeing that it is warlike, they planted nearer the head, between the midriff and the neck, that it might be within hearing of the reason and might join it in forcibly keeping down the tribe of lusts, when they would in no wise consent to obey the order and word of command from the citadel. And the heart, which is the knot of the veins and the fount of the blood which rushes vehemently through all the limbs, they made into the guardhouse, that whensoever the fury of anger boiled up at the message from the reason, that some unrighteous dealing is being wrought around them, either without, or, it may be, by the lusts within, swiftly through all the narrow channels all the sensitive power in the body might be aware of the admonitions and threats and be obedient to them and follow them altogether, and so permit the noblest part to be leader among them all.

For the throbbing of the heart in the anticipation of danger or the excitement of wrath, since they foreknew that all such swelling of passion should come to pass by means of fire, they devised a plan of relief, and framed within us the structure of the lungs, which in the first place is soft and void of blood, and next is perforated within with cavities like those of a sponge, in order that receiving the breath and the drink it might cause coolness and give rest and relief in the burning. Wherefore they made the windpipe for a channel to the lungs, which they set around the heart, as it were a soft cushion to spring upon; so that when wrath was at its height therein, the heart might leap upon a yielding substance and become cooled, and thus being less distressed it might together with the emotions be better enabled to obey the reason.

But that part of the soul which lusts after meat and drink and all things whereof it has need owing to the body’s nature, this they set between the midriff and the navel as its boundary, constructing in all this region as it were a manger for the sustenance of the body: and here they chained it like a wild beast, which must yet be reared in conjunction with the rest, if a mortal race were to be at all. To the end then that always feeding at its stall and dwelling as far as possible from the seat of counsel, it might produce the least possible tumult and uproar and allow the noblest part to consult in peace for the common weal, here they assigned it its place. And knowing that it would have no comprehension of reason, and that even if it did in some way gain any perception of rational thoughts, it was not in its nature to take heed to any such things, but that it would be entirely led away by images and shadows both by night and by day, God devised as a remedy for this the nature of the liver, which he constructed and set in its dwelling place: and he made it a body dense and smooth and bright and sweet with a share of bitterness. This he did to the end that the influence of thoughts proceeding from the brain, when the liver received outlines of them, as if in a mirror, and exhibited reflections to view, might strike terror into the appetitive part, whenever making use of the bitter element akin to its own dark nature and threatening with stern approach, diffusing the bitterness swiftly throughout the whole liver it displayed a bilious colour, and contracting it made it all rough and wrinkled, and reaching the lobe and the vessels and the inlet, twisted the first from its right position and contorted it, while at the same time it obstructed and closed up the two latter, thereby producing pain and nausea: and on the other hand in order that, whenever a breath of mildness from the reason copied off on the liver visions of an opposite kind, giving relief from the bitterness, because it will not excite a nature opposite to its own nor have dealing with it, but using upon the liver the sweetness that exists therein and soothing everything till all is straight and smooth and free, it might render gentle and calm that part of the soul which is settled about the liver, and might enable it to secure a sober amusement at night, enjoying divination during sleep, in recompense for its deprivation of intelligence and wisdom. For our creators, because they remembered the behest of their father, when he commanded them to make the mortal race as perfect as they were able, in this wise redeeming even the baser part of us, that it might have in some way a hold on the truth, placed in this region the seat of divination.

Now that divination is the gift of God to human folly, this is a sufficient proof. No man in his sound senses deals in true and inspired divination, but when the power of his understanding is fettered in sleep or by sickness, or if he has become distraught by some divine possession. The part of the sane man is to remember and interpret all things that are declared, dreaming or waking, by the prophetic and inspired nature; and whatsoever visions are beheld by the seer, to determine by reason in what way and to whom they betoken good or ill in the future or the present or the past: but it is not for him who has become mad and still is in that state to judge his own visions and utterances; the old saying remains true, that only for the sane man is it meet to act and to be the judge of his own actions and of himself. Whence has arisen the custom of setting up interpreters as judges of inspired prophecy: these are themselves called prophets by some who are altogether unaware that they are but the expounders of mystic speech and visions, and ought not in strict accuracy to be called prophets, but interpreters of the prophecies.

Such is the nature of the liver and its situation that we have described, for the purpose of prophecy as aforesaid. And while each body has life, this organ displays the signs clearly enough; but when deprived of life, it is become blind and gives the token too dimly to afford any plain meaning. And the structure of the neighbouring organ and its position on the left has been planned for the sake of the liver, in order to keep it always bright and clean, as a napkin is prepared and laid ready for the cleansing of a mirror. Wherefore whenever any impurities arise in the region of the liver owing to sickness of the body, all is received and purified by the fine substance of the spleen, which is woven hollow and void of blood. This, when it is filled with the impurities from the liver, waxes swollen and festered; and again, when the body is purged, it is reduced and sinks again to its natural state.

Now as concerning soul, how far she has a mortal, how far a divine nature, and in what wise and with what conjunctions and for what causes she has her separate habitations, only when God has confirmed our statement can we confidently aver that it is true: nevertheless that we have given the probable account we may venture to say even now and still more on further meditation, and so let it be said. But what follows upon the foregoing is the next object of our research: this was the manner wherein the rest of the body has come into being.

The following is the design on which it were most fitting to conceive that it is constructed. They who framed our race knew the intemperance in meat and drink that would prevail in us, and that for greed we should use far more than was moderate or necessary. In order then that swift destruction through sickness might not fall upon us, and that the mortal race might not perish out of hand before coming to completion, foreseeing the danger they made the abdomen, as it is called, a receptacle to contain the superfluity of food and drink, and coiled the bowels round about therein, lest the food passing speedily through should compel the body quickly to stand in need of a fresh supply, and thus producing an insatiable craving should render the whole race through gluttony devoid of philosophy and letters and disobedient to the highest part of our nature.

Concerning the bones and flesh and all such substances the case stands thus. The foundation of all these is the marrow: for the bonds of life whereby the soul is bound to the body were fastened in it throughout and planted therein the roots of human nature. But the marrow itself comes from other sources. Such of the primal triangles as were unwarped and smooth and thus able to produce fire and water and air and earth of the purest quality, these God selected and set apart, each from its own class, and mingling them in proportion one with another, to make a common seed for all the race of mortals, he formed of them the marrow; and thereafter he implanted and fastened in it the several kinds of soul; and according to the number and fashion of the shapes that the soul should have corresponding to her kinds, into so many similar forms did he divide the marrow at the very outset of his distribution. And that which should be as it were a field to contain in it the divine seed he molded in a spherical form all round; and this part of the marrow he called the brain, with the view that, when each animal was completed, the vessel containing it should be the head. But that which was to have the mortal part of soul which remained he distributed into moulds that were at once round and elongated: but he called all these forms marrow; and from these, as though from anchors, he put forth bonds to fasten all the soul, and then he wrought the entire body round about it, first building to fence it a covering of bone. And bone he formed in this way: having sifted out earth that was pure and smooth he kneaded and soaked it with marrow, and after that he placed it in fire; and next he set it in water, and again in fire, and once more in water: and thus having shifted it many times from one to another he made it indissoluble by either. Making use of this, he carved a bony sphere thereof to surround the brain, but on one side he left a narrow outlet; and around the marrow of the neck and back he made vertebrae of bone and set them to serve as pivots, beginning at the head and carrying them through the whole length of the body. Thus to preserve all the seed he enclosed it in a strong envelope, and he made joints in it, using the power of the Other as an intermediary between the parts, for the sake of moving and bending them. But deeming that the structure of bone was too rigid and inflexible, and that should it be inflamed and cooled again, it would rot away and quickly destroy the seed within it, for this cause God devised the sinews and the flesh, that binding all the limbs together with the former he might by their tension and relaxation round their pivots enable the body to bend and extend itself; while the flesh he designed as a defence against heat and a shelter from cold; and moreover that it might be, like coverings of felt, a protection against falls, gently and easily yielding to external bodies; and containing a warm moisture within itself, in summer it might exude this, and spreading dampness on the surface might diffuse a natural coolness over all the body; but in winter on the other hand it might by its own fire afford a fair protection against the frost that assailed and surrounded it from without. Considering this, he that molded us like wax made a mixture and blending of water and fire and earth; and compounding a ferment of acid and salt he mingled it with them and produced soft flesh full of sap: the sinews he composed of bone and unfermented flesh, a separate substance having an intermediate function; and to this he added a yellow colour. Accordingly the sinews received a power more firm and tenacious than the flesh, but more soft and flexible than the bones.

With these God covered the bones and marrow; and after he had bound one part to another with sinews, he enveloped them over all with flesh. Those bones which were chiefly inhabited by soul, he enclosed with the smallest amount of flesh; but those wherein was least soul he covered most abundantly and densely with it: moreover at the joints of the bones, save where reason showed that it ought to be there, he put but little flesh, that neither it might render the body unwieldy by hindering its flexions and impeding its motions, nor again that a dense mass of flesh piled together, producing by its hardness a dullness of sensation, might render the faculties of the mind too slow of memory and hard of apprehension. Wherefore the thighs and the shins and the parts about the hips and the bones in the upper arms and the fore-arms and all parts of our limbs which are without joints, and all bones which are devoid of intelligence owing to the small amount of soul inhering in marrow within them, all these are abundantly furnished with flesh; but those which are the seat of intelligence have less: except in cases where God has formed the flesh to be in itself an organ of sensation, as for instance the tongue: in most however it is as aforesaid; for this material nature which comes into being by the law of necessity and is reared with us does not allow dense bone and much flesh to be accompanied by ready and keen perception. For had these two conditions consented to combine, the structure of the head would have displayed them in the highest degree; and the human being, bearing upon it a fleshy head, sinewy and strong, would have enjoyed a life twice, nay many times as long as now, besides being much more healthy and free from pain. But as it is, the creators who brought us to being considered whether they should make a long-lived race that was inferior, or one more short-lived which was nobler, and they agreed that every one must by all means choose a shorter and nobler life in preference to a longer but baser. Therefore they covered the head with thin bone, but not with flesh nor sinews, since it has no flexions. On all these grounds the head that is set upon the body of every man is much quicker of apprehension and understanding, but much weaker. For these reasons and in this manner God placed the sinews all round the base of the head about the neck and cemented them with uniformity; and he fastened the extremities of the jaw-bones to them just under the face; and the rest he distributed over all the limbs, uniting joint to joint. And our framers ordained the functions of the mouth, furnishing it with teeth and tongue and lips, in the way it is now arranged, combining in their purpose the necessary and the best; for they devised the incoming with the necessary in view, but the outgoing with the most excellent. For all that enters in to give sustenance to the body is of necessity; but the stream of speech which flows out and ministers to understanding is of all streams the most noble and excellent. But as to the head, it was neither possible to leave it of bare bone, owing to the extremes of heat and cold in the seasons; nor yet by covering it over to allow it to become dull and senseless through the burden of flesh. Of the fleshy material as it was drying a larger film formed on the surface and separated itself; this is what is now called skin. This by the influence of the moisture of the brain combined and grew up and clothed the head all round: and the moisture rising up under the sutures saturated and closed it in on the crown, fastening it together like a knot. Now the form of the sutures is manifold, owing to the power of the soul's revolutions and of the aliment; if these contend more vehemently one with another, the sutures are more in number; but if less so, they are fewer. Now the whole of this skin was pricked all about with fire by the divine part: and. when it was pierced and the moisture issued forth through it, all the moisture and heat which was pure vanished away; but that which was mingled with the substances whereof the skin was formed, being lifted up by the impulse, stretched far outwards, in fineness equaling the size of the puncture; but owing to the slowness of its motion it was thrust back by the surrounding air, and being forced in and rolled up under the skin it took root there. Under these conditions hair grows up in the skin, being of similar nature but of threadlike appearance, and made harder and denser by the contraction of cooling: for every hair in being separated from the skin was cooled and contracted. Hereby has our creator made our head hairy, using the means aforesaid, and conceiving that this instead of flesh should be a covering for the protection of the brain, being light and capable of affording shade from heat and shelter from cold, while it would be no hindrance in the way of ready apprehension. The threefold combination of sinew skin and bone in the fabric of the fingers, when dried, forms out of all a single hard skin, for the construction of which these substances served as means, but the true cause and purpose of its formation was the welfare of races not yet existing. For our creators were aware that men should pass into women, and afterwards into beasts; and they knew that many creatures would need the aid of nails for many purposes: wherefore at the very birth of the human race they fashioned the rudiments of nails. On such reasoning and with such purposes did they form skin and hair, and on the extremities of the limbs nails.

Now when all the parts and members of the mortal being were created in union, and since his life was made perforce dependent upon fire and air, and therefore his body suffered waste through being dissolved and left void by these, the gods devised succor for him. They engendered another nature akin to the nature of man, blending it with other forms and sensations, so as to be another kind of animal. These are the cultivated trees and plants and seeds, which are now trained by culture and domesticated with us; but formerly there existed only the wild kinds, which are older than the cultivated. For indeed everything which partakes of life may with perfect justice and fitness be termed an animal; but the kind of which we are now speaking shares only the third form of soul, which our theory says is seated between the midriff and the navel, and which has nothing to do with opinion and reasoning and thought, but only with sensation, pleasant or painful, with appetites accompanying. For it ever continues passively receptive of all sensations, and having its circulation in itself about its own centre, it rejects all motion from without and uses only its own; but its nature has not bestowed upon it any power of observing its own being and reflecting thereon. Wherefore it is indeed alive and in no wise differs from an animal, but it is stationary and rooted fast, because it has been denied the power of self-motion.

Thus did the higher powers create all these kinds as sustenance for us who were feebler; and next they made canals in the substance of our body, as though they were cutting runnels in a garden, that it might be irrigated as by an inflowing stream. And first they carried like hidden rills, under the place where the skin and the flesh are joined, two veins down the back, following the twofold division of the body into right and left. These they brought down on either side of the spine and the seminal marrow, first in order that this might be most vigorous, next that the current might have an easy flow downwards and render the irrigation regular. After that, they cleft the veins around the head, and interweaving them crossed them in opposite directions, carrying these from the right side of the body to the left and those from the left to the right. This they did, partly in order that together with the skin they might form a bond to fasten the head to the body, seeing that it was not set round with sinews on the crown; and also that this might be a means of distributing from each side throughout the whole body the sensation due to the perceptions. And next to this they designed the irrigation on a kind of plan which we shall better discern by assuming the following premises. All bodies which are composed of smaller particles exclude the larger, but the larger cannot exclude the smaller. Fire is composed of finer particles than any other element, whence it penetrates through water and earth and air and whatever is composed of them, and nothing can keep it out. This rule must also be applied to the human belly; when food and drink enter into it, it keeps them in; but air and fire, being finer than its own structure, it cannot keep in. Accordingly „ God used these two elements for the conveyance of liquid from the belly to the veins, weaving of air and fire a network like a fish-trap or weel, having two lesser weels within with a double inlet; one of which inlets he again wove with two passages; and from the lesser weels he stretched as it were cords on all sides to the extremities of the network. All the inner part of the net he constructed of fire, but the lesser weels and the envelope he made of airy substance; and he took the net and wrapped it in manner following about the animal he had molded. The structure of the lesser weels he carried into the mouth: and, these being twofold, he let down one of them by the windpipe into the lungs, the other past the windpipe into the belly. The one weel he split in two, and let both inlets meet by the passages of the nostrils, so that when the first inlet was not in action by way of the mouth, all its currents also might be replenished from the second. But with the general surface, of the network he enveloped all the hollow part of our body; and all this, seeing it was air, he now caused to flow gently into the lesser weels, now made them flow back upon it; and since the body is of porous texture, the network passes through it inward and again outward, and the beams of fire which are confined within follow the air as it moves in either direction: and this never ceases to go on so long as the mortal creature holds together. To this process he who appointed names gave, we say, the titles of inspiration and expiration: and from this condition, both active and passive, it has come about that our body, deriving moisture and coolness, has its sustenance and life. For when, as the respiration passes in and out, the interwoven fire within follows it and entering the belly swings up and down and meets the food and drink, it dissolves them, and reducing them to small particles, drives them along the channels through which it flows, pumping them into the veins like spring-water into conduits, and so it makes the current of the veins flow through the body as through an aqueduct.

Let us once more examine the process of respiration and the causes which have led to its present conditions. These are as follows. Since there is no void into which any-moving body could enter, and since the breath issues forth from us, the consequence is clear to every one: instead of entering into a void space it thrusts the neighbouring matter out of its place. And this, yielding to the thrust, drives before it that which is immediately nearest; and all being driven round by this compulsion enters into the place whence the breath came forth, and replenishing the same follows after the breath; and this whole process goes on like the rotation of a wheel, because there is no void. Therefore when the cavity of the chest and the lungs send forth the breath, they are again replenished by the air surrounding the body, which penetrates inwards through the flesh, seeing it is porous, and is forced round in a circuit. And again when the air returns and passes forth through the body, it thrusts the breath back again inwards through the passages of the mouth and nostrils. The cause which sets this principle in action we may describe thus. In every animal the inner parts about the blood and veins are the hottest, as if there were a fount of fire contained in it. This is what we compare to the network of the weel, supposing that all the part extending from the middle to the sides is woven of fire, but the outer part of air. Now we must, admit that the heat naturally tends outwards to its own region and its own kin. And whereas there are two means of egress, one out through the body, the other by way of the mouth and nostrils, when it makes for one exit, it impels the air round towards the other. And the air so impelled falling into the fire is heated, but that which passes out is cooled. So the heat changes its position and the parts about the other outlet become warmer; therefore the heat now has a stronger tendency in the new direction, seeking its own affinity, and impels the air by the other passage: and this, undergoing the same change and reproducing the same process, is thus by these two impulses converted into a wheel swaying backwards and forwards, and so it gives rise to respiration.

In the same direction are we to look for the explanation of the phenomena of medical cupping-glasses and of swallowing and of projected bodies, whether cast through the air or moving along the ground; and of sounds too, which from their swiftness and slowness seem to us shrill or deep, sometimes having no harmony in their movements owing to the irregularity of the vibrations they produce in us, sometimes being harmonious through regularity. For the slower sounds overtake the motions of the first and swifter sounds, when these are already beginning to die away and have become assimilated to the motions which the slower on their arrival impart to them: and on overtaking them they do not produce discord by the intrusion of an alien movement, but adding the commencement of a slower motion, which corresponds to that of the swifter now that the latter is beginning to cease, they form one harmonious sensation by the blending of shrill and deep. Thereby they afford pleasure to the foolish, but to the wise joy, through the imitation of the divine harmony which is given by mortal motions. And the flowing of all waters, the fall of thunderbolts, and-the wonderful attracting power of amber and of the loadstone—all these are due to no drawing power, but to two causes: first there is no void, and the atoms jostle one upon another; secondly when they are divided or contracted they change places and move severally towards their own region; and by the complication of such conditions all these wonders arise, as will be plain to him who examines them by the proper method.

The process of respiration then, whence this discussion arose, rests on the principles and causes which have been set forth: fire divides the food, following the air as it sways up and down within; and through this oscillation it replenishes the veins from the belly by pumping into them from thence the comminuted food. In this way throughout the whole body of all animals the streams of nourishment are kept constantly supplied. And the particles of food, being freshly severed and from kindred substances—some from fruits and some from herbs, which God planted just to be our sustenance,—have all manner of colours owing to their intermixture; but a red hue pervades them most of all, through the natural contrivance whereby the fire divides the food and imprints its own hue upon it: whence the colour of the fluid that circulates through the body has the appearance we have described. This we call blood, which is the sustenance of the flesh and of all the body, and from which all parts draw moisture to fill up the places that are left void. And the mode of replenishment and evacuation is like the motion of all things in the universe, whereby all kindred substances seek each other. The elements that surround us without are constantly dissolving our substance and distributing it to its several kinds, returning each to its own kindred: and again the particles of blood, being minutely- divided within us and enveloped in every creature by the body, as though by a heaven surrounding them, are forced to copy the universal motion. Therefore each of the divided particles within us is carried to its own kind and thus replenishes again what was left void. Now when the loss is greater than the replenishment, everything diminishes, but when less, it increases. The young frame then of the entire creature, having the triangles of its elements still as if fresh from the workshop, has them firmly linked one to another; but the whole mass is soft in substance, seeing that it has been newly formed out of marrow and nurtured upon milk. Now forasmuch as the triangles of the substances composing the food and drink, which enter from without and are received within the young creature, are older and feebler than those of the latter, it divides and subdues them with its new triangles, and by the assimilation of a large number nourishes and increases the animal: but when the exact outline of the triangles is blunted, because they have been for a long time struggling with many others, they are not able as of old to comminute and assimilate the entering aliment, but are themselves easily divided by the incoming particles. At such a time every living thing is enfeebled and wastes away; and this condition is termed old age. Finally when the bonds of the triangles belonging to the marrow no longer hold to their fastenings but snap asunder with the stress, they loose in their turn the bonds of the soul; and she, being in the course of nature released, flies away with gladness. For all that is contrary to nature is painful; but whatsoever takes place in the natural way is pleasant. On the same principle death which ensues upon sickness or wounds is painful and violent; but that which draws to the natural end in the course of old age is of all deaths the least distressing and is accompanied rather by pleasure than by pain.

Now the cause whence sicknesses arise is doubtless evident to all. For seeing there are four elements of which the body is composed, earth fire water and air, any unnatural excess or defect of these or change of position from their own to an alien region, and also—since there are more than one kind of fire and the other elements—the reception by each of an unfitting kind, and other such causes, all combine to produce discord and disease. For when any of them changes its nature and position, the parts that formerly were cool are heated, and those that were dry become afterwards moist, and the light become heavy, and all undergo every kind of change. The only way we allow in which one and the same substance can remain whole and unchanged and sound is that the same element should be added to it or taken away from it on the "same principle and in the same manner and proportion; and whatsoever errs in any of these points in its outgoings or incomings causes a vast diversity of vicissitudes and diseases and destructions. Next in the secondary structures which are in a natural state of union a second class of diseases may be discerned by one who would scrutinize them. For whereas marrow and bone and flesh and sinew are composed of the four elements, and blood is formed of the same though in a different way, most of the diseases arise in the manner before explained, but the gravest afflict them with especial severity in the following way: that is to say, when the order of their generation is reversed, these structures are then destroyed. For in the course of nature flesh and sinews arise from blood, the sinews from the fibrine, owing to their affinity; the flesh from the clots which are formed when the fibrine is separated. From the sinews and flesh again proceeds a glutinous and oily fluid, which not only cements the flesh to the structure of the bones and itself gives nourishment and growth to the bone which encloses the marrow, but also so much of it as filters through the dense substance of the bones, being formed of the purest and smoothest and most slippery kind of the triangles, as it distils and oozes from the bones, irrigates the marrow. When these structures are produced in this order, health is the result as a rule; but when this is reversed, sickness ensues. For when the flesh decomposes and returns the deliquescent matter to the veins, then is mingled with air in the veins much blood of manifold kinds, with diverse hues and bitter qualities, as well as acid and saline properties; and this contains all kinds of bile and serum and phlegm. For as all these are going the wrong way and have become corrupt, first they ruin the blood itself, and furnishing no nutriment to the body rush in all directions through the veins, paying no heed to the periods appointed by nature, but at war one with another, because they have no good of each other; at war also with all that is established and fixed in the body, which they corrupt and dissolve. Now when the oldest part of the flesh is decomposed, being hard to soften, it turns black through long-continued burning, and through being everywhere corroded it is bitter and dangerous to whatever part of the body it attacks which is not yet corrupted. Sometimes this black sort is acid instead of bitter, when the bitterness is more refined away; and again the bitter sort being steeped in blood gains a redder hue; and when black is mingled with this, it is greenish: sometimes too a yellow colour is added to the bitterness, when new flesh is decomposed by the fire of the inflammation. To all these symptoms the general name of bile has been given, either by physicians, or by some one who in looking at many dissimilar appearances was able to see one universal quality pervading them all which deserved a name. All other kinds of bile which are reckoned have their several descriptions according to their colour. Of lymph, one kind is the mild serum of blood,—the other is an acrid secretion of black and acid bile, when that is blended through inflammation with a saline property: this kind is called acid phlegm. But that which is formed in conjunction with air by the liquefaction of new and tender flesh,—when it is inflated with air enveloped by moisture, and through this condition bubbles are formed, invisible separately because of their smallness, but all together becoming visible in the mass and presenting a white colour to view by the formation of froth—this liquefaction of tender flesh in combination with air we term white phlegm. And the serum of freshly formed phlegm is sweat and tears, and whatever other secretions purify the body from day to day. All these become a means of disease, when the blood is not replenished from the food and drink in the natural way, but receives its volume in the contrary manner in despite of nature's laws. Now when the flesh is anywhere pierced by disease, but the foundations of it remain intact, the malady has only half its power; for there is still the prospect of ready recovery. But when that which unites' the flesh to the bones is diseased, and in turn no longer by distilling both from the fibers and sinews nourishes the bones and cements the flesh to them, but instead of being oily and smooth and glutinous becomes harsh and saline and shriveled through an unhealthy habit of life, under these conditions all that substance crumbles away under the flesh and the sinews and separates from the bones; while the flesh, falling away from its foundations, leaves the sinews bare and full of brine, and itself falling back into the current of the blood aggravates the diseases that have been described. But distressing as are these symptoms which affect the body, yet more serious are those which are prior in order; when the bones, owing to denseness of the flesh, cannot get sufficient air and becoming moldy and heated decay away, and while they will not receive their nourishment, crumble down and return by a reversed process into their nourishing fluid, and that in its turn passing into flesh, and the flesh into blood, they render all the diseases more virulent than those already mentioned. The most desperate case of all is when the substance of the marrow becomes diseased by any defect or excess: this produces the most serious and fatal disorders, seeing that the whole nature of the body is forced to proceed in a backward course.

A third class of diseases we must conceive as occurring in three ways: one by the agency of air, the second of phlegm, the third of bile. For when the lungs, which are the dispensers of air to the body, do not keep their passages clear, because they are impeded by catarrhs, the air, failing to pass through some, and in others entering with a volume unduly great, causes the decomposition of the parts which lack their supply of air, and forces its way through the channels of the veins and dislocates them, and dissolving the body it is confined amid its substance, occupying the midriff; and so countless painful diseases are produced from these causes, accompanied by excessive sweat. Often too when the flesh is broken up, air is formed in the body, and being unable to find an exit it produces the same torments as are caused by the air which enters in; the most severe of all, when gathering and swelling up around the sinews and the blood-vessels in these parts it strains the tendons of the shoulders and the muscles attached to them in a backward direction: and owing to the intense strain produced in this condition these affections are called tetanus and opisthotonus. For these the remedy is severe: for in fact fevers supervening chiefly give relief in such cases. The white phlegm when intercepted is dangerous owing to the air in the bubbles: but when it finds an escape to the surface of the body it is more mild; yet it disfigures the person by engendering scabs and leprosies and kindred maladies. Sometimes it is mingled with black bile and is shed upon the revolutions in the head, which are the most divine, and confounds them; and if this occurs during sleep, the effects are milder, but if in the waking hours, it is harder to relieve. This, as affecting the sacred part, is justly called the sacred disease. Acid and saline phlegm is the source of all diseases that take the form of catarrh: and these have received manifold names according to the diverse places in which the discharge takes place. Inflammations in various parts of the body, so called from the heat and burning that occurs, are all due to bile. When they have egress, they seethe up and send forth all kinds of pustules; but if they are suppressed within, they cause many inflammatory diseases; of which the worst is when the inflammation entering into pure blood carries away from its proper place the fibrine which was distributed through the blood in order that it might preserve a due measure of thinness and thickness and neither be so much liquefied by heat as to flow out through the porous texture of the body, nor become sluggish from excessive density and circulate with difficulty in the veins. Now the fibrine by the nature of its composition preserves the due mean in these respects. For if from blood that is dead and beginning to cool the fibrine be gathered apart, the rest of the blood is dissipated; but if the fibrine be allowed to remain, by the help of the cold air surrounding, it quickly congeals it. The fibrine then in the blood having this property, bile which is naturally formed of old blood and is dissolved again into blood out of the flesh, enters warm and liquid into the blood, at first gradually, and is condensed by the power of the fibrine; and as it is condensed and forced to cool, it produces internal chill and shivering. But when a greater quantity flows in, it subdues the fibrine with its heat, and boiling up scatters it abroad; and if it is able to obtain the mastery to the end, it penetrates to the substance of the marrow, and consuming it looses from thence the bonds of the soul, as it were the moorings of a ship, and sets her free. But when the bile is too feeble for this, and the body holds out against the dissolution, itself is vanquished, and cither is expelled by an eruption over the whole body, or is driven through the veins into the lower or upper belly, like an exile banished from a city that has been at civil war; and as it issues forth from the body, it causes diarrhea and dysentery and all diseases of that kind.

When a body has been stricken with sickness chiefly through excess of fire, it exhibits continued inflammations and fevers; excess of air causes quotidian fevers; excess of water tertian, because it is more sluggish than air or fire; excess of earth, which is by four measures most sluggish of all, being purged in a fourfold period of time, gives rise to quartan fevers, and is with difficulty banished.

Such are the conditions connected with diseases of the body; those of the soul depend upon bodily habit in the following way. We must allow that disease of the soul is senselessness; and of this there are two forms, madness and stupidity. Every condition then in which a man suffers from either of these must be termed a disease. We must also affirm that the gravest maladies of the soul are excessive pleasures or pains. For if a man is under the influence of excessive joy, or, on the other hand, of extreme pain, and is eager unduly to grasp the one or shun the other, he is able neither to see nor to hear anything aright; he is delirious, and at that moment entirely unable to obey reason.

In whomsoever the seed in the region of the marrow is abundant and fluid and like a tree that is fruitful beyond due measure, he feels from time to time many a sore pang and many a delight amid his passions and their fruits; and he becomes mad for the greater part of his life owing to the intensity of pleasures and pains, keeping his soul in a state of disease and derangement through the power of the body; he is not however regarded as sick, but as willingly vicious. But the truth is that incontinence in sensual pleasures is a disease of the soul for the most part arising from the fluid and moist condition of one element in the body owing to porousness of the bones. So it is too with nearly all intemperance in pleasure; and the reproach attaching thereto, as if men were willingly vicious, is incorrectly brought against them. For no one is willingly wicked; but it is owing to some bad habit of body and unenlightened training that the wicked man becomes wicked; and these are always unwelcome and imposed against his will. And where pains are concerned, the soul likewise derives much evil from the body. For where the humours of acid and salt phlegms and those that are bitter and bilious roam about the body and find no outlet to the surface, but being pent up within and blending their own exhalations with the movement of the soul are mingled therewith, they induce all kinds of mental diseases, more or less violent and serious: and rushing to the three regions of the soul, in the part which each attacks they multiply manifold forms of moroseness and melancholy, of rashness and timidity, of forgetfulness and dullness. And when, besides these vicious conditions, there are added bad governments and bad principles maintained in public and private speech; when moreover no studies to be an antidote are pursued from youth "up, then it is that all of us who are wicked become so, owing to two causes entirely beyond our own control. The blame must lie rather with those who train than with those who are trained, with the educators than the educated: however we must use our utmost zeal by education, pursuits, and studies to shun vice and embrace virtue. This subject however belongs to a different branch of inquiry.

The counterpart to what has been said, the treatment of body and mind and the principles by which they are preserved, were the proper and fitting complement of our discourse: for it is more just to dwell upon good than upon evil. All that is good is fair, and what is fair is not disproportionate. Accordingly an animal that is to be fair must, we affirm, be well-proportioned. Now the smaller proportions we discern and reason upon them; but of the greatest and most momentous we take no account. For in view of health and sickness and virtue and vice no proportion or disproportion is more important than that existing between body and soul themselves: yet we pay no heed to these, nor do we reflect that if a feebler and smaller frame be the vehicle of a soul that is strong and mighty in all respects; or if the relation between the two be reversed, then the entire creature is not fair; for it is defective in the most essential proportions. But the opposite condition Is to him who can discern it of all sights the fairest and loveliest. For example, a body which possesses legs of excessive length or which is unsymmetrical owing to any other disproportion, is not only ugly, but in taking its share of labour brings infinite distress on itself, suffering frequent fatigue and spasms, and often falling in consequence of inability to control its motions: the same then we must suppose to hold good of the combination of soul and body which we call an animal; when the soul in it is more powerful than the body and of ardent temperament, she agitates it and fills it from within with sickness; and when she impetuously pursues some study or research, she wastes the body away: and in giving instruction and conducting discussions private or public in a spirit of contention and rivalry, she inflames and weakens its fabric and brings on chills; and thus deceiving most of the so-called physicians induces them to assign causes for the malady which are really in no way concerned with it. When on the other hand a large body, too great for the soul, is joined with a small and feeble mind,—two kinds of appetites being natural to mankind, on account of the body a craving for nourishment and on account of the divinest part of us for knowledge—the motions of the stronger prevail and strengthen their faculty, but that of the soul they render dull and slow of learning and of recollection, and so produce stupidity, the most grievous of maladies. There is but one safeguard against both these misfortunes: neither should the soul be exercised without the body nor the body without the soul, in order that they may be a match for each other and attain balance and health. So the mathematician, or whosoever is intensely absorbed in any intellectual study, must allow corresponding exercise to his body, submitting to athletic training; while he who is careful in forming his body must in turn give due exercise to his soul, calling in the aid of art and of all philosophy, if he is justly to be called at once fair and in the true sense good. The same treatment too should be applied to the separate parts, in imitation of the fashion of the All. For as the body is inflamed and cooled within by the particles that enter, and again is dried and moistened by those that are outside, and by the agency of these two forces suffers all that ensues upon these conditions, if "we submit the body passively to the forces aforesaid, it is overcome and destroyed: but if we imitate what we have called the fostress and nurse of the All, and allow the body, if possible, never to be inactive, but keep it astir and, exciting continual vibrations in it, furnish it with the natural defence against the motions from without and within; and by moderately exercising it bring into orderly relation with each other according to their affinities the affections and particles that are going astray in the body; then, as we have already described in speaking of the universe, we shall not suffer mutually hostile particles to be side by side and to engender discord and disease in the body, but we shall set friend beside friend so as to bring about a healthy state. Of all motions that which arises in any body by its own action is the best (for it is most nearly allied to the motion of thought and of the All), but that which is brought about by other agency is inferior; and the worst of all is that which, while the body is lying still, is produced by other agents which move it piecemeal. Accordingly of all modes of purifying and restoring the body gymnastic is the best; the next best is any swinging motion such as of sailing or any other conveyance of the body which does not tire it: a third kind is useful sometimes under absolute necessity, but in no other circumstances should be employed by a judicious person, I mean medical purgation effected by drugs. No disease, not involving imminent danger, should be irritated by drugs. For every form of sickness has a certain correspondence to the nature of living creatures. Their constitution is so ordered as to have definite periods of life both for the kind and for the individual, which has its own fixed span of existence, always excepting inevitable accidents. For the triangles of each creature are composed at the very outset with the capacity of holding out for a certain definite time; beyond which its life cannot be prolonged. The same applies also to the constitution of diseases; if these are interfered with by medicine to the disregard of their appointed period, it often happens that a few slight maladies are rendered numerous and grave. Wherefore we should guide all such sicknesses by careful living, so far as we have time to attend to it, and not provoke a troublesome mischief by medical treatment.

Now so far as concerns the animate creature and the bodily part of it, how a man, guiding the latter and by himself being guided, should live a most rational life, let this discussion suffice. But the part which is to guide the body must beforehand be trained with still greater care to be most perfect and efficient for education. To deal with this subject minutely would in itself be a sufficient task: but if we may merely touch upon it in conformity with our previous discourse, we should find a consistent answer to the question from the following reflections. As we have often said, three forms of soul with threefold functions are implanted in us, and each of these has its proper motions. Accordingly we may say as briefly as possible that whichever of these continues in idleness and keeps its own motions inactive, this must needs become the weakest; but that which is in constant exercise waxes strongest: wherefore we must see that they exercise their motions in due proportion. As to the supreme form of soul that is within us, we must believe that God has given it to each of us as a guiding genius—even that which we say, and say truly, dwells in the summit of our body and raises us from earth towards our celestial affinity, seeing we are of no earthly, but of heavenly growth: since to heaven, whence in the beginning was the birth of our soul, the diviner part attaches the head or root of us and makes our whole body upright. Now whoso is busied with appetites or ambitions and labours hard after these, all the thoughts of his heart must be altogether mortal; and so far as it is possible for him to become utterly mortal, he falls no whit short of this; for this is what he has been fostering. But he whose heart has been set on the love of learning and on true wisdom, and has chiefly exercised this part of himself, this man must without fail have thoughts that are immortal and divine, if he lay hold upon the truth; and so far as it lies in human nature to possess immortality, he lacks nothing thereof; and seeing that he ever cherishes the divinest part and keeps in good estate the guardian spirit that dwells in him, he must be happy above all. And the care of this is always the same for every man, to wit that he assign to every part its proper exercise and nourishment. To the divine part of us are akin the thoughts and revolutions of the All: these every man should follow, restoring the revolutions in the head, that are marred through our earthly birth, by learning to know the harmonies and revolutions of the All, so as to render the thinking soul like the object of its thought according to her primal nature: and when he has made it like, so shall he have the fulfilment of that most excellent life that was set by the gods before mankind for time present and time to come.

Thus then the task laid upon us at the beginning, to set forth the nature of the universe down to the generation of man, seems well-nigh to have reached its fulfilment. For the manner of the generation of other animals we may deal with in brief, so there be no need to speak at length: thus shall we in our own eyes preserve due measure in our account of them. Let us then state it in this way. Of those who were born as men, such as were cowardly and spent their life in unrighteousness, were, according to the probable account, transformed into women at the second incarnation. At that time the gods for these reasons invented the love of sexual intercourse, in that they created one kind of animate nature in men and another in women, which two they formed in the following way. To the channel of the drink, where it receives the fluid passing down through the lungs beneath the kidneys into the bladder and sends it forth by pressure of the air, they opened a passage into the column of marrow which runs from the head down the neck and along the spine, and which we have already termed the seed. This, being quick with soul and finding an outlet, gave to the part where it found the outlet a lively desire of egress and produced a longing to generate. Wherefore the nature of the generative part in man is disobedient and headstrong, like a creature that will not listen to reason, and endeavors to have all its will because of its frantic passions; and again for the same reason what is called the matrix and womb in women, which is in them a living nature appetent of child-bearing, when it is a long time fruitless beyond the due season, is distressed and sorely disturbed, and straying about in the body and cutting off the passages of the breath it impedes respiration and brings the sufferer into the extremest anguish and provokes all manner of diseases besides; until the passion and love of both unite them, and, as it were plucking fruit from a tree, sow in the womb, as if in a field, living things invisible for smallness and unformed, and again separating them nourish them within till they grow large, and finally bringing them to light complete the birth of a living creature. Such is the nature of women and all that is female. The tribe of birds was transformed, by growing feathers instead of hair, from men that were harmless but light-minded; who were students of the heavenly bodies, but fancied in their simpleness that the demonstrations were most sure concerning them which they obtained through the sight. And the race of brutes that walk on dry land comes from those who sought not the aid of philosophy at all nor inquired into the nature of the universe, because they used no longer the revolutions in the head, but followed as their guides the parts of the soul that are in the breast. From these practices their front limbs and their heads were by their natural affinity drawn towards the ground and there supported; and their heads were lengthened out and took all sorts of forms, just as the orbits in each were crushed out of shape through disuse. For the same reason such races were made four-footed and many-footed; for God gave many props to the more senseless creatures, that they might the more be drawn earthward. As to the most senseless of all, whose whole bodies were altogether stretched at length on the earth, seeing they had no longer any need of feet, God made them footless to crawl upon the ground. And the fourth class that lives in the water was formed of the most utterly foolish and senseless of all, whom they that transfigured them thought not worthy even of pure respiration, because their soul was polluted with all manner of iniquity; but in place of inhaling the fine pure element of air they were thrust into the turbid and lowly respiration of water. Hence is the tribe of fishes and of all shell-fish that live in the water; which have the uttermost dwelling-place in penalty for the uttermost folly. In such manner then and now all creatures change places one with another, rising or falling with the loss or gain of understanding or of folly.

And now let us declare that our discourse concerning this All has reached its end. Having received all mortal and immortal creatures and being therewithal replenished, this universe hath thus come into being, living and visible, containing all things that are visible, the image of its maker, a god perceptible, most mighty and good, most fair and perfect, even this one and only-begotten world that is.

# The Timaeus.

Translated by Henry Davis.

SOCRATES, TIMÆUS, CRITIAS, HERMOCRATES.

Socrates:: One, two, three:—but where, dear Timæus, is that fourth of us who yesterday were your guests, but are entertainers now?

Timæus:: Some illness has befallen him, Socrates; for he would not willingly have missed such a meeting as the present.

Socrates:: It is your business, then, of yourself, and that of these present, to fill up the place of the absent guest.

Timæus:: Quite so, Socrates; and, as far as we can, we will not fail to do so: for it would be unjust for the rest of us, whom you yesterday so handsomely entertained, not to treat you with readiness in return.

Socrates:: Do you recollect, then, the magnitude and nature of the things on which I charged you to speak?

Timæus:: Some, indeed, we do recollect; but what we do not, you, who were present, can recal to our memory: or rather, if it be not too much trouble, once more briefly run over the whole from the beginning, that it may be the more firmly established in our minds.

Socrates:: Be it so. The sum of yesterday's discussion respecting a republic was, what form I thought the best, and of what sort of men it should be composed.

Timæus:: And indeed, Socrates, all that you said was quite according to our mind.

Socrates:: Did we not in the first place separate the class of husbandmen, and ever so many other artificers, from that of those who fight in defence of the state?

Timæus:: Yes.

Socrates:: And when we had assigned to every one that single employment which was suited to his own nature, and had prescribed to each his particular art, we bade the military caste confine themselves to the simple duty of protecting the state from the hostile incursions both of internal and external foes;—mildly to administer justice to their subjects, as being naturally friends, but fiercely to combat with such foes as might fall in their way.

Timæus:: Quite so, of course.

Socrates:: We asserted, I think, that the souls of the guardians should be naturally high-spirited, and at the same time remarkably philosophic, so as to enable them towards either friends or foes respectively to be gentle or severe.

Timæus:: You did so.

Socrates:: But what about their training? Did we not say that they ought to be instructed in gymnastic exercises, music, and other suitable branches of science?

Timæus:: Yes.

Socrates:: With respect at least to those thus trained, it was somehow said, that they should regard neither gold nor silver nor any such property, as their own private possession, but rather, like subordinates, should receive the wages of their guardianship from those whom they defend and preserve, their recompense being no more than sufficient for temperate men, and that they should spend their income in common, with a view only to mutual subsistence, bestowing their attention wholly on virtue, in preference to every other pursuit.

Timæus:: This too was so stated.

Socrates:: Respecting women, too, we asserted that their nature should be aptly conformed to resemble that of men, and that they should all engage in common with them, both in the duties of war and the other employments of life.

Timæus:: This too you alleged.

Socrates:: But what about the procreation of children? This perhaps you easily remember, on account of the novelty of the proposal; for we ordered that marriage-unions and children should be in common to all persons whatsoever, special care being taken also that no one should be able to distinguish his own children individually, but all consider all as their kindred; regarding those of an equal age, and in the prime of life, as their brothers and sisters,—those prior to them, and yet further back, as parents and grandsires,—and those below them, as their children and grandchildren.

Timæus:: Aye,—these things too, in the way you describe them, are easily remembered.

Socrates:: That they might at once acquire then the best possible natural disposition, I recollect that we decreed that the rulers, male and female, whom we placed over the marriage contract, should secretly contrive, through certain lots, that the worthy should assort only with the worthy, the base with the base,—and that no discord might arise from this connexion, we should refer all the blame of the union to fortune alone.

Timæus:: This, too, we remember.

Socrates:: We ordered, moreover, that the children of the good should be properly trained, but those of the bad secretly sent to the other part of the state, while of those who are constantly arriving at manhood, such as are found to be of a good disposition, should be recalled from exile; those, among them, on the contrary, who have proved themselves unworthy, being in their turn banished to the place occupied by those just promoted.

Timæus:: Just so.

Socrates:: Have we, then, sufficiently summed up yesterdays discussion; or do we need anything further, friend Timæus, that has been omitted?

Timæus:: By no means, Socrates; for these were the very things discussed.

Socrates:: You shall now hear some further details respecting the republic that we have described, and how I feel towards it. The feeling, then, seems to me somewhat similar to this,—as if some one, on beholding beautiful animals, either wrought by the gravers art, or really alive, but in a state of perfect rest, were to entertain a desire to behold them in motion, struggling, as it were, in those exercises which seem best suited to their bodies. Just the same do I feel towards that form of state which we have described; for I should gladly listen to any one who recited the story of the contests that one state engages in with others, when it ventures becomingly on war, and exhibits in the course of it a conduct worthy of its nurture and training, as regards both active encounters and verbal negotiations with individual states. On these points, indeed, Critias and Hermocrates, I am conscious of my own inability to praise the men and the state according to their desert; and that I should be so incapable is no wonder, is I have formed the same opinion respecting the poets both of the past and present age;—not that I despise the poet-tribe, but still every one must see, that being an imitative race, they most easily and in the best manner imitate those things in which they have been trained; while, on the contrary, whatever is unconnected with their training, is hard for them to imitate well even in actions, and in words even yet more difficult. And as for the tribe of Sophists, I deem them indeed mighty clever, both in multiplying words and many other fine accomplishments; yet I fear, as they have no settled abode, but wander through various cities, and dwell in no abode of their own, they will form false conjectures respecting both philosophers and politicians, as to the magnitude and nature both of the actions which they achieve in war, and of the words they employ in their mutual intercourse. The only people remaining, then, to whom I can apply, are those of your character and habit, versed both by nature and training in philosophy and political science. For Timæus here of Locris, in Italy, which is governed by the best of laws, being withal not inferior to any of his fellow-citizens in wealth and nobility, has in his own state attained to the highest official honours, and has likewise in my opinion reached the summit of all philosophy. Critias, too, as we all know, is not ignorant of the particulars that we are now mentioning;—and respecting Hermocrates also, we have ample testimony for the belief that he is both by nature and education well suited to all these pursuits. Hence, when I perceived yesterday your great anxiety to discuss the formation of a republic, I was much pleased at it, being well aware, that if you pleased, none could better unfold the successive points for discussion;—inasmuch as, by properly adapting the state for warlike purposes, you would be the only person in the present age who could supply it with all things becoming its constitution. Having spoken, then, in compliance with your request, I now require you, in your turn, to comply with mine; and, as a matter of course, you have agreed to carry on the discussion among yourselves in common and so forthwith repay my hospitality with the feast of reasoning. Here, therefore, am I arrayed for the purpose, and readiest of all to partake of the promised banquet.

Hermocrates:: Aye, truly, Socrates, as Timæus here just observed, neither will we lack zeal in fulfilling your desire;

nor will we offer any excuse for neglecting it; since only yesterday, just after leaving this, when we went to the lodging of Critias, where both there and before that on the way thither, we discussed this very subject. He here then unfolded to us a story from ancient tradition, which—prythee, Critias, even now repeat to Socrates, that he may judge whether or not it concerns his demand.

Critias:: This we must surely do, if agreeable to Timæus, our third partner in this discussion.

Timæus:: I, for my part, fully consent.

Critias:: Listen now then, Socrates, to a story very strange indeed, yet in every respect true, as it was once related by Solon, the wisest of the seven sages of Greece. He was the kinsman and intimate friend of our great-grandfather Dropides, as he himself often tells us in his poems; and he Dropides informed our grandfather Critias as the old man himself in turn told us, that this state had formerly achieved great and admirable actions, the knowledge of which nevertheless had been lost through lapse of time and the decay of mankind,—one act in particular being more illustrious than the rest,—in remembrance of which it were fitting, that we should not only return you thanks, but also in full assembly hymn forth to the goddess our true and just acclaim of praise.

Socrates:: Well observed:—but what is this achievement, which Critias described as having been net only related by Solon, but really accomplished by this state in days of yore?

Critias:: I will acquaint you with that ancient story, which I indeed received from no mere youth; for at that time Critias, as he himself said, was almost ninety years old, and I myself about ten; and it chanced then to be the time of the *Cureotis Apaturiorum* The boys indeed were then going through the ceremonies customary with them at this festival;—for our parents proposed prizes for singing verses; and therefore a multitude of verses of many poets were recited, and many of us especially sang the poems of Solon, as being at that time new. Then one of our tribe, whether it was his real opinion or he wished to gratify Critias, said he thought Solon not only the wisest of men in matters generally, but as regards poetry the most noble of all poets. On hearing this, the old man for I well remember it was exceedingly pleased, and said, laughing—'If Solon, oh Amynander, had not considered poetry as a mere amusement, but made it, as others do, a serious employment, and so completed the history which he had brought from Egypt; and, had not been forced to relinquish it by the seditions and numerous other troubles in which he found his country involved, I do not think that either Hesiod, Homer, or any other poet, would have acquired more distinguished renown.' 'And what was that story, Critias?' asked he. 'One about an action,' replied he, 'the greatest and most celebrated, which this state ever achieved; although, through lapse of time and the death of those by whom it was undertaken, its fame has not descended to our own day.' 'Tell it,' said he, 'from the beginning; and say what that was, which Solon asserted as true, as well as how and from whom he heard it.'

'In Egypt.' said he, 'in the Delta, about the summit of which the streams of the Nile are divided, is the district νομός surnamed Saitical; the chief city of which is Sais, whence also came the king Amasis; and it had a presiding divinity, whose name is in the Egyptian tongue Neith, which they say corresponds with the Greek Athena; and the people profess to be great friends of the Athenians, and united with them in a sort of close alliance. Solon said that on his arrival thither, he was very honourably received;

and, especially, on his inquiring about ancient affairs of those priests who possessed superior knowledge in such matters, he perceived that neither himself nor any one of the Greeks so to speak had any antiquarian knowledge at all. And once on a time desirous of inducing them to narrate their ancient stories, he undertook to describe those events which had formerly happened among us in days of yore,—those about the first Phoroneus and Niobe, and again after the deluge of Deucalion and Pyrrha as described by the mythologists, together with their posterity, paying due attention to the different ages in which these events are said to have occurred:—on which one of their extremely ancient priests exclaimed, "Solon, Solon, you Greeks are always children, and aged Greek there is none." Solon, on hearing this, replied, "How can you say this?" To whom the priest, "You are all youths in intelligence; for you hold no ancient opinions derived from remote tradition, nor any system of discipline that can boast of a hoary old age:—and the cause of this is the multitude and variety of destructions that have been and will be undergone by the human race, the greater indeed arising from fire and water, others of less importance from ten thousand other contingencies. The story, for instance, that is current among you, that Phaeton, the offspring of the Sun, once attempting to drive his father's chariot, and not being able to keep the track observed by his parent, burnt up the surface of the earth, and perished himself, blasted by lightning, is generally regarded as fabulous, but in point of fact it refers to a declination or parallax of the heavenly bodies revolving round the earth, and indicates that, at certain long intervals of time, the earth's surface is destroyed by mighty fires. When this occurs, then those who dwell either on mountains, or in lofty and dry places, perish in greater numbers than those dwelling near rivers, or on the sea-shore;—whereas to us the Nile is not only our safeguard from all other troubles, but liberates and preserves us also from this in particular;—and again when the gods, to purify the earth, deluge its surface with water, then the herdsmen and shepherds on the mountains are preserved in safety, while the inhabitants of your cities are hurried away to the sea, by the impetuosity of the rivers. In this our country, on the other hand, the waters neither then fell, nor ever have fallen from above upon the plains, but on the contrary are naturally driven upwards from the earth's interior:—and to these causes it is owing, that the most ancient things are said to be here preserved. The truth is, however, that in all places where there is neither intense cold nor immoderate heat, the race of man is always found to exist, sometimes in less, sometimes in greater number. And all the noble, great, or otherwise distinguished achievements, performed either by ourselves, or by you, or elsewhere, of which we have heard the report,—all these have been engraven in our temples in very remote times, and preserved to the present day; while, on the contrary, with you and all other nations, they are only just committed to writing, and all other modes of transmission which states require,—when again, at the usual period, a current from heaven rushes on them like a pestilence, and leaves the survivors among you both destitute of literary attainments and unacquainted with music;—and thus you become young again, as at first, knowing nothing of the events of ancient times, either in our country or yours. As for the transactions, indeed, Solon, which you have just related from your antiquities, they differ but little from puerile fables:—for in the first place you only mention one deluge of the earth, whereas there had been many before; and in the next place you are unacquainted with that most noble and excellent race of men, who once inhabited your country, from whom you and your whole present state are descended, though only a small remnant of this admirable people is now remaining,—your ignorance in this matter resulting from the fact that their posterity for many generations died without the power of speech through the medium of letters; for long before the chief deluge, a city of Athenians existed, regulated by the best laws both in military and all other matters, whose noble deeds and civil institutions are said to have been the most excellent of all that we have heard to exist under heaven.”

‘Solon, on hearing this, expressed his admiration, and exhibited the most ardent desire, entreating the priests to relate to him accurately and in order the whole history of his ancient fellow-citizens. And then one of the priests replied, “I have no objection, Solon; and for your sake, and that of your city, I will relate the whole, and more particularly on account of that goddess, to whom is assigned the guardianship both of your state and ours, and by whom both have been founded and fostered; yours indeed having a priority over ours of a thousand years, from having received its origin from Hephæstus and the Earth; and the annals even of our own city Sais have been preserved eight thousand years in our sacred writings. I will briefly describe, then, the laws and more illustrious actions of those states which have existed nine thousand years; and when we are more at leisure, we will take the sacred writings themselves, and recount an exact history of every particular.

“‘Now, consider the laws of these people, as compared with those prevailing here; for you will find here even at the present day many examples of institutions that formerly existed in your city. First of all, the priests passed their life separate from all the rest; and next, the artificers so exercised their crafts, that each followed his own employment without mingling with any other class of workmen. The same method was likewise adopted with shepherds, hunters, and husbandmen. The soldiers, too, you will find, were separated from other kinds of men, and were enjoined by the laws to engage in nothing but war. The armour, too, which each employed, such as shields and darts, resembled that which we used first of all the Asiatics,—the goddess in those places, as she did to you, first pointing out their use. Again, with respect to wisdom, you may perceive what attention the law paid to it even from the first, as likewise to all that respects the universe, including even divination and medicine, that conduces to the preservation of health; and from these, which are divine things, the inquiry proceeds to human affairs and all other branches of learning therewith connected. Such then was the principle of distribution and arrangement on which the goddess first founded and established your state, choosing for that purpose the place in which you were born; because she foresaw that from its excellent temperature, the region would produce men of the most consummate wisdom; and, the goddess, of course, being a lover both of wisdom and war, selected a spot likely to produce men most resembling herself; and fixed on this first as their settled abode. You proceeded to settle, then, under the protection of such like laws, and what is more, under good government, surpassing all men likewise in every virtue, as becomes the descendants and disciples of the gods.

"'Many and mighty deeds of your state, then, are here recorded in writing in our sacred records, and call forth our admiration; nevertheless there is one in particular, which in magnitude and valour surpasses them all;—for these writings relate what a prodigious force your city once overcame, when a mighty warlike power, rushing from the

Atlantic sea, spread itself with hostile fury over all Europe and Asia. That sea indeed as then navigable, and had an island fronting that mouth which you in your tongue call the Pillars of Hercules; and this island was larger than Libya and Asia put together; and there was a passage hence for travellers of that day to the rest of the islands, as well as from those islands to the whole opposite continent that surrounds that the real sea. For as respects what is within the mouth here mentioned, it appears to be a bay with a kind of narrow entrance; and that sea is indeed a true sea, and the land that entirely surrounds it may truly and most correctly be called a continent. In this Atlantic island, then, was formed a powerful league of kings, who subdued the entire island, together with many others, and parts also of the continent; besides which they subjected to their rule the inland parts of Libya, as far as Egypt, and Europe also, as far as Tyrrhenia. The whole of this force, then, being collected in a powerful league, undertook at one blow to enslave both your country and ours, and all the land besides that lies within the mouth. This was the period, Solon, when the power of your state was universally celebrated for its virtue and strength;—for, surpassing all others both in magnanimity and military skill, sometimes taking the lead of the Greek nation, at others left to itself by the defection of the rest, and brought into the most extreme danger, it still prevailed, raised the trophy over its assailants, kept from slavery those not as yet enslaved, insured likewise the most ample liberty for all of us without exception who dwell within the Pillars of Hercules. Subsequently, however, through violent earthquakes and deluges which brought desolation in a single day and night, the whole of your warlike race was at once merged under the earth; and the Atlantic island itself was plunged beneath the sea, and entirely disappeared;—whence even now that sea is neither navigable nor to be traced out, being blocked up by the great depth of mud which the subsiding island produced."

The above, O Socrates, is the sum of what the elder Critias repeated from the narration of Solon:—and when yesterday you were discoursing about a republic and the citizens composing it, I was reminded to my surprise of what I have now mentioned; for I perceived how divinely, as it were, by a kind of good luck, and without wandering from the mark, you in most respects coincided with Solon's statement. Still I was unwilling to disclose these particulars immediately; since, from the long lapse of time since I first heard them, I did not remember them with sufficient accuracy for repetition. I considered, therefore, that I ought, before relating it, first of all to rehearse the whole diligently to myself. And this was why I yesterday speedily complied with your demands, conceiving, as is most important in such matters, that we ought not to lack ability to present a discourse suited to the object in view. Hence was it, as Hermocrates here observed, that as soon as we left here yesterday, I brought up the subject before my friends here, in order to refresh my memory; and by afterwards meditating on it at night, I acquired nearly a complete recollection of the whole story. According to the proverb, indeed, what we learn in childhood takes a wonderful hold on the memory:—for with respect to myself, for instance, I am not certain that I could recall the whole of yesterday's discourse, though I should be very much astonished if anything that I had heard a very long time ago were to escape my remembrance. What I then heard, indeed, was listened to with great pleasure and delight; and the old man very readily recounted it, even when I frequently asked for a repetition; and thus the story became like the brands of indelible writing fixed in my memory. Well then, as soon as it was day I repeated the narrative to my friends, that they might aid me in fairly recounting my story. Now, therefore, as respects the object of all that has been said, Socrates, I am prepared to relate, not only the general heads, but the particulars also of all that I heard. As for the citizens and state which you described to us yesterday as in a fable, we will now convert it into a reality, and consider the state established by you as no other than this of Athens, and the citizens which you described as no other than those real ancestors of ours, alluded to by the Egyptian priests. Indeed they will harmonize in every respect; and we shall not be far from the mark in asserting that your citizens are the very people who existed at that time. Each taking our share then in this discussion, we will try our utmost to bestow suitable attention to the task that you have assigned us. It is requisite therefore to consider, O Socrates, whether this narrative answers our purpose, or we should seek some other in its stead.

Socrates:: And what other, O Critias, can we receive in preference to this, which, from its affinity, is extremely suitable to the festival of the goddess, and has the all-important merit of being not a cunningly devised fable, but a true history? It is impossible, therefore, to say, how and whence, if we abandon your narrative, we should find another more suitable. We cannot; but must acknowledge that you have been happy in your narration; and, as for me, after my discourse of yesterday, I will now rest, and be in my turn a listener.

Critias:: Consider then, Socrates, the arrangement of this banquet of yours, how we settled it. For we think it right that Timæus, who is the most astronomical of us all, and has bestowed much pains in acquainting himself with the nature of the universe, should be the first to discourse to us, beginning from the creation of the world, and ending with the nature of men;—and also that I after him, receiving from him, as it were, the men which have been ideally produced—and some of them, too, excellently educated by you,—should introduce them among us here, according to the word and law of Solon, as to proper judges, and make them members of this city; as being really those very Athenians of bygone days, which were described as unknown to us in the report of the sacred writings;—and so, in future, we will treat them in our discourse as citizens and Athenians.

Socrates:: I am now, it seems, to be plentifully and splendidly entertained in my turn with a banquet of arguments:—it is for you, then, O Timæus, to begin the discourse, having first of all invoked the gods according to the usual custom.

Timæus:: Well, Socrates, this at any rate is true,—that those who have even the least share of wisdom, always invoke the deity on entering every undertaking, whether small or great; and so we likewise unless we be in every respect unwise who are now about to speak concerning the universe, whether it be generated or without generation, shall if we be not very unwise make it our first duty to invoke the gods and goddesses, and pray that what we speak may be first of all pleasing to them, and also in consistence with ourselves. And as respects the invocation of the gods, so have I acted for myself; while as respects ourselves, we must lead you by that way which you may most easily understand, and which will best enable me to explain my meaning about the proposed subjects of discussion.

I think we ought, in the first place, to define what that is which is ever-existent, and has no generation; and what that is which is in a state of generation or becoming, but never really is. The former of these, indeed, which is apprehended by reflection united with reason, always subsists according to sameness;—while the latter is perceived by opinion united with irrational perception; since it subsists in a state of generation and corruption, and never really is. And, again, whatever is generated is necessarily generated from a certain cause; for it is wholly impossible that anything should be generated without a cause. An artificer, therefore, of anything, if he looks to that which always subsists according to sameness, and from this as a sort of pattern, works out the form and nature of his work, he must thus, necessarily, produce something wholly beautiful:—but where he employs for his pattern only what is generated, it cannot be beautiful.

Let this universe then be called *heaven*, or *the world*, or by any other name that it usually receives; and let us, in the first place, consider respecting it, what ought to be investigated at the very outset of our proposed inquiry about the universe,—whether it always existed, having no beginning, or was generated, beginning from some certain commencement. It is generated;—for this universe is palpable, and has a body; and all such things are perceptible *i.e.* are to be apprehended by the senses; and things perceptible being apprehended by opinion, in conjunction with perception, appear to be in a state of becoming, and subject to generation. Again, with reference to what exists, it must necessarily have arisen from some cause.

To discover then the *Creator* and *Father* of this universe, as well as his work, is indeed difficult; and when discovered, it is impossible to reveal him to mankind at large. And this too, we must consider respecting him, according to which of two patterns he modelled the world; whether with reference to one subsisting ever in a state of sameness and similarly affected, or with reference to one that is only generated. If this world then is beautiful and its artificer good, he evidently looked to an eternal pattern; but if it be without beauty, and what it is not lawful to mention, he must have looked to one that is generated. It is evident, however, to every one that he looked to one that was eternal;—for the universe is the most beautiful of generated things, and its artificer the best of causes. Being thus generated, then, it has been framed according to principles that can be comprehended by reason and reflection, and ever abides in sameness of being. This, then, being the case, this world must necessarily be the resemblance of something;—although to describe its origin according to nature is the greatest of all undertakings. We should distinguish between an image and its pattern; just as words are connected with the things of which they are the interpreters:—and so when we speak of that which is stable and firm, and mentally intelligible, our language should be in like manner stable and immutable, and as far as possible unrefutable and immovable, having in this respect no deficiency; whereas, in speaking concerning its image only, and as compared to it, we should use probable arguments, that are in strict analogy thereto. Moreover, precisely as essence or true being is to generation, so is truth to faith or mere conjecture. You must not wonder, then, O Socrates, since different people differ so much in opinion about the gods and the formation of the universe, if I should be unable to put forth generally approved and scrupulously exact statements on so difficult a subject; but even if we should only advance reasons not less probable than those of others, you should still be content, remembering that both I who am speaking, and you who are my judges, possess a common human nature; and you must be satisfied therefore, if my assertions are but probable statements, and should inquire no farther.

Socrates:: Capitally well said, Timæus; and we must proceed wholly as you recommend. As regards the prelude then of your discourse, we wonderfully approve of it: and now proceed to the strain or main subject itself.

Timaeus:: Let us declare then on what account the framing Artificer settled the formation of this universe. He was good; and in the good, envy is never engendered about anything whatever. Hence, being free from this envy, he desired that all things should as much as possible resemble himself. Any one, therefore, who receives this as the leading principle of generation and the universe from intelligent men, will receive it most correctly. For as the deity desired, as far as possible, that all things should be good, and nothing evil,—he accordingly took everything that was visible and not in a state of rest, but in excessive agitation and disorder, and then reduced it from disorder into order, conceiving the latter to be far better than the former. It is not, indeed, and never was, lawful to do anything else but what is most honourable; and accordingly, he found by reasoning that of things naturally visible, nothing without intelligence could be more beautiful than what is wholly endowed with intellect, and besides this, that apart from the soul no one could possess intelligence. In pursuance of this reasoning, placing intellect in soul and soul in body, he constructed the universe; that thus it might be a work naturally the most beautiful and the best. Hence, therefore, we have a reasonable motive for calling the world an animal with a soul, truly intellectual, and created through the providence of the deity.

This being the case, let us next consider, in the likeness of what animals the composing artificer framed the universe. We must by no means then think, that he would deign to fashion it like animals subsisting as a part of anything *i.e.* in an incomplete form: for nothing resembling an imperfect animal can possibly be beautiful. But we may consider it on the other hand, as most nearly of all resembling what contains the other animals both separately and collectively as parts of a whole—for it the universe comprises within itself all intelligible animals, just as this world contains us and all other visible creatures. The deity, indeed, desirous of making it in all respects resemble the most beautiful and entirely perfect of intelligible objects, formed it into one visible animal, containing within itself all the other animals with which it is naturally allied. Are we not, then, right in concluding that there is but one heaven or universe; or is it more correct to assert that there are many and infinite? One only, I answer, if it has been fabricated according to the original pattern. For that which comprehends all intelligible animals whatever, can never be second to any other:—for there would be need of another animal again to comprise these two, of which they would both be parts; and it would be more proper to assert that the universe resembles this comprehending third, rather than the other two. In order, therefore, that the world may in its substantive existence κατὰ τὴν μόνωσιν resemble the all-perfect animal—on this account the framer of the worlds produced neither two nor an infinite number; but this, the solely-begotten heaven or universe having been generated, now exists and ever will exist.

Now, whatever has been generated, must necessarily have bodily shape, and be visible as well as tangible. But nothing can be visible without the aid of fire, and nothing tangible without something solid, and nothing solid without earth,—owing to which, the deity at the beginning of his constructive labour composed the body of the universe from fire and earth. But it is not possible for two things alone to cohere, without the intervention of a third; for a certain bond is necessary between the two. And the best of all bonds is that, which, as nearly as possible, unites into one both itself and the natures bound with it. But proportion will naturally best show this effect;—for whenever, either in three numbers, or solids, or powers, the middle bears the same ratio to the last, as the first to the middle—and again also, as the last is to the middle, so is the middle to the first; then the middle or mean term becoming both first and last, and the last and first again each become means, they must thus all necessarily become the same relatively to each other, and having become the same with each other, will all be one. If then the body of the universe had been a superficies only without thickness, one medium alone would have sufficed, both for binding it and all that belongs to it;—but in the present case, as it was doomed to be a solid—and solids are never one only, but always jointed together by two media,—whence the deity placed water and air between fire and earth;—and by thus placing them as far as possible in proportion to each other, so that fire should be to air as air to water, and as air to water so water to earth,—he thus bound and framed together the world visible and tangible. On this account also, and from such elements, which are four in number, the body of the universe was confessedly generated by a certain proportion; and hence has resulted such an intimacy, that all its parts aptly cohere, and are indissoluble except by its uniting artificer.

Of these four elements, then, the composition of the world received one whole of each:—for its composing artificer constituted it from entire elements of fire, water, air, and earth; leaving no part of any one of them, nor any extraneous power,—considering that it would thus be a whole animal, in the highest degree perfect and of perfect parts; and besides this, that it would be one, as nothing would be left, from which any other such element could be produced; and lastly, that it would be free from old age and disease,—and perceiving also that the principles composing bodies, as heat and cold, and all possess vigorous powers, when they surround bodies externally and interfere with them unseasonably, dissolve their union, and bring on diseases and old age, whereby they decay and perish. Owing to such causes and reasonings, then, he framed this universe, as one whole, an united series of perfect wholes, perfect, undecaying, and without disease. He gave it also a figure becoming and allied to its nature:—and to the animal destined to comprehend all others within itself, that figure as the most becoming, which includes within itself every sort of figure whatever. Hence he fashioned it in the shape of a sphere, perfectly round, having its centre everywhere equally distant from the bounding extremities, as being the most perfect of all figures, and most resembling himself;—and be did this, considering the similar to be infinitely more beautiful than the dissimilar.

Next, he most carefully polished the external circumference of this sphere,—and this for many reasons. It needed, indeed, neither eyes, nor ears, as there was nothing externally either visible or audible:—neither was it surrounded with air, as if it required respiration;—nor, again, did it require any organ, through which it might receive its nutriment, and discharge it again when digested: for nothing was either added to or taken from it, that being impossible. Indeed the universe is artfully made to provide itself with nutriment through its own decay, as well as to suffer and do all things in itself, and by its own operations;—because, indeed, its creator conceived that it would be much more excellent, if independent in action, than if it required extraneous aid. And he did not think fit to give it hands either, as it had nothing either to receive or reject; nor yet of feet, or any other members suited to locomotion:—for he assigned to it a motion peculiar to itself, being that of all the seven kinds of motion, which chiefly belongs to intellect and reflection. Hence, making the world to turn constantly on itself and on the same point, he gave it a circular motion, and took from it all the other six, without giving it any power of progression: and as this revolution required no feet, he created the world without legs and feet.

Thus was it, that the intelligence of the eternal Deity, after due reflection, conceived the form of the god about to come into existence; and he made it smooth, equable, and even from its centre in every direction,—a body whole and perfect, wholly composed out of perfect bodies. As for the soul, he fixed it in the middle, extended it throughout the whole, and likewise surrounded with it its entire surface:—and so, causing a circle to revolve in a circle, he established the world as one substantive, solitary object, self-sufficient through its own excellence, requiring nothing external, but sufficiently known and friendly to itself. By this procedure, then, he produced the Universe, a blessed god. The Deity, however, did not, as we now undertake to say, form the soul posterior and junior to the body: for he who conjoined these, would never have allowed the more ancient nature to be governed by the younger:—and yet we, who are exposed to the blind chances of fortune, are apt to speak somehow in this silly fashion; whereas the Deity constituted the soul both in age and excellence prior to and older than the body, as being the proper mistress and ruler of its subject the body; and that, too, from the following sources, and in the following manner.

From one essence indivisible, and always the same, and from another again that is divisible and corporeal, he composed—by admixture from both—a third form of essence intermediate between the two; and again, between what is indivisible and divisible as respects bodies, he placed the nature of *same* and *different* or mutable;—and taking these three, he mingled them all into one idea, joining them together by force, as the different would not freely mingle with the same. And after mingling them with essence, and producing one from the three, he again distributed this whole into suitable parts; each composed of a mixture of same, different, and essence. He next began to divide as follows:—In the first place, he took away one part from the whole; then he separated a second part, double of the first: and again, a third, one-and-a-half times as much as the second, but triple of the first; then a fourth, double of the second; in the next place a fifth, triple of the third: a sixth, octuple of the first: and lastly a seventh, twenty-seven times greater than the first. After this, he filled up the double and triple intervals, still taking off parts therefrom, and so placed them between the intervals, that there might be two media between every interval; one of which might, in the same degree, exceed one of the extremes, and be exceeded by the other, while the other part might in an equal degree exceed one of the extremes, and be exceeded by the other. But as by the intermediate links between the above-mentioned spaces the sesquialter, sesquitertian, and sesquioctave intervals were produced, he filled with a sesquioctave all the sesquitertian intervals, leaving a part of each, the interval between which and the following would have to each other the same ratio as the numbers 256 and 243; and in truth he thus exhausted the whole mixture—from which these were separated. He split the whole of this composition, then, along its entire length into two parts, joining them mutually across like the letter X, afterwards bending them into a circle, and connecting them both with themselves and each other, in such a way that their extremities might meet directly opposite the point of their mutual intersection, externally comprehending them in an uniform motion around the same centre; besides which, he made one of the circles external, the other internal. The motion of the exterior circle he proclaimed to be that of sameness, and that of the interior the motion of difference. He caused also the circle of sameness to revolve laterally towards the right, and that of difference diagonally towards the left. And the superiority he gave to the circulation of same and similar; for this alone he suffered to remain undivided;—while, as to that within, after dividing into six parts, and forming therefrom seven unequal circles, divided by double and triple intervals, three of each, he bade these circles travel in contrary directions to each other,—three of the seven to revolve at equal velocities, the remaining four with a velocity unequal as respects either of the former three, yet in a certain proportion as to their respective periods.

After, therefore, the whole composition of the universal soul had been completed according to the intention of God who framed it, he in the next place formed within it the whole of a corporeal nature; and he aptly jointed them, by uniting centre to centre. The former the soul, being interwoven throughout from the middle to the very extremities of space, and covering it even all around externally, though at the same time herself revolving within herself, originated the divine commencement of an unceasing and wise life throughout all time. And indeed the body of the universe was generated in visible shape; while the soul, though invisible, was made to partake of reason and harmony, and rendered the best of created things by

Him—the best of eternal intelligences. The soul, then, being composed from the admixture of the three parts, same, different, and essence, classified as well as bound together in certain proportions, and itself revolving inwardly on itself, whenever it comes in contact either with anything mutable or indivisible, at once declares by its intrinsic energy with what anything is identical, and from what it differs, and also with reference to what, where, how, and when it happens, both as regards its own separate essence and its external affections, either in things generated, or such as possess an eternal sameness. When our talk, then, is about truth, and consistent with itself,—whether, on the one hand, it be about things mutable or things constant, and is silently and noiselessly borne onward by its own motion, or when it is concerned about things sensible, and the circle of difference reports on its onward passage to every part of the soul, then arise fixed and true opinions and persuasions:—but when, on the other hand, it is concerned about the merely rational, and the glibly-whirling circle of sameness makes its indications,—then intellect and science are thus necessarily brought to full perfection. And as respects the real essence in which these two qualities are engendered, if any one asserts that it is any other than the soul, he will assert everything rather than the truth.

When the parent Creator perceived that this created image of the eternal gods had life and motion, he was delighted with his work, and by this very delight he was led to consider how he might make it still more to resemble its exemplar. Hence, as the *intelligible* universe was an eternal animal, he tried to make this the *sensible* universe, as far as he could, similarly perfect. The nature indeed of the animal itself was eternal, and this nature could not be entirely adopted into any thing subject to generation;—

hence God resolved to form a certain moveable image of eternity; and thus, while he was disposing the parts of the universe, he, out of that eternity which rests in unity, formed an eternal image on the principle of numbers;—and to this we give the appellation of *Time*. But besides this, he contrived the days and nights, months and years, which had no existence prior to the universe, but rose into being contemporaneously with its formation. All these are but the parts of time; and the terms *it was* and *it will* be are generated *i.e.*, varying and evanescent forms of time, which we have wrongly and unawares transferred to an eternal essence. For we say that a thing was, is, and will be; while according to truth, the term *it is*, is alone suitable,—*was* and *will be* being expressions only suitable to generation, which proceeds through time,—both of them being certain motions:—whereas, what exists eternally, the same and immoveable, neither becomes at any time older or younger; neither has it been generated in the past, nor will be in the future, nor is it subject to those accidents which generation imposes on sensible objects,—all of which are nothing more than forms of time imitating eternity, and moving in a circle measured by number. And besides this, in making such assertions as these,—that what has been generated is generated,—that what is becoming, is in generation,—that what will be is to be,—and that non-being is not;—in all this we state what is not accurately true. But this is perhaps not the place for a minute discussion of these matters.

Time, then, was generated with the universe, in order that, being produced together, they might together be dissolved, if their dissolution should ever happen:—and it was formed on the model of an eternal nature, that it might as far as possible resemble it; for this model exists through all eternity, while the world, on the other hand, has been generated, now exists, and will exist, throughout all time. With this design, then, and after such reflection on the generation of time, the Deity, in order that it might be produced in full operation, created the sun, moon, and the five other stars, which are denominated planets, to distinguish and guard over the numbers of time. And as soon as he had produced the bodies of these stars, God placed them, seven in number, in the seven orbits whose revolutions are according to difference;—the Moon, indeed, in the first orbit nearest about the earth; the Sun in the second beyond the earth; then Lucifer *i.e.* Venus, and the star sacred to Hermes *i.e.* Mercury, revolving in their orbits as swiftly as the sun, but on a different principle of motion, owing to which these stars, the Sun, Lucifer, and Mercury, mutually overtake and are overtaken by each other in their respective courses. As respects the other stars, however, the labour of investigating their revolutions, and the causes that gave them origin, would surpass that of the discourse itself which caused their mention. These subjects, then, may hereafter, perhaps, when we have leisure, meet with the investigation they deserve.

When, therefore, each of the stars necessary for the constitution of time had obtained a motion adapted to its condition, and their bodies, bound by living chains, had become vital beings and learned their prescribed duty, they pursued their course according to the movement of difference, passing obliquely through the orbit of sameness, to which the former is subordinate, one circle being larger and the other smaller, one moving quicker and the other more slowly; those that revolved the quickest on the principle of sameness appearing ever to overtake and be overtaken by those that travelled at slower velocities. And the revolutions of all these circles in their orbits with a spiral motion, proceeding at one and the same time in two contrary directions, make it appear that the one moving at the slowest pace from that which was the most swift is the nearest of all. And in order that there might be a certain apparent measure of slowness and swiftness in the relative velocities of these spheres, and an evident uniformity in all the eight movements, the Deity enkindled a light, which we now denominate the sun, in the second of these orbits, in order that it might fully display all things in the universe, and that such animals as required it might have their share in number, becoming acquainted therewith from the revolution of sameness and similarity. Thus, then, and on these accounts, arose night and day; being the period of the one and most skilfully-contrived movement. The month, too, was generated, when the moon had run through her orbit, and passed into conjunction with the sun,—and the year, when the sun had completely travelled through his own orbit. As to the periods of the other stars, however, they are not understood, except by a very few; nor are they distinguished by any peculiar name or relatively measured on the principle of numbers:—and hence it may be said, they are ignorant that these movements really constitute time, infinite as they are in number and of wonderful variety. Still it is by no means impossible to conceive, how the perfect number of time completes a perfect year, when the courses of the eight orbits return at their completion to the same place of commencement, and have their revolution measured on the principle of sameness. In this manner, indeed, and for this purpose, were formed such of the stars as moved circularly through the universe,—that this the visible animal, *i.e.* the universe might resemble as nearly as possible the most perfect intelligible animal, in the imitation of an eternal nature.

The Creator constructed all the rest at the same time as the generation of time, according to the similitude of that which has been portrayed; but still, as the universe did not yet comprise within it the entire animal race, in this respect there was a dissimilarity. This defect, therefore, the Creator supplied by impressing it with forms corresponding with the nature of its pattern. Wherever, therefore, the intellect beholds ideas of a certain quality, and quantity in that which possesses life, such and so many he conceived that this the universe should contain; and these are four:—One, the heavenly race of gods; another, winged and air-wandering race; a third, that which dwells in the water; and a fourth, that which has feet and walks on the ground. The chief idea, indeed, of deity, he formed from fire, that it might be as far as possible splendid and fair to behold; and in adapting it to the universe, he rendered it circular; made it to consist in the knowledge of that good which it is to follow, and distributed it round the entire heavens, that it might be a true world, fully adorned with that race in its every part. To each of the divine bodies, also, he adapted two motions;—one of them taking place on the same spot and on the principle of sameness, corresponding with that intelligence which contemplates what is the same with itself; the other, a progressive motion subordinate to the motion that is constantly the same and similar:—but as respects the other five motions, it was fixed immoveable, that each of them might become as far as possible the best. And for this reason also the fixed stars were formed, as being divine and eternal animals, ever abiding and revolving in the same place and on the principle of sameness; and the stars, which both revolve and have the kind of motion above described, were formed on those principles. Next, he formed the earth our common nourisher, which, being confined round the axis that extends through the universe, is the guardian and artificer of night and day, as well as the first and most ancient of the gods that have been generated within the universe. With respect, however, to the dances or rhythmical motions of these divinities, and the mutual intersection of their circles, as well as their relative revolutions and progressive motions in their conjunctions and oppositions, whether in progressive or retrograde motion, at what times and in what manner they are in turn eclipsed, and afterwards reappear to our view, causing terror and presaging future events to such as are able to understand them;—to attempt an explanation of all this, without having a plan of them before us, would be a labour in vain. But of this enough; and this is all that we shall say concerning the nature of the visible and generated gods.

Again, to speak concerning the other gods or dæmons, and to know their generation, is more than we can perform; and we must trust to the reports of those ancient men, who being, as they said, the descendants of the gods, must have a clear knowledge of their parents. It is impossible, therefore, to discredit the children of the gods; and even though they should speak without probable and cogent proofs, yet as they declare that they are relating matters with which they are familiarly acquainted, we ought, in compliance with the law, to assent to their tradition. In this manner, then, according to them, the generation of these gods took place, and is described.

Ocean and Tethys were the progeny of Heaven and Earth; and from these sprang Phorcys, Kronos, and Rhea, and ever so many more with them;—and from Kronos and Rhea sprang Zeus, Hera Jupiter, Juno, and all that we know are called their brethren, together with others still who were their progeny. When therefore all such gods as visibly revolve, and show themselves when they please, were generated, the Artificer of the universe thus addressed them: “Gods of gods, of whom I am the creator and father, all things formed by me are by my will indissoluble. Indeed, what is bound is of course dissoluble; nevertheless, to desire to dissolve what is beautifully harmonized and well disposed, is the mark of an evil nature. Now, inasmuch as you have been generated, you are hence not immortal, nor wholly indissoluble; yet you shall never be dissolved, nor become subject to the fatality of death; because you have got my will that it shall be so, which is a much greater and more powerful bond than those by which you were bound when first created. Learn, therefore, what I now say to you by way of information. Three classes of mortals yet remain uncreated. Unless these be created, then, the universe will be imperfect; for it will not contain within it every kind of animal, though it ought, in order to be quite perfect. Yet if these are generated, and partake of life through me, they will become equal to the gods. In order, then, that mortal natures may subsist, and the universe may be truly all, turn yourselves, according to your nature, to the formation of animals, imitating the power which I employed in the creation of yourselves. And so far as any part of these is suited to have the same name as immortals to be called divine, and destined to take the lead among those who willingly pursue justice, and reverence you—of these I myself will deliver the seeds and beginnings; and for the rest do you weave together the mortal and immortal nature, constructing and generating animals, and promote their growth too by supplying them with food, and receive them back again into your bosom when fallen to decay."

Thus spoke the Creator; and again into the same bowl, in which he had by mingling tempered the soul of the universe, he poured into it likewise what was left of the former mixture, somewhat indeed after the same manner, yet not equally pure as at first, but less so by two or three degrees. And after having thus framed the universe, he allotted to it souls equal in number to the stars, inserting each in each; and then, as it were, placing them on a vehicle whereon to travel through the heavens, he pointed out the nature of the universe, and announced to them the laws of fate; showing them that the first generation would be allotted in common to all, so that no particular soul should have less than its due portion, and that after they had been distributed through the several instruments of time adapted to each, there would then be produced that animal which is of all the most suited for religious worship; and as human nature was of two kinds, male and female, he showed them that the more excellent was that which would afterwards be called man. As souls, therefore, are from necessity engrafted in bodies that are constantly gaining and losing their composing particles, he declared to them that in the first place all persons must necessarily have one connate ξύμφυτον sense produced by violent emotions,—secondly, love mingled with pleasure and pain; and besides these, fear and anger, together with all their consequences and natural opposites; and that such as subdued these would live justly, those overcome by them unjustly. And he declared also, that after living well for the time appointed to him, each one should once more return to the habitation of his associate star, and spend a blessed and suitable existence; but failing in these points, he should be changed in his second generation into the nature of a woman; and should he not cease from evil even under these circumstances, whatever the shape his wickedness had taken, so also the soul should be changed into the nature of some brute corresponding thereto, and when changed never cease from labour, until, following the revolution of sameness and difference peculiar to itself, and having overcome by reason its turbulent and irrational part, which is a mass, as it were, composed of fire, water, air, and earth, it should at length return to the first and best disposition of its nature.

Having thus legislated for souls in all these particulars, in order that he might be in no respect the cause of the future wickedness of each, he planted some of them on the earth, others in the moon, and others in the remaining different instruments of time; and after this planting, he charged the junior gods with the duty of constructing mortal bodies, as well as everything additional that was required for the human soul, giving them dominion also over these and all things consequent thereon, and bidding them rule over the mortal creature as nobly and honourably as they could, that it might not become the cause of evil to itself.

The Creator, after arranging all these particulars, then retired to his accustomed repose; and while he thus abode, his children forthwith obeyed their father s order, and, taking the immortal principle of a mortal animal, they, in imitation of their own creator, borrowed from the world portions of fire and earth, water and air, as things which they should one day restore; and firmly united them together, not with the same indissoluble bonds by which they themselves were held together, but fixing them with thickly-set nails, invisible through their smallness, constructing from these different elements each particular body, and placing the revolutions of the immortal soul in a body subject both to renewal and decay. These, however,—merged, as it were, in a deep river,—had no power of governing themselves, but violently hurried forward both themselves and others, so that the whole animal was moved—confusedly however, just as chance carried it forward, and without any reason, according to the whole six kinds of motion—backwards and forwards, to the right and left, upwards and downwards, and so on, according to the six differences of place. And great as was the advancing and retiring wave which furnished nutrition, yet it was still more agitated by the impulses which it received from without, when the body came into collision with external and foreign fire, or the solidity of earth, liquid waterfalls, or whirling blasts of air; from all which the various movements fell through the body on to the soul; which on this account were afterwards, and are still, called perceptions *i.e.* general sensations. And these, moreover, instantly giving rise to an exceedingly great and powerful motion, by moving with that constantly flowing stream, and vehemently disturbing the revolutions of the soul; wholly stopped the revolution according to sameness by their contrary current, hindering it either from commencing or continuing its course;—and even the movement according to difference they so far disturbed, as to turn from their circular orbits and throw into all possible disorder the three intervals of double and triple, together with the mean terms and conjoining links of the sesquitertian, sesquialter, and sesquioctave ratios, which cannot be dissolved by any one but the artificer by whom they were bound;—and thus, though scarcely connected with each other, they are borne along, though quite in disorder,—at one time straight forwards, at another obliquely, and then again upside down, just as if one were to fix his head on the earth and raise his feet on high, in which case, both to the inverted person and the spectators, the parts on the right would seem to be on the left, and the left on the right. These circles likewise greatly disturbed in these and similar ways, when they fall in externally with either sameness or difference, and call objects either same or different, contrary to truth, become false and unreasonable; nor is there any revolution among them which has a controlling and directing power;—and if, again, any of the external sensations are hurried forward and join in doing violence to the soul's whole receptacle, they then seem to prevail, though in reality they are still in subjection.

And it is owing to all these affections, that even now as in the beginning, the soul, when first united to a mortal body, is without intelligence; but when the stream of growth and nutrition flows along with diminished speed, the circles of the soul, restored to tranquillity, proceed in their proper path, gaining steadiness as time goes on, and then the orbits of the circles are regulated in their course agreeably to those that travel according to nature; and they call both same and different by their proper appellations, assigning wisdom to the person by whom they are possessed. If any one, therefore, receives both proper food and education, he must become perfectly sound and healthy, escaping every important disease; whereas he who neglects his soul will pass lamely through life's existence, and again pass into Hades aimless and unserviceable. Of these matters, however, more hereafter. It is our business at present to treat more accurately of what we before proposed,—namely, the generation of body in connexion with soul, and owing to what causes and divine foresight it has taken place, resting for our proofs chiefly on the argument of analogy.

First, then, the gods, in imitation of the spherical shape of the universe, bound the two divine circles of the soul in a spherical body,—that, namely, which we now call the head, which is man's most divine member, and the ruler of our whole composition. And to this the gods who framed it gave the whole body for its service, conceiving that it would thus partake of every possible motion; and moreover, lest the head, in rolling over the various elevations and depressions, should be unable to overcome the heights, or get out of the cavities, the gods gave it the body to be its locomotive vehicle. Hence the body was endued with length, and furnished by Divine contrivance with four members, naturally capable of extension and flexion, to enable it to seize objects, to give it a stable support, and to allow it to pass from place to place; and above this body was placed the head, the abode of our most divine and sacred portion. This was why we were furnished with legs and hands;—and as the gods considered that the fore parts are more honourable and fitter to rule than those behind, they gave us a motion chiefly progressive. Beside this, it was requisite, that man's front should be distinct and dissimilarly formed from the other side; and on this account they first placed about the vessel of the head a face provided with organs to express all the energies of the soul, and assigned to this anterior part the natural government of man. And of these organs, the first that they constructed were the light-bearing eyes, fixing them in from some such cause as the following: The body of these eyes they formed to consist of fire, not enough indeed to burn, but to give a gentle light suitable to each day; for the pure fire contained within us and related to it, they caused to flow smoothly through the eyes, and in dense quantities throughout, but condensing it more especially in the middle of the eyes, so as to conceal all the grosser part within, and allow the pure only to filter through. When, therefore, the light of day surrounds the stream of vision, then, by the mutual falling of similar bodies on each other, one well-adapted body is constituted, according to the direction of the eyes, wherever the light proceeding from within resists that which falls on it from without. But the whole becoming similarly affected through similitude, when it either touches anything else or is itself touched by another, then the motion thus produced, diffusing itself through the whole body even as far as the soul, causes that sensation which we denominate sight. But when this kindred fire within us departs into night, the sight is cut off; for in this case, by proceeding into a dissimilar nature, it becomes estranged, and is extinguished: since it has no longer any relation to the proximate surrounding air, which is naturally destitute of fire. Hence it ceases from seeing, and besides this, becomes the introducer of sleep; for the gods constructed the eyelids to be a preservative of the sight, and thus by their compression restrain the power of its inward fire, and besides that, scatter and smooth over its internal motions; and when they are thus calmed, rest ensues; which rest, when profound, produces a sleep attended with few dreams;—but on the other hand, if certain unusually vehement motions remain, then, according to their nature and the places in which they occur, they will engender corresponding phantasms within, which will come to our recollection as soon as we wake. With respect, also, to the formation of images on mirrors, and all lucid, smooth surfaces, there is nothing in these difficult of solution; for all such phenomena necessarily result from the mutual affinity of the external and internal fire, and again from one in particular that subsists about smooth bodies individually, and is many times reflected, because the fire around the face gradually becomes united on the smooth and shining surface with the fire coming from the eyes. The parts on the right, too, appear to be on the left, because there is a mutual contact of the contrary parts of the sight with the contrary parts of the object, different from their accustomed mode of approach. On the contrary, the parts on the right appear on the right, and the left on the left, when there is a reflexion of the light composed of the mingled fires, both exterior and interior; and secondly, the smoothness of the mirrors, which are convex, reflect that which is to the right on the left, and the left to the right. But if the mirror be concave, it presents an image wholly inverted, by sending the lower part of the image upwards, and again the upper part downwards. All these phenomena, therefore, are only some of the concurring causes which the divinity brings to his aid in rendering the idea of that which is best as far as possible complete,—whereas the multitude are of opinion that these are not the concurring but the real causes of all things,—such, namely, as those producing cold and heat, freezing and thawing, and such like, but which are wholly incapable of exercising reason and intellect; for the soul may be said to be the only one of all beings that can acquire intellect; and this is invisible, whereas fire and water, air and earth, are all visible bodies. As for the lover of intellect and science, however, he should explore the first causes of intellectual nature, and consider, respecting second causes, how many arise from the motion of other bodies, and yet necessarily give motion again to others. This, then, is what we ought to do: we should speak concerning both kinds of causes, but separately of such as engage the intellect in forming things fair and good; and of such, also, as, abandoning wisdom, produce the things they form just as it may chance, and without any regard to order.

Respecting the second causes of the eyes, therefore, so far as they possess the power which falls to their lot, let what has been already said suffice; and we will next speak of their greatest and most useful employment, for which, indeed, they were expressly bestowed on us by the Deity. The sight, indeed, is in my opinion the cause of the greatest benefit to man,—since even in our present discussion about the universe, not one argument could ever have been adduced without surveying the stars, the sun, and the heavens. Now, however, both day and night, months and periods of years, have been seen and arithmetically calculated; and they give us a conception of time, and means of investigating the nature of the universe; from all which we have gained that kind of learning termed philosophy, a better gift than which never was nor ever will be conferred by the gods on our mortal race. This, then, is what I call the greatest benefit of the eyes; and as for the others that are of less consequence, why should I celebrate them, to make those who are blind and unphilosophic mourn and regret them in vain? This, however, we may assert, that God invented and bestowed sight on us for this express purpose, that on surveying the circles of intelligence in the heavens, we might properly employ those of our own minds, which, though disturbed when compared with the others that are uniform, are still allied to their circulations; and that having thus learned and being naturally possessed of a correct reasoning faculty, we might by imitating the uniform revolutions of divinity set right our own silly wanderings and blunders.

As respects voice and hearing, we may say again, that they were bestowed on us by the gods for the same objects and on the same account; for speech was ordained for the very same purpose as the sight, which it greatly aids in its office;—and it is with a view also to harmony that the hearing has an aptitude for musical sounds. That harmony, moreover, which consists in motions analogous to the revolutions of our soul, does not seem advantageous to him who wisely devotes himself to the Muses on the mere ground of its being pleasurable without reason, as it seems at present; but it was given us by the Muses to aid us in reducing the disturbed circulation of our soul to mutual order and accordance;—and again, they gave us rhythm for the same purpose, as the means of reforming the irregular and ungracious habits that prevail in the majority of our race.

Thus far, with only a few exceptions, our past remarks have had reference to the creations of intellect; and we ought to speak likewise of things that come of necessity: for the generation of this world results wholly from the co-operation of intellect and necessity. Intellect indeed, ruling over necessity, persuaded it to bring to the highest perfection the majority of created things; and in this way, by the persuasive power of wisdom over necessity, this universe was first created. Now, correctly to explain in what way it was created, we must refer in our explanation to the form of a variable cause, as the nature of the case requires. Let us then recall our steps, and take up the subject afresh, going back to first principles, as we did before. Let us investigate then the nature and affections of fire and water, air and earth, prior to the generation of the heavens; for up to the present time no one has yet unfolded their generation:—and yet we speak of fire and other things as principles and elements of the universe, just as if the nature of each was known;—whereas at the same time any one with the least intelligence must be aware that they cannot be compared even to letters or parts of which syllables are formed. As respects ourselves, this is what we propose:—we will not speak of the principle or principles, or whatever other denomination they may receive, of all things;—and this for no other reason than the difficulty of stating what are my sentiments according to our present method of discussion. Do not expect me then to speak thus, for I cannot persuade myself that I have the ability to undertake so difficult a subject. Keeping, therefore, to the line of argument laid down at the beginning, on the force of probability, I will endeavor to make statements not less probable than those of others, and beginning the subject once more from its commencement to discourse on the matter both in detail and as a whole. First, then, invoking the divinity who has now from the first been the guardian of our discourse, to defend us from an absurd and unusual exposition and lead us to a doctrine founded on probability—let us again begin to speak.

This fresh commencement then, of our present discussion requires a more ample division than the former. For then we distinguished only two species; but we must now admit a third. In the former discussion two were sufficient;—one set forth as a species of model, apprehensible by the intellect, and always subsisting on the principle of sameness,—the second an imitation of the model, generated and visible; and we did not then distinguish a third, because we deemed these two sufficient. But now the subject of discourse seems to compel me to introduce and explain a new species which is both difficult and obscure. Of what natural power, then, are we to conceive it possessed? It is indeed in some sort the special receptacle, and, as it were, the nurse of all generation. Such indeed is the truth:—but we must speak more clearly concerning it. And this will certainly be an arduous undertaking on many accounts, but principally on account of the questions that must previously be settled concerning fire and the rest of the elements,—why one should be called water rather than fire, or air rather than earth, or why any one of them should bear one name in particular rather than all the rest; thus rendering it a difficult matter to use a language about it that is fixed and stable. How then, and by what means, are we to arrive at a probable conclusion in this dilemma?

In the first place, then, what we now denominate water, on becoming condensed, seems to take the form of stones and earth,—and when melted and dispersed, that of vapour and air;—air also, when burnt up, becomes fire, while the latter again, on becoming condensed and extinct, resumes the form of air; and again air, when collected and condensed, produces mists and clouds, from which, when still more compressed, rain descends; and from water again are formed earth and stones;—the whole of them, as it seems, exchanging all round their mutual generation.

As these, then, never maintain any constancy of existence, who will have the assurance to maintain that any one of them is *this* rather than *that*? No one:—and it would be far the safest plan to speak about them as follows:—When we see anything constantly passing from one state of existence to another, as fire for instance, we should not say that it is fire absolutely, but something fiery,—and again, that what we call water is not absolutely so, but something watery; without assigning to them any names that would give the idea of stability, as we think people do, when they express it by this and that τόδε καὶ τοῦτο;—for not being of an abiding nature, it cannot endure to have applied to it such terms as, this thing, of this nature, belonging to this; and any such others as would show it to have a substantive existence. Hence we should not give any one of them an individual name, but call it something such-like, but ever fluctuating; and especially with respect to fire, we should assert that it is wholly such-like, and similarly likewise, everything endued with generation. That receptacle, however, in which each of these appears successively to grow up and decay, that alone is entitled to be termed this and that;—whereas anything of any kind soever, as hot, white, or their contraries, and all therefrom proceeding, cannot be so denominated. But let us again try more clearly to explain our meaning. If any one, in modelling all kinds of figures out of gold, were unceasingly to transform them one by one into all the others, and some one present were to point to one of them and inquire what it was, it would be by far the safest and most correct to say that is gold; but as for its being a triangle, or any other figure that might be given to it, not to speak of them as being so in reality, inasmuch as they are in process of change, even while we make such assertion; but to be content if it may safely be denominated such-like, or of such a nature. The same remark applies to that which receives all bodies;—and we should ever call it by the same name, as it never abandons its own proper power, but perpetually receives all things, and never anywhere or in any way assumes any of those shapes that enter into it,—being in fact a natural receptacle for everything, receiving both motion and form from what enters therein; and this is why it exhibits a different aspect at different times. But as for the representations of the objects that enter and depart hence, they are modelled after them in a manner wonderful and difficult to describe, as we shall hereafter relate.

For the present, then, we must consider three things:—first, that which is produced,—the second, that in which it is produced,—and the third, that of which the thing produced is the natural resemblance. And especially is it proper to compare that which receives to the mother *i.e.* which supplies the model, that from which it receives to the father, and the nature intermediate between these to the child; and to consider, also, that as the image should present every possible variety of forms, that in which the model is formed cannot well be prepared for the purpose, unless those forms have been erased from it which it used to receive from other quarters. Indeed, if it were like any of the objects that enter into it, if aught were to present itself of a nature contrary and wholly different, it would produce a bad likeness thereof. And hence from presenting at the same time its own image, that which is destined to receive within itself all the different species possible, should itself be destitute of all form whatever;—just as those preparing sweet-smelling unguents take all pains to render wholly inodorous the liquids that are to receive the perfume,—and as those also who wish to impress figures on a soft substance carefully remove from it any previous impression, and make it, as far as they can, exquisitely smooth and well-polished. In the same way, then, that which is intended properly to receive through its entire extent the resemblances of eternal beings, should be naturally without any form whatever of its own. Hence, as to this mother and receptacle of things created, which is visible and every way perceptible, we cannot term it either earth, air, fire, or water,—nor again, any one of their compounds, or any of the elements from which they were produced; but we should not be at all wrong in calling it a certain invisible and shapeless essence, which receives all things and has a certain share of intelligence,—though how it has it, is a matter very obscure and difficult of apprehension. So far, however, as it is possible to arrive at its nature from what has been previously said, we may very correctly say that fire appears to be something inflamed, water something moist,—and so in like manner, earth and air, so far as it receives the images of these bodies.

Let us, then, be somewhat more minute in resolving the following question,—whether there is a certain fire subsisting in itself,—and so also, as respects other things which we always say have a separate existence in themselves, whether the objects alone that we see, and which are perceived through the bodily organs, possess reality of being, and nothing besides these has any existence at all,—or whether we are wrong in asserting that each of them has its corresponding idea, when after all it is nothing but idle talk. The present question, therefore, we must not decide without much judicious examination;

neither should we add to our present discourse any great length of matter not strictly belonging to the subject:—but if there should appear to be any limit, by which it can be contained within a small compass, that would of all things be the most opportune to our present design.

Thus, then, will I state my opinion. If intellect and true opinion are two separate kinds of things, there must necessarily be self-existing ideas not perceptible by the senses, and to be apprehended only by the intellect; but if, as appears to some, true opinion differs in no respect from intellect, everything perceived through the body should be considered perfectly real. We must consider them, then, as two distinct things, because they both have a separate origin and character, one of them produced in us by learning, the other through persuasion,—one always based on true reason, the other irrational,—the one not to be moved by persuasion, the other subject to such mutation:—and lastly, of true opinion every man has a share; but of intellect only the gods, and some small portion of mankind.

Such being the case, we must acknowledge that there is an idea which subsists according to sameness, unproduced and not subject to decay; receiving nothing into itself from elsewhere, and itself never entering into any other nature, but invisible and imperceptible by senses, and to be apprehended only by pure intellect; while the second, on the other hand, which is like it, and bears the same name, is perceptible by the senses, the effect of production, ever in motion, coming into being in a certain spot, and then again hastening to decay, being apprehended by opinion united with perception. Again, there is a third class of being,—that of eternal place; which is never destroyed, but becomes a seat or receptacle for everything created, being perceptible of itself without the interference of the senses, by a sort of bastard reason, though scarcely to be relied on; and hence seeing it, as in a dream, we assert that every being must necessarily be somewhere, and in a certain place, and that nothing can exist which is neither on earth or in the heavens. With regard to all these, and such like opinions and the ideas which are entertained in a waking state and have a positive existence, we cannot, owing to this dreaminess, clearly distinguish the one from the other, and state what is the fact,—that the image, which cannot claim as its own that even for which it is formed, but is ever borne along as the spectre of something else, must consequently be formed in something else, and somehow vindicate to itself a separate essence, if it has any existence at all;—whereas, with regard to real being, true and accurate reason aids it by affirming, that as long as two things differ from each other, they cannot so exist one in another, as to be at the same time two things and one only.

This, then, is a summary of my opinion,—that there are three distinct things which existed before the formation of the universe, *being*, *place*, and *generation*;—that the nurse of generation, moistened and inflamed, receiving the forms of earth and air, and experiencing all the other accidents thereon consequent, appeared under many various aspects; but as it was contained by powers neither similar nor equally balanced, it could not possibly be balanced itself, and through the want of such balance, became itself impelled by these forces, to which it again in turn gave impulse; while the parts in motion were separately hurried along in different directions, like things shaken and winnowed by sieves πλοκάνων and machines used for the cleansing of corn, the dense and heavy particles in one direction, those that are light settling in another quite different. Thus when these four classes were agitated by their receptacle, which was itself moved as by the shaking of the above-mentioned instrument, there was a separation of the dissimilar parts, and a crowding together of those most alike; in consequence of which these other things also occupied a different position, before the universe was created and from such materials reduced to order. Before this, indeed, they all subsisted irrationally, and without measure;—but when the Creator undertook to arrange the universe, he first gave shapes with forms and numbers to fire and earth, water and air, which possessed indeed certain traces of their true essence, though, nevertheless, wholly so situated, as everything would probably be, in the absence of its god. And let us above all things hold, and ever hold, that the Deity made them as far as possible the most beautiful and the best, when before they were in a totally different condition. Now, then, I will try to show you the distribution and generation of these things individually by a somewhat unusual mode of proof; but yet, as you have trodden the paths of mathematical learning, through which we must necessarily make our demonstration, you will not fail to follow me.

First, then, that fire and earth, water and air, are bodies, is evident surely to every one. But every species of body possesses solidity; and every solid must necessarily be contained by planes. Again, a base formed of a perfectly plane surface is composed from triangles. But all triangles are originally of two kinds, each of them having one angle a right angle, and the two others acute:—and one of these has an equal part of a right angle divided by the equal sides; while in the other, two unequal parts of a right angle are divided by the unequal sides. This, then, we lay down, according both to probability and necessity, as the origin and principle of fire and all other bodies;—but as for the heavenly principles thereof, these indeed are known only to the Deity, and to those among men who enjoy God’s favour.

We must relate, then, of what kind those four most beautiful bodies were that thus came into being, and which, however unlike each other, may yet be produced from each other by dissolution. By accomplishing this, indeed, we shall ascertain the truth about the generation of earth and fire, as well those elements *i.e.* water and air which in their just proportion hold an intermediate position; for then we shall allow no one to assert that there are visible bodies more beautiful than these, each of which belongs to a separate class. It must be our endeavor, therefore, to unite together these four kinds of bodies so excellent in beauty, and so prove to you that we have sufficiently apprehended their nature. Of the two triangles, indeed, the isosceles has but one form, while the oblong or scalene admits of infinite variety. We must select, therefore, the most beautiful among the infinites, if we would begin and proceed in due order:—still if any one can prove that he has found any form yet better and more suitable for the composition of these bodies, he shall be treated not as an enemy but a friend, and his opinion shall prevail. As for us, however, we fix on one only as the most beautiful of all the many triangles, passing over all the rest;—that out of which is formed a third, the equilateral triangle. To explain the reason of this would indeed require a somewhat lengthened proof:—nevertheless we propose a handsome reward for him who by a diligent investigation finds this not to be the case. We select, therefore, two triangles out of many, from which the bodies of fire and the other elements have been constructed,—one being an isosceles, the other one always having the square of its longer side the triple of that of the shorter.

But what we formerly asserted rather obscurely, we must now more accurately define. For all the four kinds of elements seemed to be mutually generated among each other from not being correctly represented; for there are generated from the triangles which we have just chosen, four kinds of solid figures—three of them, indeed, from one having unequal sides, and the fourth alone constructed from the isosceles triangle. All of them, therefore, cannot, by dissolution into each other, produce from many small things a few that are large,—this being effected only by three of them; for all things whatever naturally arise from one only, and when the greater parts are dissolved, many small parts will be formed out of them, receiving figures suitable to each; and again, when the numerous small parts are dispersed into triangles, a single number is formed, and the entire bulk constitutes one separate body of large size. Thus much then may suffice concerning their mutual generation.

We must speak next in order concerning the quality of each class individually, and show from what composition of numbers each was formed. The first, then, indeed, is that composed from the smallest triangles, its element being that which has its subtending side twice the length of the shorter. Now, two of these triangles being mutually brought together to form a diagonal diameter, and this being thrice repeated, so that the diagonals and shorter sides shall meet in the same point, as in a centre, the result will be one equilateral triangle composed of six triangles. But four equilateral triangles form by the union of three plane angles one solid angle, the size of which exceeds that of the most obtuse plane angle; and thus by forming a figure that comprises four of these angles, we constitute that first species of solid, the tetrahedron, which divides into equal and similar parts the entire sphere in which it is inscribed. The second species of solid, the octahedron, is formed from the same triangles, which unite to form eight equilateral triangles, and form one solid angle from four plane angles, six solid angles being requisite to constitute this second class of solids. The third, the icosahedron, is formed from the union of one hundred and twenty elements, so united as to form twelve solid angles, each formed by five plane equilateral triangles, and it has for its bases or faces twenty equilateral triangles. These are the only solids that can be formed from this element, viz. the scalene triangle. It was the isosceles triangle, however, that produced the fourth elementary figure,—four of them being so united with their right angles at the centre, as to form one equilateral four-sided plane; and six of these again united forming eight solid angles, each of which is formed by the combination of three plane right angles;—the figure of the body thus composed being cubical, having six plane quadrangular equilateral bases. There was yet a certain fifth combination, the regular dodecahedron; and this the Deity employed in tracing the plan of the universe.

Should any one then, after careful consideration of all these points, be at a loss to determine whether the number of worlds is infinite or finite, let him consider that to admit an infinite number thereof, would be the notion only of one who is ignorant of all that he should best know. Still it may with much propriety be questioned whether there is in reality only one world, or whether there are five. According to our opinion, indeed, which is founded on probable reasoning, there is but one world; though others perhaps, regarding the question in another point of view, may be of a different opinion. Let us now leave alone further speculations of this kind, and returning to the elementary forms that have now been created in our discussion, let us assign them respectively to fire, earth, water, and air. To earth, indeed, let us assign a cubical form; for of all the four kinds earth is the most immoveable, and is of all bodies the most easy to model,—such being necessarily the case with that which has the most secure bases. Among the triangles, then, that we originally mentioned, that which has equal sides possesses firmer bases than one having unequal sides; and of the two equilateral plane figures thus formed, the square has necessarily a firmer base than the triangle, whether considered with reference to its parts or the whole. On this account, in assigning this figure to the earth, we still preserve probability;—and we shall do this also by assigning to water that figure which is the least moveable of the whole, to fire that which is most so, and to air that which is intermediate between the two,—assigning also the smallest body to fire, the greatest to water, and to air one of a size intermediate between fire and water;—and again, the most subtile body to fire, the next in this respect to air, and the third to water. Among all these then, that body which possesses the fewest bases must necessarily be the most easily moveable, as well as most penetrating, and in every way most acute, being also exceedingly light, from being composed of the smallest possible number of elements:—and so also the second has these properties in a secondary degree, and the third in the third degree. Let it be agreed then, that, according both to strict and probable reasoning, the solid form of the pyramid is the element and germ of fire; that the second form described is air; and the third water. All these elements then, we must conceive to be so minutely small, that the individual parts of each kind may from their smallness escape notice, and yet when many of them are collected together, they become from their bulk the objects of our perception. Moreover, as respects their relative proportions, numbers, motions, and other properties, the Deity, so far as the nature of necessity has willingly and obediently given way, has firmly established and united them together in just proportion.

From all then that we have before said about the nature of these bodies, the following account seems to be the most probable:—Earth, when it meets with fire, and is dissolved by its subtility, is borne along hither and thither in a dissolved state either in the fire itself, or in the air, or in the water,—till its parts, meeting together, and again mutually harmonizing, once more become earth; for they can never take any other form. But water, when divided by fire or air, may, by the re-composition of its parts, become either one body of fire, or two bodies of air;—and as for the air, when it is decomposed, one only of its particles will produce two of fire. And again, likewise, when fire receives into itself either air or water or earth, though in small quantities relatively to the mass which contains it, if it be dragged along by the movements of these bodies and overcome in spite of all resistance, and at last be decomposed and broken in pieces, these two bodies of fire will coalesce into one of air; and if again the air is overcome and separated into parts, then from two wholes and a half there will be formed one whole body of water. Again, let us consider this matter as follows:—When any one of the other forms is enclosed by fire, and is cut by the acuteness of its angles and sides, it escapes further division by passing into the nature of fire:—for among bodies that are uniform and similar to each other, no one by itself can cause any change in one of the same class, or experience any itself, with respect to that which it resembles; whereas, when one class of bodies is contained within another, and the weak one contends with the stronger, it will not fail to be destroyed. And again, when the smaller, being comprehended in the greater, and the few by the many, are broken in pieces and extinguished, if they be disposed to adopt the form of the prevailing nature, they cease to be extinguished; and air becomes generated from fire,—water from air:—but if they attack and fall into contention with any of the rest that they may meet, the agitated parts continue to be dissolved, till being every way repulsed and dissolved, they fly to their kindred nature; or else, being overcome, and joined into one out of many similar to the prevailing power, they abide there in familiar union. And especially, as the result of these affections, all things whatever are mutually changing their positions;—for the numerous individuals of each class are distinguished according to their respective places through the motion of their receptacle, while those that are mutually dissimilar, but yet resemble others, are hurried on by the concussion of other bodies to the place occupied by the bodies they resemble. All unmixed and primary bodies then are generated from such causes as these:—but that other classes of bodies are naturally inherent in these forms, is owing to the composition of each rudimental part στοιχεῖον; which not only at first produces one triangle, possessed of a certain magnitude, but others also, both greater and smaller, equal in number to the various classes existing in the forms themselves;—and hence, these being mingled with themselves and each other, are infinite in their variety,—a fact which every one should consider, who means to argue with probability respecting the nature of things.

Concerning motion, then, and position, unless a person can clearly understand in what manner and in conjunction with what these two take place, he will meet with many hindrances in the subsequent part of this discourse. This matter indeed we have already partly discussed; but besides this, we must still inquire whether it be true, that motion never willingly resides in smoothness, inasmuch as it is difficult, or rather impossible, to conceive the existence of anything moving without a mover, or of a mover without something in motion;—motion being impossible while these are away, and it being equally impossible that these should be equable and smooth. Thus, then, we must assign a state of rest to smoothness, and motion to that which is unequal and rough; inequality indeed being the cause again of a rough uneven nature. Now, as regards the generation of inequality, that we have already discussed; but how the several bodies, when divided according to their classes, do not cease from their mutual courses and motions, this we did not explain:—and so we will once more make it the subject of inquiry. The revolution of the universe, since it comprehends the various classes of things, and is of circular shape and naturally desirous of uniting with itself, compresses all things together, and suffers no place to remain void. On this account is it, that fire most of all penetrates through everything, and air, in the next degree, being second to the former in subtility and tenuity;—and the rest in the same way according to their degree—for such as are composed of very large parts have a very large vacuity in their composition,—those, on the contrary, that are very small, a very small vacuity. The union, then, resulting from compression drives together the small parts into the intervals of the larger; and thus, the small parts being placed side by side with the large, the smaller dividing the greater, while the latter compress the smaller, they are all borne upwards and downwards to the places respectively suitable to each;—for each, on changing its magnitude, changes its position likewise: and so, from these causes the production of diversity is constantly maintained, giving that perpetual motion to these bodies, which both now subsists and ever will continue.

In the next place, we must understand that there are many kinds of fire;—as for instance, flame,—that which emanates from flame, which without burning furnishes light to the eyes,—and that which abides in ignited bodies, even after the flame has been extinguished. In like manner, with respect to air, one kind is of the greatest purity, that denominated æther—a second most turbulent, cloudy, and dark; and besides these, there are other nameless kinds formed by the inequality of the triangles. As respects water, again, it admits of a twofold division, one kind being liquid, the other fusible. The liquid kind, therefore, being composed of very small and unequal parts of water, becomes moveable, both of itself and by other bodies, through the inequality of its com position and peculiar shape of its figure; whereas the fusible kind, which is composed of large and smooth parts, is more stable than the former, as well as heavier and more compact, owing to its smoothness;—and when fire enters into and dissolves its substance, it becomes more moveable, from losing its uniformity; and when it is thus rendered easily moveable, and is repelled by the surrounding air, and extended on the earth, it is said to be liquefied, by way of expressing the division of its masses, and is said to *flow* also, in order to show its extension over the earth:—and these two words express both the changes which it undergoes. Again, when fire escapes from this body, it does not retire into a vacuum, but the surrounding air repelled by the fire drives the easily-moveable mass of moisture into the place before occupied by the fire, with which at the same time it becomes mingled;—but when the mass by close compression once more becomes equable and smooth, it then resumes its smoothness and consistency, because fire, the artificer of inequality, has taken its departure;—and this departure of fire we denominate cooling, while the union that takes place without the presence of fire is termed a *condensation* or hardening. But among all those which we term fusible fluids, there is one that becomes most dense, though formed from the most subtile and equable parts, and is of an uniform character, and partaking of a lustrous yellow colour:—it is that most highly prized possession,—gold, which is produced by filtration through a rock. And a node ὄζος of gold, rendered by its density very hard and turned black, is called adamant. But that which consists of parts greatly resembling gold, and has more than one species, which surpasses gold in density, and that it may become the harder, contains but a small and insignificant portion of earth, though at the same time it is lighter, owing to the great intervals between its internal atoms;—this is a separate kind of lustrous and dense fluids, termed *brass*. But an earthy nature is therewith mingled, which, when through age the two parts become separated soon becomes visible of itself, and is denominated *rust*. All other such matters also, it would be no hard task further to discuss by pursuing the plan of probable arguments;—and any one, who by way of recreation interrupts for a while his reasonings on eternal being, and enters into probable speculations about the generation of material things, will by these means acquire a pleasure of which he need not repent, and establish for himself a moderate and wise recreation during life.

Thus indulging ourselves, let us next recount certain probable reasons concerning what next follows of the same subject. Water that is mingled with fire, which being very thin and moist, takes its name ὑγρὸν from its motion and the manner in which it rolls on the earth, and which is which acquire a lustre from the equality and smoothness of their parts, the opposite being the case with those that are ugly and valueless. But when all the moisture is thrown off by the violence of fire, and the body is thus unusually dried up, then is formed the kind of earth that we call clay.

Sometimes also, even without losing its moisture, the earth is fused by the fire, and on cooling becomes a stone of a black colour. In the same manner, when this earth is deprived of the water it holds in mixture, but yet has small particles and is of a saline nature, it forms a half-solid body, still capable of solution in water,—either nitre, which purifies both oil and earth, or else salt, a substance so well adapted to give flavours pleasing to the palate, and deemed by the law as agreeable to the gods. The compounds of these two substances are not soluble by water, but yet can be melted by fire, for the following reasons. Neither fire nor air liquefies masses of earth; because, being naturally composed of elements smaller than the interstices or pores of earth, they easily penetrate through these capacious pores without subjecting it either to dissolution or liquefaction. The parts of water, on the other hand, as they are larger, strive to force a passage, and so dissolve and liquefy the earthy mass:—and hence, when the earth has no strong consistency, water alone will dissolve it, whereas if in a compact state, nothing will affect it but fire, which is the only body that can find an entrance. As for water, again, its strong cohesiveness of parts, when frozen, can be overcome only by fire, whereas, when the cohesion is less strong, it can be equally decomposed by fire and air, the latter entering its interstices and the former separating even its constituent triangles. Nothing, however, can dissolve air strongly condensed, without attacking its composing elements; though when it coheres less strongly, it may be dissolved, though only by fire. Again, in bodies composed of water and earth, while the water occupies all the interstices in its state of compression, the particles of water from without, not finding egress, flow round the entire mass without suffering decomposition; whereas the particles also called soft and yielding, because its bases are less stable than those of earth,—this, when separated from fire and bereft of air, acquires more uniformity, and through their departure *i.e.* of air and fire is compressed into itself;—and when it is thus condensed above the earth, it becomes hail, if on the earth, ice; but when there is less of it and only half the amount of freezing, the water so condensed above the earth becomes snow, and that on the earth, which is formed from dew, is called hoar-frost. When again the numerous kinds of water are mingled together, the entire liquid thus formed, which is filtered from the earth through plants, takes the name of juices or saps. Owing, however, to their mode of admixture, these individual fluids present through their dissimilarity many different undescribed varieties, although four of them, which are of a fiery character, and particularly transparent, have obtained appropriate appellations;—that which heats the soul as well as the body being called wine,—secondly, that which is smooth, and dazzling to the sight, and hence bright, glittering, and apparently of an oily nature, such as pitch, the gum of the kiki-plant, oil, and other things having similar properties;—again, that which possesses a power, as far as nature permits, of diffusing the substances of nutrition over the palate, and by this property presents the idea of sweetness, has obtained the general name of honey;—and lastly, that frothy fluid, which dissolves the flesh by burning, has been distinguished from all the other juices by the name of *opium* ὀπός.

As respects the different kinds of earth, one of them, stone, is produced by the filtration of water in the manner following. The commingled water, when it loses its coherence, passes into the form of air, but, on becoming air, rises to its appropriate place. As, however, there is no vacuum, it presses on the surrounding air; and this, being weighty, and impelled against the mass of earth that it surrounds, violently compresses it, driving it into the vacant spaces whence the new air had before ascended. The earth, also, by the compression of the air into indissoluble union with water, is formed into stones; the more beautiful sorts of fire that enter into the interstices of water, as water into those of earth, and have the same effect on water that fire has on air, alone possess the power of dissolving and liquefying the compound body. And among these, some contain less water than earth; such as all kinds of glass, and such stones as are termed fusible; while others, on the contrary, contain more water, such as wax and aromatic substances.

Having thus then enumerated the several figures and classes of bodies variously formed by admixtures and mutual changes, we must now try to explain the causes of the feelings with which they impress us. First, then, the bodies here spoken of must be always perceptible. As yet, however, we have not discoursed on the generation of flesh, and what belongs to flesh, nor on that part of the soul which is mortal. This nevertheless cannot be suitably explained without at the same time explaining the sensations and impressions produced by external objects; and although one subject cannot be unfolded without a knowledge of the other, yet the two cannot be explained together. We must settle one first, and then proceed to the other. In order, then, in speaking of impressions, to observe the same order as in speaking of the bodies producing them, let our first inquiry be into those that concern the body and soul.

First, then, let us inquire why fire is called *hot*, the reason of which we shall perceive by considering its penetrating and cutting power about our bodies. Now, that this affection is a certain sharpness is nearly evident to all; and as regards the tenuity of its sides, the sharpness of its angles, the smallness of its particles, and the velocity of its motion, through all which it becomes violent, penetrating and capable of instantly dividing whatever it meets; this we should carefully consider, recalling to mind the generation of its figure;—inasmuch as it is this, and no other nature, which separates and parcels out our bodies into small portions, and produces in us that affection which is very properly denominated heat. Now the contrary to this is sufficiently manifest; but still we must not pass it without explanation:—for in truth, among the humid particles surrounding the body, those that have the largest elementary parts enter and drive out the smaller; but being unable to occupy their places, they compress our bodily humours, and from being uneven and in a state of agitation, fix them and render them motionless through their evenness and density;—whereas things brought into contact against nature are naturally opposed and mutually repel each other. From this contest and agitation then there resulted a certain trembling and numbness; and the whole of this affection, as well as the cause that produces it, has the name of cold. Again we call those bodies hard to which our flesh yields; and those soft, which yield to the pressure of our flesh;—thus using the terms comparatively, with reference to each other. Bodies also yield to pressure when placed on a small base, while those resting on quadrangular bases are the least impressible, owing to their very firm position, and because from their own extreme density they strongly resist all opposing pressure.

Again, the nature of heavy and light will become most evident, if investigated with that of up and down;—for it is by no means right to assert that there are naturally two distinct places opposite one to the other;—one termed *down*, to which all bodies tend that are endued with bulk, but the other up, to which bodies ascend contrary to their inclination. The whole universe, indeed, being spherical, all such things as are at the extremities or circumference and equally distant from the centre must all in like manner naturally belong to the extremities, while the centre, being in the same proportion distant from all these extremities, must be said to occupy quite an opposite position. Such then being the nature of the world, would not any one who reversed the position of the above-mentioned objects be fairly thought to apply names to them that are quite unsuitable? For the middle place in it cannot be fairly said to be either naturally down or up, but only the centre itself; and the circumference is neither the middle, nor does it contain within it any parts more distant than the rest either from the centre, or any of the opposite extremities. But when all the parts are naturally so similar, how can any one with propriety assign to them contrary names?—For supposing there were any regular solid body in the centre of the universe, it would never be carried to any of the extremities, owing to their entire uniformity but on the other hand, if any one were to move in a circle round this solid, he would often stand with his feet opposite to where they before were, and so call the same part of himself both the upside and down. Since the universe, therefore, as we have just observed, is of a spherical figure, no prudent man should assert that it has any part which is absolutely either up or down;—yet, as regards the origin and usual application of these terms which we thus transfer to the universe, this we agree to be a proper subject of investigation. If, in that spot of the universe which specially belongs to fire, and where the principal mass is collected with which it has a tendency to unite, any one were to ascend thither and being possessed of the requisite power, were to take up the particles, place them in a balance, and raising the scale, were forcibly to draw the fire towards the air, with which it has no affinity, it is clear that in this case the smaller mass would be more easily impelled than the larger. Indeed, when two things are simultaneously raised by one and the same power, the smaller quantity must of course yield more readily than the greater to the impulsive force by which they are constrained; and hence, the one is called heavy and gravitating downwards, the other light and tending upwards. The same thing also is observable in what we ourselves do, who inhabit this place the earth. For when, in walking on the earth, we separate particles of an earthy nature, and sometimes even portions of the earth itself, forcibly and unnaturally drawing them towards the air which is dissimilar,—then that which is smaller yielding more readily to our impulse is sooner attracted towards the foreign element:—this then we call light and the place towards which it is drawn, up or above, giving to their contraries the terms heavy and down or below respectively. Hence these must mutually differ from each other, owing to the contrary positions that the several elements occupy:—for that which is light in one place is contrary to one corresponding with it in an opposite position, and so also to a heavy body another that is heavy, and to bodies placed above or below ethers, opposed to them in their respective positions;—and they will all be found, whether in a state of becoming or actually existing, to be contrary, transverse, and every way differing from each other. This one thing, moreover, is to be understood concerning all these matters, that the tendency of each towards a body of similar nature gives to the body so attracted the name heavy, and the place to which it tends, down or below; and thus to contrary things are assigned contrary appellations. Such are the causes that we assign to these phenomena. And again, as to the cause of the impression of smoothness and roughness, every one who has investigated it will be able to disclose it to others; for roughness comes from hardness joined with unevenness, while smoothness is the united effect of uniformity and density.

It remains for us now to consider what is most important in those affections common to the whole body, which are the chief causes of pleasure and pain, and to inquire how it is that certain impressions excite through the parts of the body certain sensations invariably attended by pleasure and pain. Thus then let us examine all our impressions, whether sensible or not, calling to mind the distinctions that we before made between bodies moved with ease and those with difficulty;—for this is the way to arrive at the point that we wish to determine. When a body by nature easily moveable has received an impression ever so slight, the several parts communicate it to the parts placed around them, producing on these parts the same effect, until at length they reach the intellect itself, to which they announce the power of the agents producing such impression;—whereas a body, which on the contrary is firm and stable and has no circular motion, is simply affected by itself without moving any of the surrounding bodies; and hence, as their components do not mutually communicate the first received impression, the entire animal remains unmoved, and experiences no sensation. This is the case indeed as respects the bones and hair, and such other parts of the body as are chiefly of an earthy nature; whereas the phenomena above described principally refer to the organs of sight and hearing, which contain an abundance of fire and air. This is what we should hold then concerning pleasure and pain:—an impression produced in us contrary to nature, and with violence, causes pain,—one that is conformable to our nature, however strong, pleasure;—whereas an impression that is gentle and gradual is unperceived, while the contrary to these produces contrary effects. An impression, again, the whole of which is easily produced, is pre-eminently an object of sensation, but is not affected by pleasure and pain:—and of this kind are the affections belonging to the sight; which indeed, as we have above asserted, is a body of a nature daily becoming allied to ourselves. For in this way the impressions caused by cuttings and burnings, and other similar accidents, do not cause pain to the sight; nor again, does it experience pleasure, from returning to its previous condition:—whereas the sensations that are strongest and most clear do this, so far as any one is affected by any object; and this is the reason why there is no violence whatever either in its expansion or contraction. But bodies composed from larger parts, which yield with difficulty to impelling agents, and distribute their motion over the whole body, do experience pleasure and pain; pain indeed, when they are often alienated from their own nature, but pleasure when restored to their former condition. Again, all bodies that admit of very gradual withdrawals, and, as it were, emptyings of their own nature, and at the same time receive supplies on a large scale, have no perception of loss, though they have of what accrues to them; and hence, they do not give pain to the mortal part of the soul, but on the contrary the greatest delight:—and the truth of this is manifest from the sensation of pleasant odours. But such bodies, on the other hand, as suffer excessive variation, and can scarcely be restored even gradually to their pristine condition, are affected in a manner quite the reverse of those we have just described; the truth of which is manifest in the case of burnings and wounds inflicted on the body.

Having thus then pretty fully discussed the common affections of the whole body, and the appellations assigned to their effective causes, we must now endeavor to explain, as far as we can, the affections that arise in particular parts of us, as well as the causes by which they are induced. In the first place then, let us if possible complete the explanation of what we before left unfinished about those of the juices,—namely, the particular affections subsisting about the tongue. And these, as well as most others, appear to be produced by certain expansions and contractions, the impressions formed thereby depending more on smoothness and roughness than all other circumstances; because, whenever anything falls on the small veins round the tongue which are the arbiters, as it were, of the taste stretching to the heart, in such a way as to penetrate the moist and delicate texture of the flesh, which through its earthy nature is in a melting state, it contracts and dries up the veins:—and where these penetrating substances are rougher than usual, they have an acrid taste στρυφνά, if less so, only one of sourness αὐστηρά. Those on the contrary which purge, and wash away whatever adheres to the tongue, if they do this to such an immoderate degree, as somewhat to liquefy its nature, as nitre does;—all such as these are termed bitter; while substances of inferior power to nitre, which purge only moderately, we conceive to be salt, without that rough bitterness, and to be more friendly to our nature. Again, things heated by the temperature of the mouth, and thereby softened—which reciprocally heat and are heated by it—and which through their lightness are elevated towards the senses of the head, dividing at the same time whatever comes in their way;—all these, owing to such properties, are termed pungent δριμέα. But when these same particles, thinned by putrefaction, enter into the narrow veins, and there come into contact with earthy and airy particles of a suitable size, and by making them mutually revolve, so mix them together as to cause a confusion of their elements, and thus by entering other veins form interstices in which the liquid, sometimes earthy, sometimes quite pure, forms, as it were, certain air-cavities enclosed by water, some of which formed of pure liquid are transparent, and called bubbles, while those composed of earthy liquid and in a state of agitation have received the name of seething or boiling, and yeast or leven;—the effective cause of all this being termed acid ὀξύ. And an affection contrary to all that has been asserted about these, proceeds from a contrary cause; for, when the liquid compounds that enter the mouth are naturally suited to the quality of the tongue, they lubricate its asperities, as well as contract or relax such parts as were before unnaturally dilated or compressed, and restore them, as far as possible, to their proper and natural habit. Hence all such substances are pleasant and friendly to every one, become the remedies of violent passions, and are denominated *sweet*. And thus much may suffice concerning particulars of this kind.

As respects the faculty of the nostrils, it admits of no classification: for all odours whatever are but half-begotten,—there being no substances so proportioned, as to give forth any particular smell. Besides, our veins surrounding the nose are too narrow to admit the various kinds of earth and water, and too broad for those of fire and air; and hence no one ever perceives an odour from any of these,—odours being produced from bodies that are damp, putrefying, liquid, or vaporous;—for odours are generated by the change of water into air, or air into water; and all these are either smoke or vapour. And of these, that which passes from air into water is vapour,—that which is changed from water into air, smoke;—whence it comes to pass that all odours are more subtile than water, and denser than air. And these facts are clearly shown, when any one, owing to any obstruction of the respiration, draws his breath inwards; for then no odour filters through, but breath only—unattended by any odours. This is why these two varieties of them are without a name, being formed neither from many nor from a simple species, the only two distinct terms respecting them, being pleasant or unpleasant; the latter of which irritate and violently disturb the whole cavity lying between the top of the head and the navel, while the former soothe the same part, and kindly restore it to its natural condition.

Let us next speak of and investigate the third kind of sense,—the hearing, and the causes giving rise to the affections peculiar thereto. Now we may generally define voice as a certain pulsation of the air, penetrating through the ears, brain, and blood, as far as the soul; and the motion hence arising, which commences from the head and ends in the seat of the liver, *hearing*;—and that when this motion is swift, it emits a sharp sound, when slow, a flat one,—-the former being uniform and smooth, the latter quite the reverse and rough:—likewise, that when the motion is on a large scale it will produce a loud sound, and when on a small scale only a low one. But respecting the harmony of these sounds we must speak in the subsequent part of this discourse.

The fourth kind of sense, which is still left for us to discuss, comprises a very large variety of what we generally term colours, which consist of a flame emanating from individual bodies, and having parts proportioned to the sight for producing sensation. But we have already considered the effective causes of sight. Here then we ought to speak of colours, and what seems to us the most probable theory respecting them.

Among the particles that fall from other bodies on the sight, some are greater, others less than, and others equal to, those of the visual fire. Such as are equal, then, are imperceptible, and are termed transparent; while, as for those that are larger or smaller, the former contract, the latter dilate the sight, having a power resembling that of heat and cold on the flesh, or of things acrid, heating and pungent, on the tongue. Particles affecting the sight in this manner are called black and white;—having the property, indeed, of producing the same modifications in bodies, though, being produced in different parts of the organ, they still appear to produce different impressions. It is thus, then, that we ought to term them,—white, that which dilates the sight; and that which is opposite in its effect, black;—whereas, when a sharper motion, and that, too, from a foreign fire, falls on and divides the sight even as far as the eyes themselves, and both separates and moistens the openings of the eyes, so as to force from them that united flow of fire and water that we call tears, and which are of a fiery nature coming from without,—these two fires meeting together with a force like that of lightning, and then saturated and extinguished by moisture, produce a great variety of colours, the impressions from which we term *flashings* μαρμαρυγάς, and the objects producing them *bright* and *lustrous*. Another kind of fire, intermediate between those just mentioned, and which reaches the moisture of the eyes, and mingles with it, though by no means lustrous, and in which the rays of fire are mingled with moisture, and form a bloody colour; this we denominate red. A bright hue mingled with red and white forms the colour called yellow; but as regards the measure in which they mingle respectively, even a wise and thinking person could not explain it, were he ever so well informed on the matter, as he could not adduce concerning them any satisfactory reason, either necessary or probable. Again, red, when mingled with black and white, produces a purple colour; and a very deep colour is the result of their being mingled and burnt together, with a further addition of black. A *tawny red* is produced from the mixture of yellow and brown, and brown from the mixture of black and white; and a pale colour from the mingling of white and yellow. A brilliant white, falling on a large quantity of black, constitutes a *dark blue* κυανοῦν; a deep blue mingled with white, a *grey* colour; and a tawny red mingled with black forms a *green*. All the other tints it will be easy to conjecture from the above examples, if one only reasons fairly from analogy. Nevertheless, any one who would prove them by the test of experiment evinces great ignorance of the difference between a divine and human nature; for a god indeed may be able to mingle many things into one, and again dissolve the one into many, through his united power and intelligence; but no man living can accomplish either of these tasks, nor will any one in time to come.

All these things which thus naturally subsist from necessity, the artificer of what is most beautiful and best took for his elements of creation, in producing a self-sufficient and most perfect god; employing secondary causes indeed, but at the same time performing his work well on all created beings. For this reason we must distinguish two species of causes; the one necessary, the other divine. And in all things we should inquire after the divine cause, with the view of obtaining a blessed life in the highest degree of which our nature admits, for the sake of which also we should investigate the necessary cause as well,—convinced, that without these two classes of causes, we can neither understand nor apprehend, nor otherwise engage in the several objects of our anxious pursuit. Since, then, we have now before us the various classes of causes, laid out like materials for our labour, and which will serve as the matter from which we are to interweave the remainder of our discourse, let us again briefly recur to our first observations, and thence pass rapidly on to the place at which we are now arrived; thus endeavoring to annex such an end and close to our discourse, as may harmonize with its beginning.

Just as we stated in the opening of our discourse,—when all sensible things were in disorder, the Deity made each individually to harmonize with itself and mutually with all the rest, so far as things could possibly be brought into symmetry and proportion; because formerly, nothing had any order except by accident, nor did anything whatever deserve the names that things receive at present; such, for instance, as fire, water, and the rest of the elements. All these, however, the Creator put in order first of all, and then out of these constructed the universe, as a single animal, containing within itself different kinds of animals, mortal and immortal,—he himself being the artificer of Divine natures, but committing to his offspring the junior gods the charge of producing those that are mortal. The latter, in imitation of their father, receiving the immortal principle of the soul, next fashioned the mortal body, making it entirely to be a vehicle thereto, and forming within it a separate mortal kind of soul, possessed of certain dire and necessary passions: first, pleasure, the chief lure to evil; next, pain, the desertion of what is good;—after these again, temerity and fear, both mad advisers; anger, hard to be appeased; hope, which is easily misled both by irrational sense, and all-daring love. By mingling these together, they the junior gods necessarily composed the mortal race. And on this account, fearing to defile the Divine nature more than was absolutely necessary they lodged man’s mortal portion separately from the Divine, in a different receptacle of the body; forming the head and breast, and placing the neck between, as an isthmus and limit to separate the two extremes. In the breast, indeed, and what is called the thorax or trunk, they seated the mortal part of the soul. And as one part of it was naturally better, and another worse, they formed the cavity of the thorax into two divisions resembling the separate dwellings of our men and women, placing the midriff as a partition between them. That part of the soul, therefore, which partakes of fortitude and spirit, and loves contention, they seated nearer the head, between the midriff and the neck; as it is the business of the reason to unite with it in forcibly repressing the desires, whenever they will not obey the mandate and word issuing from the citadel above.

The heart, which is the head and principle of the veins, as well as the fountain of the blood that impetuously circulates through all the members, they placed in a kind of sentry-house, that, in case of any outburst of anger, being informed by the reason of any evil committed in its members, owing either to some foreign cause, or else internal passions, it the heart might transmit through all its channels the threatenings and exhortations of reason, so as once more to reduce the body to perfect obedience, and so permit what is the best within us to maintain supreme command.

But as the gods foreknew, with respect to the palpitation of the heart under the dread of danger and the excitements of passion, that all such swellings of the inflamed spirit would be produced by fire, they formed the lungs to be a sort of protection thereto; first, of all, soft and bloodless, and next, internally provided with cavities perforated like a sponge, in order to cool the breath which they receive, and give the heart easy respiration and repose in its excessive heat. On this account then, they led the channels of the windpipe into the lungs, which they placed like a soft cushion round the heart, in order that when anger rises in it to an extreme height, it might fall on some yielding substance, and so getting cool, yield cheerfully and with less trouble to the authority of reason.

That part of the soul next, which has a desire for meats, drinks, and all else that is necessary for the natural supplies of the body, they placed between the midriff and the region of the navel; forming, as it were, in all this place a sort of manger for the nutriment of the body; and then they bound it on to it, like some savage animal, annexed as necessary to nourish the mortal race afterwards to be brought into existence. This place of course the gods assigned it, in order that ever feeding at its manger, and dwelling as far off as possible from the deliberative part of the soul, it might make the least possible degree of tumult and noise, and permit the best portion of our nature to consult in quiet for the common benefit of the whole. Knowing also that this part would not acquiesce with the reason, and, even if it had any faculty of sense, yet would not regard the processes of reasoning, but be chiefly lured away, both day and night, by images and phantasms,—reflecting on this, the Deity formed the liver, assigning it the place it occupies. And he made it compact and smooth, shiny and sweet, and yet somewhat bitter,—in order that the multitude of thoughts falling on it from the intellect as on a mirror that receives and presents images to the view, might on the one side terrify it by employing a bitterness akin to its nature; and proceeding to dreadful threats, gradually mingle this bitterness with the whole liver so as to present the dark hues of bile, and by contracting it, render it throughout rough and wrinkled;—or on the other, partly by removing the liver from its right place and contracting it, partly by obstructing and closing its ventricles and gates, cause impressions of pain and disgust:—whereas, on the contrary, when a gentle inspiration—the result of intelligence—depicts on it images of quite an opposite character, softens its bitterness by avoiding to agitate or touch anything contrary to its own nature,—it then gives it a softness peculiarly its own, and makes all its parts regular, polished, and free,—giving joy and peace to that part of the soul which resides near the liver, and making it enjoy a suitable repose at night, with the power of divination during sleep, to make up for its want both of reason and wisdom.

Those, forsooth, who created us, calling to mind their father's command, when he bid them make the mortal race as good as they possibly could, formed even the inferior part of us to have some connexion with truth, by establishing within it the faculty of divination. And a sufficiently clear proof, that the Deity assigned prophetic power to human madness, is found in the fact that no one in his right senses has any concern with divinely inspired and true prophecy, which takes place only when the reasoning faculty is fettered by sleep, or alienated by disease or enthusiasm; while, on the other hand, it requires a person of considerable wisdom to understand the recorded sayings, whether sleeping or waking, of a prophetic and divinely-inspired nature, and so to distinguish all the phenomena it beholds as to be able to explain in what way and to whom they portend any future, past, or present good or evil; it being by no means the office of one who either has been, or is still mad, to judge respecting things seen or spoken by himself:—and it has been well observed by the ancients, that to transact and know one's own concerns and oneself is alone the province of a prudent man;—whence, indeed, the law directs that the race of prophets or interpreters should preside as judges over divine predictions,—whom some indeed call diviners, through entire ignorance that they are only the representers of enigmas and visions, and not at all entitled to be called diviners,—being, strictly speaking, interpreters of prophecies.

The liver then was constructed for this purpose, and seated where we have mentioned, for the sake of prediction. And besides, in every living individual, this organ gives forth unusually clear indications; but in those deprived of life, it becomes blind and delivers oracles too obscure for their meaning to be made intelligible. The nature and position of the intestines, again, which is next to it the liver, is on the left side, for the purpose of always, like a sponge, keeping it clean and bright, ready to reflect images; on which account, therefore, when certain impurities are produced in the liver by bodily disease, then the spleen, by its rarity, receives and purifies them all, from being of a hollow and bloodless texture;—and hence, is it, that when filled with unclean matter, it grows to a large size and becomes wholly unsound. And again, when the body is purified, it subsides into its natural condition, as before.

As respects the soul, then, including both its mortal and divine portion, in what way it existed, and in what way and why it was consigned to a separate habitation, the truth can be firmly established only by the consent of the Deity:—still, that we have stated what is near the truth, we will now, quite open to investigation, venture the assertion; and here accordingly it is made. And what next follows we must treat in a similar manner; and this is no other, than how the rest of the body was produced. It is, therefore, in the most eminent degree becoming that they should be composed as follows:—Those who formed our race were aware, that we should be intemperate in eating and drinking, and that through madness we should use far more than is either necessary or moderate. For fear then of rapid destruction induced by disease, and lest our mortal race should perish without fulfilling its end,—to provide against this, the gods formed for the reception of the superfluous food a receptacle beneath, called a belly, and formed in it the convolutions of the intestines to prevent the food from passing so quickly as to require fresh and rapid supplies of nutriment for the body, and so by insatiable gluttony making our whole race unphilosophical and unmusical, insubordinate to the most godlike part of our composition.

The nature of the bones and flesh, and other parts of this kind, was constituted as follows:—The first principle of all these is the generation of the marrow; for the life-bonds of the soul that united it with the body being herein woven together, constitute the foundation of the mortal race. The marrow itself, however, has a different origin; for among the triangles, those of the first order, that are unbent and smooth, were specially adapted by their accuracy for producing fire and water, air and earth:—these the Deity, separating each apart from its own class, and mingling them together in fixed proportions, composed by these means an all-varying mixture of seeds for the whole mortal race, and from these produced the marrow;—and he afterwards implanted this marrow, binding therein the various classes of souls; and as respects the number of figures and what individual forms the marrow was to receive, he divided it, both as regards the quality and quantity of the particles, at the original distribution,—giving to that part of it which was to be the field for containing the divine seed a completely globular shape; and this he called the *brain*, because in every animal that has arrived at its perfect form, the vessel containing this substance is called the *head*. But as respects the part destined to contain the remaining and mortal part of the soul, to this he gave both round and oblong shapes, giving to the whole the name of *marrow*; and from these, as from anchors, casting the bonds of the entire soul, he built around it our whole body, after first fixing round it a complete covering of bones.

The bones he composed as follows:—Having sifted pure and smooth earth, he mingled and moistened it with marrow; and after this he placed it in fire, then plunged it in water, once more placed it in fire, and after this dipped it in water: and thus by frequent transfers of each, he made it insoluble by either. With this bone, then, he fashioned a sphere, as on a lathe, placing it round the brain, and only leaving a narrow hole therein. At the same time also he formed of the same substance certain vertebrae about the marrow of the neck and back, extending them like hinges, from the head downwards through the whole trunk;—and thus he preserved all its seed, by fortifying it round with a stony covering,—forming in it joints also, for motion and flexion, employing the power of difference in their formation, as being possessed of a certain middle quality. Then, considering that the bone would have a tendency to become dry and inflexible, and that when heated and again cooled, it would become carious, and quickly corrupt the seed it contained, he on this account formed the sinews and flesh; that the former, by binding all the parts of the body, and being stretched and loosened about the vertebrae, might give the body a facility for either flexion or extension, as occasion required; while the flesh would serve as a covering from the heat and defence from the cold;—as likewise for a protection against falls, in the same manner as cushions do it, by gently and easily yielding to external bodies: and he implanted in it also a hot moisture, which perspires in summer, and gives forth an external dew, to impart a coolness to the whole body,—and again in winter, gently keeps out by its own fire the cold brought from without.

Our plastic Creator, reflecting on all this then, mingled and united water, fire, and earth, gradually mixing therewith a ferment of acid and salt;—and thus he composed a pulpy, soft flesh:—And as for the tendons, he formed them of a mixture of bone and unfermented flesh, so as to have the properties of both, tinging them also with a yellow colour. And on this account is it, that the tendons are firmer and more viscous than the flesh, but softer and moister than the bones. With these God bound together the bones and marrow, afterwards enshrouding the whole of them with the covering of the flesh. Such of the bones, then, as were most ensouled, he covered with the smallest quantity of flesh,—such as were least so, with the most and the densest flesh. And besides this, except where reason evinced the need of the contrary, he placed only a small quantity of flesh on the joints of the bones; lest they should make the body uneasy by impeding its flexions and motion; or else, from being many and frequent, and strongly pressed together, cause by their solidity a dulness of perception, imperfection of memory, and a sort of intellectual blindness. On this account then, the bones of the groin, legs, loins, the shoulders and the arms from the elbow to the wrist, and such other parts of our bodies as have no joints, and such inward bones as have no thought, owing to the scarcity of soul in the marrow, are fully provided with flesh;—whereas those that have thought, he covered with less, except the flesh were for perception, as in the case of the tongue. In other respects, the case is as we have described. For a being born and nurtured under necessity, does not receive a hard bone united with plenty of flesh, and with it also a quickness of sensation. And yet the head would have been thus constructed, if the two had exercised any will in thus coalescing; and the human race, having a fleshy, tendinous, and robust head, would enjoy healthy and unmolested a life twice as long as the present, or even yet longer than that: but the artificers of our race, after thoroughly considering whether they had better make it more lasting and of worse condition, or shorter but of a more excellent character, were agreed that a shorter but better life was wholly preferable to one longer, but inferior:—and this was why they covered the head with a thin bone, and not with flesh and fibre,—because it had no joints. On all these accounts, then, the body was provided with a head, which was the more perceptive and reflecting, in proportion as it was physically weaker than all the rest of man's structure. From these causes, then, and in this manner, the Deity placing tendons round the lower extremity of the head, glued them, as it were, round the neck, and bound with them the lofty cheek-bones placed under the forehead;—and as for all the rest, he scattered them through all the members, connecting joint with joint.

We were next provided by those who formed us with the organs of the mouth, teeth, tongue, and lips,—arranged as they now are for purposes both necessary and the best; giving ingress for necessaries, and egress to what is best,—everything, indeed, that enters to feed the body being necessary—while the stream of words flowing outwards, if guided by wisdom, is by far the fairest and best of all streams whatever.

Again, it was not possible that the head could bear a mere covering of thin bone, owing to the extremes of the different seasons; nor again, could it be allowed to become clouded, blind, and unperceptive, through the overcrowding of flesh. Hence a fleshy membrane, not dried, was left separate from the rest,—that now termed cuticle or scalp. This, then, being brought into union with itself by the moisture about the brain, grows around and circularly invests the head. And it is the moisture flowing under the sutures that moistens this membrane, and causes it to close at the crown, connecting it as in a knot. But as for the ever-varying classes of sutures, these are generated through the power of the periodic changes caused by nutriment in the flesh; the variety becoming greater, when they struggle with each other more violently—less so, when less violently. All this membrane the Divine Being pierced all round with fire:—and hence, as it was wounded, and the moisture externally flowed through it, all that was pure of the moisture and heat was carried off, while that which was mixed, and of a nature allied to that of the membrane itself, being raised by the motion, was stretched outwards to a great size, having also a tenuity equal to the amount of puncture,—whereas, on the other hand, when continually thrust back through the slowness of its motion by the spirit surrounding it externally, it again revolves under the membrane and there becomes firmly rooted. And owing to these affections is it, that the hair springs up on the membrane of the head, being naturally allied, and serving as a rein to this membrane, but at the same time becoming harder and denser through the pressure of the cold, which hardens each hair, as it proceeds beyond the skin. Thus, then, by the means above mentioned, did our Creator plant the head with hairs, reflecting at the same time that instead of flesh a light covering was needed to guard the brain, and give it shade and protection from the extremes of heat and cold without hindering its acuteness of sensation.

But the mass of tendon, skin, and bone that is interwoven about the fingers, being a mixture of three substances, becomes, when dried, one common hard membrane composed of all in common—fashioned indeed with these as instrumental causes, but effectively produced by that reflection which ever has an eye to the future:—for those who formed us well knew, that women and other animals would some day be generated from men, and that nails would be of the greatest use in several respects to many of the animals:—and this was the reason, why they stamped in men the pattern of the nails at their first birth. It was from these causes, then, and with these intentions, that they implanted skin, hairs, and nails at the extremities of the limbs.

As the parts and members of the mortal animal however were all allied in nature, and their life necessarily resulted from fire and spirit, the decay and exhaustion of which would cause it to perish quickly, the gods provided for it the following remedy:—Intermingling a nature resembling that of man with other forms and senses, they planted as it were other animals,—such as kindly-disposed trees, plants, and seeds, which are made useful to us by the nurture and training of agriculture; though before there were only those of a rustic kind, which are more ancient than those that are cultivated. Everything indeed that partakes of life we may justly and most correctly call an animal;—but that in particular, of which we are now speaking, is possessed of the third species of soul, which we place between the midriff and the navel: and which has no share either in opinion, reason, or intellect, though possessing a sense of pleasure and pain, as well as desire. It effects all things indeed by passion or appetite; and it does this by the evolution of its internal power and the employment of its own motion to the exclusion of every other, as it has not been formed with a nature capable of reasoning on its own concerns. It thus lives in no way different from an animal, except in being firmly rooted in a fixed position and deprived of original motion.

Now after the directing artificers of our structure had implanted all these organs for giving nutriment to our inferior nature, they directed various channels through our body, so as to water it like a garden, by the constant accession of flowing moisture. And first, they cut two hidden channels beneath the juncture of the skin and flesh, viz. two veins going down the back to correspond with the double figure of the body, both on the right and left sides. These they placed close to the back-bone, so as to receive between them the marrow, the growth of which might be thus promoted, and that the flood supplied thence to other parts, might give an equable irrigation;—and then, dividing the veins about the head, and mutually interweaving them, they distributed them in opposite directions,—inclining some from the right to the left of the body, and some from the left to the right, that there might be a chain formed by the skin to unite the head to the body, there being no interlacing of tendons round the head,—and besides this, that the affection of sensation might from each of these parts pass round and through the body. It was in some such way as this, then, that they prepared the channel, of which we speak; and its truth we shall easily perceive by assenting to our previous position,—that all things composed of greater parts may envelop such as are less, while those consisting of less cannot envelop the greater. But fire is, of all classes of things, composed of the smallest parts; and hence it penetrates through water, earth, and air, and their several compounds,—and this to such an extent that nothing can retain it. The same remark is true of our belly, which is able to retain any food that has been introduced, but cannot hold spirit and fire, because they consist of smaller particles than those composing the belly.

These channels therefore the Deity employed for the purpose of distributing moisture from the belly into the veins, by weaving with fire and air a network resembling basket-nets or weeds, with two curved passages of entrance,—one of which he again twisted and divided into two branches, winding the continuations of these curved passages like coils of rope in every direction as far as the ends of the net. Now all the inner parts of the network he composed of fire, but the great flexures and the receptacle itself of air;—and lastly, he took and placed them in the new-formed animal, as follows. One of the curved passages he placed in the mouth; but, as this part has two flexures, he caused one *i.e.* the trachea to pass along the arteries into the lungs, the other *i.e.*. the œsophagus by the side of the arteries into the belly. The other curved part he divided into two separate passages, making them pass in common to the channels of the nose, so that when the one does not reach the mouth, all the streams of the other might still be filled from this. But as for the remaining part of the hollow network, he made it extend all over the concavity of the body, and the whole of it flow gently together into the curved passages, as being of an airy texture, and at another time to flow through them backwards. But the net, which is of a thin structure, he so disposed as to make it penetrate through and again emerge. Besides this, he ordered that the interior rays of fire should follow in constant succession, the air at the same time passing into each, and that this should never cease to be the case, as long as the mortal animal’s life continued. And as respects the name of this hind of motion, we call it expiration and inspiration. Now this whole action and affection that it produces in our nature, is caused by certain bodily moistenings and coolings, alike conducive to our nutriment and life:—for as the breath passes in and out, an interior fire attends it in its course; and when it is diffused through the belly and meets with solid and liquid food, it reduces them both to a state of moisture, and by dividing them into very small parts, carries them along in its course; pouring them, as from a fountain, into the veins, and so cutting channels through the body as through an aqueduct.

But again let us consider the affection of breathing, and investigate the causes which gave it its present nature. We should reason on it, therefore, as follows—As there is no such thing in nature as a vacuum into which a moving body can enter, and as breath passes from us outwards, every one is aware that it cannot escape into void space, but must thrust out whatever is nearest; again, that the body must always repel that ever nearest, and that from a necessity of this kind, everything impelled into the place vacated by the emitted breath must, after entering and filling up this space, attend on the breath as it travels. And all this must take place like the revolution of a wheel, through the impossibility of a vacuum. Hence, the breast and lungs, after dismissing the breath outwards, are again inflated by the entrance of the air surrounding the body into and around the cavities of the flesh. And when the air is again sent outwards and flows round the body, it drives the breath inwards through the mouth and nostrils.

And as regards the cause from which they derive their origin, we may propose the following. In every animal in the universe those of its internal parts are the hottest which surround the veins and blood, just as if they contained a fountain of fire; and this heat we compared to a bow-net, extending through the middle of the body, and woven wholly of fire; all outside of it being composed of air. Yet heat, it must be agreed, naturally proceeds outward into a region with which it is allied. But as there are two passages for the heat,—one through the body outwards, the other again through the mouth and nostrils; hence, when the breath is impelled towards the latter, it in turn repels that latter. But that which is drawn into the fire becomes heated by so falling, while what is exhaled becomes cooled;—and so, owing to the change of temperature, they pass again into their former condition, whether hot or cold, through the mutual repulsion of each other; and as the same influence is constant and mutually operating, its circular agitation gives birth to the expiration and inspiration of the breath.

To the same causes may we ascribe the impressions produced by medical cupping-glasses, by swallowing drink, by the violent hurlings of bodies, whether upwards or on the ground, together with such sounds as appear swift or slow, sharp or flat,—and which at one time are discordant, owing to the dissimilitude of the motion which they cause within us, and at another harmonize, through the similitude of that motion. For the slower sounds catch up those antecedent and swifter, because the latter slacken their pace to one like their own; and by so following the swifter, they still urge them onward,—though without disturbing the motion by introducing another, but making their slower rate to approach gradually to that of the swifter;—and this mixed impression from the sharp and flat *i.e.* the quick and slow forms a single note; whence results the pleasure felt even by the unwise, but really entertained by the wise, which is owing to the imitation of Divine harmony that exists in mortal motions. And, indeed, with respect to all the motions of water, the fallings of thunder, and the wonderful circumstances observed in the attraction of amber, and the Herculean stone,—in all these, no real attraction takes place at all; but as a vacuum can nowhere be found, the particles are mutually impelled by each other; hence, as they all individually, both in a separate and mingled state, have an attraction for their own proper seats, it is by the mutual intermingling of these affections, that such admirable effects present themselves to the view of the accurate investigator.

It is specially owing to this cause, that respiration whence our discourse originated is generated; and after the manner that we have before shown;—namely, that as fire divides the food and rises internally to attend on the breath, the veins from the belly become filled by this joint elevation, in consequence of drawing thence the divided portions of the food; so that by these means, through every animal body the streams of nutriment are abundantly diffused. But the parts which are recently cut apart and separated from their kindred natures,—some of them fruits and others grasses, and produced by the Deity for bodily food, acquire varieties of colour through their mutual admixture; though for the most part the red predominates, as its nature consists of fire combined with a lump of moist mud. Hence also the colour of that which flows about the body is just what it seems, and is also called *blood*, being the nurturing principle of the flesh and whole body; and so by everywhere diffusing its moisture, it copiously replenishes all the exhausted parts.

As for the manner of impletion and depletion, it is produced in the same way as the change of everything in the universe; viz. from the circumstance of all kindred natures having a common attraction:—for the natures with which we are clothed externally, are perpetually melting and being distributed, each form of matter departing to that with which it is allied. But the particles of blood which are contained in, and distributed throughout our bodies, as is the case with every animal created under heaven, necessarily imitate the motion of the universe. Each, therefore, of the divided parts within us, being borne along to its kindred nature, again replenishes what is void. But when the decretions exceed the accessions, the whole animal falls into decay; but in the contrary case, it acquires growth.

The new composition therefore of every animal, as it has new triangles, *i.e.* elementary principles, formed as it were from fresh timbers, causes them to lock closely within each other,—the whole of its bulk being of a delicate structure, formed of fresh marrow and fed on milk. Those triangles, therefore, that compose the bodily aliment, having entered it from without and been received into the animal, from being older and weaker than the simple original triangles therewith agreeing, are overpowered and destroyed by the new triangles; and the animal grows to a large size, because it is supplied from a multitude of similar parts. But when the root of these triangles is relaxed by fatigue and dulness, brought on by the repulsion of many particles during a long period of time, then the food received can no longer cut into its own similitude; but they are themselves easily separated by the bodies that enter from without. Overcome by this, the whole animal at length decays; and this state is what we call old age:—and at last, when the jointed chains of the triangles about the marrow can no longer hold, but through long employment get unfastened and set free the bonds of the soul,—the soul thus loosened naturally flies off with pleasure and delight; for everything contrary to nature is painful, while the natural is pleasant. Hence the death caused by wounds and disease is painful and violent,—while that which follows old age, as the end agreeable to nature, is of all deaths the least irksome, and attended rather by pleasure than pain.

As to the origin of diseases, that must be obvious to every one:—for as there are four component elements of the body, viz. earth, fire, water, and air, the unnatural overabundance or defect of these, and their removal from their own to a different position,—those of fire, we mean, and the other classes, for there are more than one,—these are the causes why they do not each receive what suits their peculiar nature, and they necessarily produce disturbances and diseases: for as these are severally generated and transferred in a way contrary to nature, such things as were formerly heated become cold, what were once dry moist, the light heavy—all things, in short, undergo all possible mutations. For we assert that it is only when the same thing approaches to and departs from the same in the same manner and according to analogy, that it will allow what is the same with itself to abide in health and safety: and should any of them be in discordance, whether approaching or departing, it will cause all varieties of alienations, as well as unnumbered diseases and corruptions. But having now found the second set of conditions suitable to nature, the second mode of considering diseases also is now open to any one desirous of so doing. For as the marrow, bone, flesh, and sinew are composed of those elements, as likewise the blood in another way, though from a similar origin, so also most other diseases owe their severity to the causes we have mentioned; though the greatest of them are to be traced to the following cause:—When the generation of these various bodily substances takes place inversely, then they become subject to corruption:—for the flesh and sinews are naturally formed from blood,—the sinews indeed from fibres, through the connexion between these, but the flesh from its union with that which when in a separate state becomes solid:—while the glutinous and fatty substance again which is formed from sinews and flesh, at once unites the flesh to the bone, and itself feeds the growth of the bone itself, with which the marrow is surrounded. And again, that which filters through the solid part of the bones, being the purest kind of the triangles, as well as most smooth and unctuous, moistens the marrow by falling drop by drop from the bones.

When these several things are the case, health mostly ensues; but when the contrary happens—disease. For when the flesh becomes liquefied and sends back what it loses into the veins, then the blood mingled with spirit flows abundantly, and of all kinds, through the veins, with different degrees of colours and bitterness; and yet further, from its acid and salt qualities, it generates all kinds of bile, lymph, and phlegm;—for as they are all generated and corrupted in an opposite way, they first of all destroy the blood itself; and the fluids that can no longer afford nutriment to the body, are borne along the veins without any natural order of circulation; at variance, indeed, with each other, because they derive no mutual advantages from the properties of each, but positively hostile to the constitution of the body, and its maintenance in health,—in short, destroying it and bringing it to putrefaction.

Such, therefore, of the flesh as becomes liquefied by its great age, being indisposed to putrefy, grows black from long burning; and from having been entirely macerated it becomes bitter, and falls into discontent with the other parts of the body not yet infected with corruption. And then, indeed, instead of bitterness, the black part assumes an acidity, if the bitter becomes more attenuated: but when the bitterness is tinged with blood, it becomes still redder; and when mixed with black, it assumes the nature of bile:—and yet further, to the bitterness is added a yellow colour through the melting of new flesh on the fire surrounding the flame. And this common name for all these some of the physicians assigned them,—or at any rate some who were able to consider many things dissimilar, and to detect in a single class a great number of particulars all deserving a special name. But all else that may be called kinds of bile, receive, according to colour, a name peculiar to each. As for *lymph* ἴχωρ the whey of the blood, it is gentle and mild: while the sediment of black, acid bile, is fierce and wild;—and when mingled by heat with anything of a saline quality, it is called acid *phlegm*. Again, the moisture running from new and tender flesh mingled with the air, which is afterwards inflated and enclosed by moisture, produces bubbles, which separately are invisible, owing to their small size, but when collected in a large bulk become visible, and acquire a white colour from the generation of froth. And all this liquefaction of delicate flesh, when woven together with spirit, we term white phlegm,—the sediment of recent phlegm, *tears* and *sweat*; together with all such secretions that the body sends forth for its purification.

All these indeed become the instruments of disease, when the blood is not supplied naturally from liquid and solid food, but gains bulk from contraries in violation of the laws of nature., When any part of the flesh therefore becomes separated by disease, letting its first principles remain, half the trouble is removed; for it admits of an easy recovery. But when that which binds the flesh to the bones becomes diseased, and the blood flowing from the fibres and sinews no longer serves as food to the bones and a bond to the flesh, but, instead of being fat, smooth and glutinous, becomes rough and salt from being parched by bad diet; then, in consequence of suffering all this and being separated from the bones, it is itself crumbled down under the flesh and sinews;—while the flesh falling at the same time from its roots, leaves the sinews bare and saturated with salt; and thus, entering once more the circulation of the blood, it increases the number of the aforesaid maladies. And if these bodily ailments be severe, still more afflicting and troublesome are those that precede them; when the bone, owing to the density of the flesh, does not allow sufficient respiration, but becoming heated through rottenness, falls into decay, and will receive no nutriment, but on the contrary gradually crumble away,—bone falling on flesh, and flesh again on blood, diseases being by these means produced that are of a severer character than the former. By far the worst of all maladies however is,—when the marrow becomes diseased through some defect or excess;—because it is then productive of the most vehement and fatal diseases, the whole nature of the body being necessarily reversed and destroyed.

Again, as to the third species of diseases, we ought to consider them as divided into three classes,—one produced by spirit, a second by phlegm, and a third by bile. For when the lungs, the great guardian of the breath, through being obstructed by defluxions, will not allow a free passage to the breath, which thus has no egress one way, and in another enters in larger supplies than it ought, those parts which are not cooled by it become putrid, while those that receive too much of it, passing violently through the veins, distort them and become liquefied, being shut out with the diaphragm in the middle of the body: and thus ten thousand severe ailments hence arise, together with an abundance of sweat. And frequently, when the flesh becomes separated within the body, breath is produced, which not finding escape externally, causes the same torments as the breath entering from without. The greatest pains that it produces, however, are, when it surrounds and swells out the sinews and neighbouring veins, stretching and distorting the tendons and sinews continued from the back. Now these diseases, from their disposition to extension, are termed tensions and contortions from behind,—the cure of which it is difficult to find; because fevers supervene and generally bring them to a close. But the white phlegm, when it becomes troublesome through the formation of air-bubbles, being shut out by having breathing-vents outside the body, is of a milder kind, and variegates the body with white spots, generating other diseases also of a similar character. But when mingled with black bile, and dispersed about the most divine circulations of the head, it acts as a disturbing agent, though with less violence during sleep; but if it come to those who are awake, it cannot be expelled without difficulty; and as this is a disease of a sacred nature or organ, *i.e.* the head, it is most justly called sacred. An acid and salt phlegm again is the source of all those diseases which are produced by a defluxion of humours: and because the places into which this phlegm flows are of infinite variety, it produces all kinds of diseases. But whatever parts of the body are said to be inflamed, all become so from being burnt and inflamed by bile.

Now this bile, whenever it makes an expiration, boils and sends up all kinds of tumours, and when inwardly restrained, generates many inflammatory diseases,—but the greatest of all, when mingled with pure blood it disturbs the order of the fibres, which are scattered in the blood for this purpose,—namely, of giving it certain measures of tenuity and density, and that it may neither through heat as being moist flow from the thin body, nor from its density become unadapted to motion, and so experience difficulty in flowing back in the veins. The just temperament, then, of these things is under the natural guardianship of the fibres; because if any one collects them together in the blood when dead and in a state of coldness, all the remaining blood becomes diffused; and when let out quickly, it coagulates in consequence of the cold surrounding it. The fibres possessing this influence over the blood, the bile, which is of the nature of ancient blood, and again changed into it from flesh by liquefaction, first gradually falls in a warm, moist state, and becomes coagulated through the power of the fibres; though when coagulated and violently extinguished, it causes a tempest and tremor within. When it flows with still greater force, it overcomes the fibres by its own proper heat, and by its ebullition drives them into disorder; and if it retains its prevalence to the end, it penetrates into the marrow, and burning the bonds of the soul, as if they were the cables of a ship, dissolves their union, and sets it wholly free; but, on the other hand, when it flows less abundantly, and the body on becoming liquefied opposes its passage, it then, on finding itself overcome, either escapes through the whole body, or being driven through the veins into the upper or lower belly, escapes from the body like a fugitive from a seditious city, and introduces defluxions, dysenteries, or gripings of the intestines, and all diseases of a similar kind. When the body, therefore, is unusually diseased by an excess of fire, it then labours under continued burnings and fever; but when through excess of air, under quotidian fevers: under tertian through water, because water is less active than fire and air; and under quartan, through excess of earth;—for earth, being of all of them the least active, becomes purified in quadruple periods of time, and hence introduces quartan fevers, which are with difficulty dispelled.

In the above manner are the diseases of the body produced; but the diseases of the soul, resulting from the habit of the body, are as follows. We must admit that the disease of the soul is folly, or a privation of intellect; and that there are two kinds of folly; the one madness, the other ignorance. Whatever passion, therefore, a person experiences that induces either of them, must be called a disease. Excessive pleasures and pains, however, are what we should deem the greatest diseases of the soul:—for when a man is over-elevated with joy or unduly depressed with grief, and so hastens immoderately either to retain the one or fly from the other, he can neither perceive nor hear anything properly, but is agitated with fury, and very little capable of exercising the reasoning power. But he who possesses a great quantity of fluid-seed about the marrow, and is by nature like a tree over-laden with fruit, such a one having many throes, and also many pleasures in his desires and their attendant offspring,—being maddened too during most of his life by the greatest pleasures and pains, having a soul also rendered morbid and unwise by the body, is wrongly deemed to be—not diseased, but voluntarily bad. In truth, however, sexual intemperance generally becomes a disease of the soul, through a particular state of fluidity and moisture caused by the tenuity of the bones. And indeed it may almost be asserted, that all intemperance in any kind of pleasure, and all disgraceful conduct, is not properly blamed as the consequence of voluntary guilt. For no one is voluntarily bad: but he who is depraved becomes so through a certain bad habit of body and an ill-governed education; and to every one these are inimical, as they result in a certain evil. And again, in the matter of pain, the soul suffers much depravity through the body. For where acid and salt phlegm, and likewise bitter and bilious humours, wandering through the body, get no external vent, but revolve inwardly, and mingle their exhalations with the circulation of the soul; they in this case produce within it an infinite variety of diseases, greater or less in degree,—more or less in numbers. They are introduced, indeed, to three seats of the soul; and according to the diversity of the place, each begets every variety of difficulty and sorrow, rashness and timidity, and still further of oblivion and indocility. Besides this also, the vicious manners of cities, and discourses both private and public, often contribute to increase this malady; nor are any branches of learning taught in early life which tend to serve as remedies for such mighty ills;—and thus all the vicious are vicious through two most involuntary causes, which we should always ascribe rather to the planters than the things planted, and to the trainers rather than those trained; but still it should be our anxious endeavor, as far as we can, by education, studies, and learning, to fly from vice, and acquire its contrary—virtue. These particulars, however, require another mode of argument.

Again, as respects the contrary of these, it is quite fit and proper to explain concerning the cultivation both of the body and the intellect, by what means each is to be healthfully preserved. For it is more just to take account of good things, rather than of the evil. Now every thing good is beautiful; and the beautiful is not without measure:—an animal therefore destined to be such, must possess symmetry. Of symmetries, however, we perceive and understand those which are small; but as for the greatest and most important, of these we are quite ignorant. For indeed, no symmetry or want of measure is of more importance with respect to health and disease, virtue and vice, than that of the soul towards the body:—and yet into these we make no inquiry, nor do we reflect that when a weaker and inferior form is the vehicle of a strong and every way mighty soul, and when on the contrary these two pass into a state of compact union, then the animal is not wholly beautiful; for it is without symmetry in the most important points of symmetry, while an animal of opposite character is the fairest of all sights that can be beheld. Just therefore, as a body has immoderately long legs, or indeed any other superfluity of parts that hinders its internal symmetry, it at once becomes base, in the participation of labour suffers many afflictions and many convulsions, and through suffering an aggregation of accidents, becomes the cause to itself of innumerable ills. The same too must be understood concerning that compound essence of body and soul, which we term an animal:—as, for instance, when the soul in this compound is stronger than the body, and greatly prevails over it, then the soul, agitating the whole of it inwardly, fills it with diseases; and, by ardent application to learned pursuits and investigations, causes it to waste away. Lastly, when the soul employs itself in didactic pursuits and logomachies, publicly as well as in private, through a certain ambitious strife, it then inflames the body and dissolves its constitution, and by introducing distillations of humours, deceives the great part of those who are called physicians, inducing them to consider these effects as proceeding from contrary causes.

Also, when a body that is large and superior to the soul in power is joined with a small and weak intellect,—there being naturally two classes of desires in man, one of aliment on account of the body, the other of wisdom for the sake of our most divine part;—in this case, the motions of the more powerful prevailing and enlarging what is their own, but making the reflective part of the soul deaf, indocile, and oblivious, thus induce ignorance—the greatest of all diseases. There is one safety then for both—neither to move the soul without the body, nor the body without the soul; in order that by mutually resisting each other they may be equally balanced and in perfect health.

The mathematician then, or any one else who ardently devotes himself to any intellectual pursuit, should at the same time engage the body in gymnastic exercises;—and the man, again, who is careful in rightly forming his body, should at the same time therewith unite the motions of the soul in the exercises of music and all philosophy; if at least he intends to be one, that may justly be called beautiful and at the same time right good.

In this very same manner we ought to attend even to the parts of the body, that they may imitate the form of the whole:—for when the body is inwardly burnt and cooled by the things that enter it, and again, is moistened by things external, and suffers all the consequences of these affections; then if any one gives up his body when quiescent to these kinds of motions, he is overcome and perishes. But if any one will imitate what we called the tutor and nurse of the universe, and never allow the body to be at rest, but perpetually move it and assist its natural motions both within and without, by ever implanting in it certain agitations, and also by moderate agitation bring into order according to their mutual relations the wandering passions and parts of the body, he will not, as we said in our former discourse about the universe, place foe against foe, and suffer war and disease to be produced in the body,—but, on the other hand, combining friend with friend, will contrive to induce a state of sound health. Of all motions, again, that is the best which takes place in itself from itself: for this is particularly allied to intellect and the motion of the universe,—that produced by another being inferior:—whereas that is the worst of all motions, which, when the body is recumbent and at ease, moves it by means of others and only partially. Hence, therefore, of all modes of cleansing and giving consistence to the body, the best is that effected by gymnastics,—the second is that caused by easy conveyance, either in a ship or other suitable vehicle; but the third kind of motion, however useful perhaps to one in extreme need, must on no account be otherwise used by any one endued with intellect; and this is that medical kind of motion produced by pharmaceutical purgation:—for diseases, unless they are extremely dangerous, must not be irritated by medicines. Indeed, every form of disease in some respect resembles the nature of animals;—for the condition of the latter has allotted to it stated periods of life, both as respects individuals and entire races, and each animal separately of itself has its fated life apart from the affection arising from necessity:—because the triangles, which from the very first have power over each, are so composed, as to suffice only for a certain time: beyond which period no animal can extend its life. The same condition of things also takes place in the case of diseases; for if any one destroys them by medicine before the fated time, he will only produce great diseases out of small, and many out of few. On this account we must discipline all such maladies by proper diet, according as each has leisure, and not irritate by medicines an obstinate complaint.—And thus much may suffice to have been said concerning the common animal and its corporeal part,—how each governing himself and governed by himself, may pursue a life regulated by reason.

That part, however, which is to have the government of the animal, should, as far as possible, be better provided, and earlier also, with the power of being the fairest and best in the art of ruling. To treat accurately indeed of these matters, would require a separate work of itself: but even pursuing it by way of mere by-work ἐν παρέργῳ in accordance with what has preceded, we shall not be inconsistent, nor fail in the end of our inquiries. We have often then before asserted that there are three kinds of soul within us, in three parts of the body, each having its peculiar motions; and so in the same way we must now briefly affirm, that when any one of them is in a torpid state and rests from its own proper motions, it must necessarily become extremely weak, and only by constant exercise attains the highest degree of strength:—we should be careful therefore that each may preserve its own motions in symmetry with all the rest.

But with respect to the highest and most leading part of our soul, *i.e.* the human soul, we should conceive as follows:—that the Deity assigned this to each as a dæmon;—that, namely, which we say, and say correctly too, resides at the summit of the body and raises us from earth to our cognate place in heaven:—for we are plants, not of earth, but heaven; and from the same source whence the soul first arose, a divine nature, raising aloft our head and root, directs our whole corporeal frame. In him, therefore, who has eagerly striven to satisfy the cravings of desire and ambition, all the conceptions engendered in his soul must necessarily be mortal; and he will necessarily, as much as possible, become entirely mortal, omitting no effort to improve such a nature. For one, however, who is sedulously employed in the acquisition of knowledge and true wisdom, and is chiefly practised in this one pursuit, it is altogether necessary, if he would touch on the truth, that he should be endued with wisdom about immortal and divine concerns; and as far as human nature is capable of immortality, he should leave no part neglected; and thus, as he ever cultivates that which is divine, and has a dæmon most excellently adorned residing within him, he will be exceedingly happy. But the culture of all the parts is one only,—that of assigning to each their proper nutriment and motion. But the motions allied to the divine part of our nature, are the reflective energies and circulations of the universe. These, then, each of us should pursue; restoring the revolutions in our head that have been corrupted through being employed on generation, by a diligent investigation of the harmonies and circulations of the universe, with the view of assimilating the reflective power to the object of reflection according to its ancient nature; for, by this assimilation, we shall obtain the end of the best life proposed by the gods to men, both present and future.

And now the discussion which we announced at the beginning concerning the universe, as far at least as concerns the generation of man, is very nearly completed; for as to the rest of the animals, how they were generated, we will only briefly describe them, except where necessity bids us enlarge: for a person may think that he is thus more in measure as concerns such an inquiry. On this subject, then, let us speak as follows:—Of the men that were born, such as are timid, and have passed through life unjustly, are, we suppose, changed into women in their second generation. At that time, then, and for that reason, the gods devised the love of copulation; constructing an animated substance, and placing one in us men, another in the women,—forming each in the following manner:—That passage for the drink, by which these liquids run through the lungs under the reins into the bladder, and which sends them forth as it receives them, by the pressure of the breath,—this the gods made to pass into the condensed marrow, from the head, along the neck, and through the back-bone; and this we called seed in a former part of this discourse:—and this the marrow, in consequence of being animated and endued with respiration, produces in the part where it respires a lively desire of emission,—thus perfecting in us the love of procreation. On this account, the nature of men, as respects their private parts, becoming insubordinate and imperious, like an animal not obedient to reason, tries through raging desire to gain absolute sway. The same is the case with the wombs, and other connected parts of women,—so called, as forming an animal desirous of procreating children. This, when it remains without fruit long beyond its proper time, becomes discontented and indignant; and wandering every way through the body, it obstructs the passage of the breath, and throws women into extreme difficulties, causing all varieties of diseases, till at length the desire and love of both parties *i.e.* the man and woman cause the emission of seed, like fruit from a tree; by which emission, they sow in the womb, as in a field, animals invisible from their minute size, and yet unformed, which, as they become larger, they nourish within; and lastly, by bringing them to light, perfect the generation of animals.

Such is the process of generation in women and every female. Next succeeded the tribe of birds having feathers instead of hair, which were fashioned from men without vice indeed, but light-minded and curious about things on high, yet conceiving in their folly that the strongest proofs of these things are received through the sight *i.e.* the senses. Again, the race of wild animals with feet was generated from men, who made no use of philosophy, nor ever inquired into anything that concerned the nature of the universe,—and this, because they no longer employed the circulations in the head, but followed the guidance of those parts of the soul that reside about the breast. Owing to these pursuits, therefore, they fixed their fore-legs and head earthwards, as suited their nature,—having also long and variously-shaped heads, where the circulations of each were compressed by inactivity:—and hence their race became quadruped and multiped, the Deity giving a greater number of feet to those more than usually unwise, that they might be the more drawn towards the earth. But as regards the most unwise of these, which extend all their body along the ground, as if they had no longer any need for feet, the gods formed them without feet to creep on the earth. The fourth class is that living in the water, which was produced from such men as were to the last degree unthinking and ignorant, and whom those transformers of our nature did not think deserving of a pure medium of respiration, because they possessed a soul rendered impure by extreme transgression,—but drove them from the attenuated and pure atmosphere into the turbid and deep breathing-medium of water:—and hence arose the tribe of fishes and oysters, and all other aquatic animals, which have received the most remote habitations, as a punishment of their extreme ignorance. After this manner then, both formerly and now, animals migrate into each other; experiencing their changes through either the loss or acquisition of intellect and folly. We are now at length to say, that our discourse about the universe has reached its conclusion;—for not only containing, but full of mortal and immortal animals, it has thus been formed *a visible animal embracing things visible*, *a sensible god of the intelligible*, *the greatest*, *best*, *and most perfect*,*—this one only-begotten* **UNIVERSE**.

THE END OF THE TIMÆUS.

# **Timaeus.**

Translated by Jowett 3rd ed.

PERSONS OF THE DIALOGUE.

Socrates. Critias.
Timaeus. Hermocrates.

Socrates:: One, two, three; but where, my dear Timaeus, is the fourth of those who were yesterday my guests and are to be my entertainers to-day?

Timaeus:: He has been taken ill, Socrates; for he would not willingly have been absent from this gathering.

Socrates:: Then, if he is not coming, you and the two others must supply his place.

Timaeus:: Certainly, and we will do all that we can; having been handsomely entertained by you yesterday, those of us who remain should be only too glad to return your hospitality.

Socrates:: Do you remember what were the points of which I required you to speak?

Timaeus:: We remember some of them, and you will be here to remind us of anything which we have forgotten: or rather, if we are not troubling you, will you briefly recapitulate the whole, and then the particulars will be more firmly fixed in our memories?

Socrates:: To be sure I will: the chief theme of my yesterday's discourse was the State—how constituted and of what citizens composed it would seem likely to be most perfect.

Timaeus:: Yes, Socrates; and what you said of it was very much to our mind.

Socrates:: Did we not begin by separating the husbandmen and the artisans from the class of defenders of the State?

Timaeus:: Yes.

Socrates:: And when we had given to each one that single employment and particular art which was suited to his nature, we spoke of those who were intended to be our warriors, and said that they were to be guardians of the city against attacks from within as well as from without, and to have no other employment; they were to be merciful in judging their subjects, of whom they were by nature friends, but fierce to their enemies, when they came across them in battle.

Timaeus:: Exactly.

Socrates:: We said, if I am not mistaken, that the guardians should be gifted with a temperament in a high degree both passionate and philosophical; and that then they would be as they ought to be, gentle to their friends and fierce with their enemies.

Timaeus:: Certainly.

Socrates:: And what did we say of their education? Were they not to be trained in gymnastic, and music, and all other sorts of knowledge which were proper for them?

Timaeus:: Very true.

Socrates:: And being thus trained they were not to consider gold or silver or anything else to be their own private property; they were to be like hired troops, receiving pay for keeping guard from those who were protected by them—the pay was to be no more than would suffice for men of simple life; and they were to spend in common, and to live together in the continual practice of virtue, which was to be their sole pursuit.

Timaeus:: That was also said.

Socrates:: Neither did we forget the women; of whom we declared, that their natures should be assimilated and brought into harmony with those of the men, and that common pursuits should be assigned to them both in time of war and in their ordinary life.

Timaeus:: That, again, was as you say.

Socrates:: And what about the procreation of children? Or rather was not the proposal too singular to be forgotten? for all wives and children were to be in common, to the intent that no one should ever know his own child, but they were to imagine that they were all one family; those who were within a suitable limit of age were to be brothers and sisters, those who were of an elder generation parents and grandparents, and those of a younger, children and grandchildren.

Timaeus:: Yes, and the proposal is easy to remember, as you say.

Socrates:: And do you also remember how, with a view of securing as far as we could the best breed, we said that the chief magistrates, male and female, should contrive secretly, by the use of certain lots, so to arrange the nuptial meeting, that the bad of either sex and the good of either sex might pair with their like; and there was to be no quarrelling on this account, for they would imagine that the union was a mere accident, and was to be attributed to the lot?

Timaeus:: I remember.

Socrates:: And you remember how we said that the children of the good parents were to be educated, and the children of the bad secretly dispersed among the inferior citizens; and while they were all growing up the rulers were to be on the look-out, and to bring up from below in their turn those who were worthy, and those among themselves who were unworthy were to take the places of those who came up?

Timaeus:: True.

Socrates:: Then have I now given you all the heads of our yesterday's discussion? Or is there anything more, my dear Timaeus, which has been omitted?

Timaeus:: Nothing, Socrates; it was just as you have said.

Socrates:: I should like, before proceeding further, to tell you how I feel about the State which we have described. I might compare myself to a person who, on beholding beautiful animals either created by the painter's art, or, better still, alive but at rest, is seized with a desire of seeing them in motion or engaged in some struggle or conflict to which their forms appear suited; this is my feeling about the State which we have been describing. There are conflicts which all cities undergo, and I should like to hear some one tell of our own city carrying on a struggle against her neighbours, and how she went out to war in a becoming manner, and when at war showed by the greatness of her actions and the magnanimity of her words in dealing with other cities a result worthy of her training and education. Now I, Critias and Hermocrates, am conscious that I myself should never be able to celebrate the city and her citizens in a befitting manner, and I am not surprised at my own incapacity; to me the wonder is rather that the poets present as well as past are no better—not that I mean to depreciate them; but every one can see that they are a tribe of imitators, and will imitate best and most easily the life in which they have been brought up; while that which is beyond the range of a man's education he finds hard to carry out in action, and still harder adequately to represent in language. I am aware that the

Sophists have plenty of brave words and fair conceits, but I am afraid that being only wanderers from one city to another, and having never had habitations of their own, they may fail in their conception of philosophers and statesmen, and may not know what they do and say in time of war, when they are fighting or holding parley with their enemies. And thus people of your class are the only ones remaining who are fitted by nature and education to take part at once both in politics and philosophy. Here is Timaeus, of Locris in Italy, a city which has admirable laws, and who is himself in wealth and rank the equal of any of his fellow-citizens; he has held the most important and honourable offices in his own state, and, as I believe, has scaled the heights of all philosophy; and here is Critias, whom every Athenian knows to be no novice in the matters of which we are speaking; and as to Hermocrates, I am assured by many witnesses that his genius and education qualify him to take part in any speculation of the kind. And therefore yesterday when I saw that you wanted me to describe the formation of the State, I readily assented, being very well aware, that, if you only would, none were better qualified to carry the discussion further, and that when you had engaged our city in a suitable war, you of all men living could best exhibit her playing a fitting part. When I had completed my task, I in return imposed this other task upon you. You conferred together and agreed to entertain me to-day, as I had entertained you, with a feast of discourse. Here am I in festive array, and no man can be more ready for the promised banquet.

Hermocrates:: And we too, Socrates, as Timaeus says, will not be wanting in enthusiasm; and there is no excuse for not complying with your request. As soon as we arrived yesterday at the guest-chamber of Critias, with whom we are staying, or rather on our way thither, we talked the matter over, and he told us an ancient tradition, which I wish, Critias, that you would repeat to Socrates, so that he may help us to judge whether it will satisfy his requirements or not.

Critias:: I will, if Timaeus, who is our other partner, approves.

Timaeus:: I quite approve.

Critias:: Then listen, Socrates, to a tale which, though strange, is certainly true, having been attested by Solon, who was the wisest of the seven sages. He was a relative and a dear friend of my great-grandfather, Dropides, as he himself says in many passages of his poems; and he told the story to Critias, my grandfather, who remembered and repeated it to us. There were of old, he said, great and marvellous actions of the Athenian city, which have passed into oblivion through lapse of time and the destruction of mankind, and one in particular, greater than all the rest. This we will now rehearse. It will be a fitting monument of our gratitude to you, and a hymn of praise true and worthy of the goddess, on this her day of festival.

Socrates:: Very good. And what is this ancient famous action of the Athenians, which Critias declared, on the authority of Solon, to be not a mere legend, but an actual fact?

Critias:: I will tell an old-world story which I heard from an aged man; for Critias, at the time of telling it, was, as he said, nearly ninety years of age, and I was about ten. Now the day was that day of the Apaturia which is called the Registration of Youth, at which, according to custom, our parents gave prizes for recitations, and the poems of several poets were recited by us boys, and many of us sang the poems of Solon, which at that time had not gone out of fashion. One of our tribe, either because he thought so or to please Critias, said that in his judgment Solon was not only the wisest of men, but also the noblest of poets. The old man, as I very well remember, brightened up at hearing this and said, smiling: Yes, Amynander, if Solon had only, like other poets, made poetry the business of his life, and had completed the tale which he brought with him from Egypt, and had not been compelled, by reason of the factions and troubles which he found stirring in his own country when he came home, to attend to other matters, in my opinion he would have been as famous as Homer or Hesiod, or any poet.

And what was the tale about, Critias? said Amynander.

About the greatest action which the Athenians ever did, and which ought to have been the most famous, but, through the lapse of time and the destruction of the actors, it has not come down to us.

Tell us, said the other, the whole story, and how and from whom Solon heard this veritable tradition.

He replied:—In the Egyptian Delta, at the head of which the river Nile divides, there is a certain district which is called the district of Sais, and the great city of the district is also called Sais, and is the city from which King Amasis came. The citizens have a deity for their foundress; she is called in the Egyptian tongue Neith, and is asserted by them to be the same whom the Hellenes call Athene; they are great lovers of the Athenians, and say that they are in some way related to them. To this city came Solon, and was received there with great honour; he asked the priests who were most skilful in such matters, about antiquity, and made the discovery that neither he nor any other Hellene knew anything worth mentioning about the times of old. On one occasion, wishing to draw them on to speak of antiquity, he began to tell about the most ancient things in our part of the world—about Phoroneus, who is called ‘the first man’ and about Niobe; and after the Deluge, of the survival of Deucalion and Pyrrha; and he traced the genealogy of their descendants, and reckoning up the dates, tried to compute how many years ago the events of which he was speaking happened. Thereupon one of the priests, who was of a very great age, said: O Solon, Solon, you Hellenes are never anything but children, and there is not an old man among you. Solon in return asked him what he meant. I mean to say, he replied, that in mind you are all young; there is no old opinion handed down among you by ancient tradition, nor any science which is hoary with age. And I will tell you why. There have been, and will be again, many destructions of mankind arising out of many causes; the greatest have been brought about by the agencies of fire and water, and other lesser ones by innumerable other causes. There is a story, which even you have preserved, that once upon a time Phaethon, the son of Helios, having yoked the steeds in his father’s chariot, because he was not able to drive them in the path of his father, burnt up all that was upon the earth, and was himself destroyed by a thunderbolt. Now this has the form of a myth, but really signifies a declination of the bodies moving in the heavens around the earth, and a great conflagration of things upon the earth, which recurs after long intervals; at such times those who live upon the mountains and in dry and lofty places are more liable to destruction than those who dwell by rivers or on the seashore. And from this calamity the Nile, who is our never-failing saviour, delivers and preserves us. When, on the other hand, the gods purge the earth with a deluge of water, the survivors in your country are herdsmen and shepherds who dwell on the mountains, but those who, like you, live in cities are carried by the rivers into the sea.

Whereas in this land, neither then nor at any other time, does the water come down from above on the fields, having always a tendency to come up from below; for which reason the traditions preserved here are the most ancient. The fact is, that wherever the extremity of winter frost or of summer sun does not prevent, mankind exist, sometimes in greater, sometimes in lesser numbers. And whatever happened either in your country or in ours, or in any other region of which we are informed—if there were any actions noble or great or in any other way remarkable, they have all been written down by us of old, and are preserved in our temples. Whereas just when you and other nations are beginning to be provided with letters and the other requisites of civilized life, after the usual interval, the stream from heaven, like a pestilence, comes pouring down, and leaves only those of you who are destitute of letters and education; and so you have to begin all over again like children, and know nothing of what happened in ancient times, either among us or among yourselves. As for those genealogies of yours which you just now recounted to us, Solon, they are no better than the tales of children. In the first place you remember a single deluge only, but there were many previous ones; in the next place, you do not know that there formerly dwelt in your land the fairest and noblest race of men which ever lived, and that you and your whole city are descended from a small seed or remnant of them which survived. And this was unknown to you, because, for many generations, the survivors of that destruction died, leaving no written word. For there was a time, Solon, before the great deluge of all, when the city which now is Athens was first in war and in every way the best governed of all cities, and is said to have performed the noblest deeds and to have had the fairest constitution of any of which tradition tells, under the face of heaven.

Solon marvelled at his words, and earnestly requested the priests to inform him exactly and in order about these former citizens. You are welcome to hear about them, Solon, said the priest, both for your own sake and for that of your city, and above all, for the sake of the goddess who is the common patron and parent and educator of both our cities. She founded your city a thousand years before ours, receiving from the Earth and Hephaestus the seed of your race, and afterwards she founded ours, of which the constitution is recorded in our sacred registers to be 8000 years old. As touching your citizens of 9000 years ago, I will briefly inform you of their laws and of their most famous action; the exact particulars of the whole we will hereafter go through at our leisure in the sacred registers themselves. If you compare these very laws with ours you will find that many of ours are the counterpart of yours as they were in the olden time. In the first place, there is the caste of priests, which is separated from all the others; next, there are the artificers, who ply their several crafts by themselves and do not intermix; and also there is the class of shepherds and of hunters, as well as that of husbandmen; and you will observe, too, that the warriors in Egypt are distinct from all the other classes, and are commanded by the law to devote themselves solely to military pursuits; moreover, the weapons which they carry are shields and spears, a style of equipment which the goddess taught of Asiatics first to us, as in your part of the world first to you. Then as to wisdom, do you observe how our law from the very first made a study of the whole order of things, extending even to prophecy and medicine which gives health; out of these divine elements deriving what was needful for human life, and adding every sort of knowledge which was akin to them. All this order and arrangement the goddess first imparted to you when establishing your city; and she chose the spot of earth in which you were born, because she saw that the happy temperament of the seasons in that land would produce the wisest of men. Wherefore the goddess, who was a lover both of war and of wisdom, selected and first of all settled that spot which was the most likely to produce men likest herself. And there you dwelt, having such laws as these and still better ones, and excelled all mankind in all virtue, as became the children and disciples of the gods.

Many great and wonderful deeds are recorded of your state in our histories. But one of them exceeds all the rest in greatness and valour. For these histories tell of a mighty power which unprovoked made an expedition against the whole of Europe and Asia, and to which your city put an end. This power came forth out of the Atlantic Ocean, for in those days the Atlantic was navigable; and there was an island situated in front of the straits which are by you called the pillars of Heracles; the island was larger than Libya and Asia put together, and was the way to other islands, and from these you might pass to the whole of the opposite continent which surrounded the true ocean; for this sea which is within the Straits of Heracles is only a harbour, having a narrow entrance, but that other is a real sea, and the surrounding land may be most truly called a boundless continent. Now in this island of Atlantis there was a great and wonderful empire which had rule over the whole island and several others, and over parts of the continent, and, furthermore, the men of Atlantis had subjected the parts of Libya within the columns of Heracles as far as Egypt, and of Europe as far as Tyrrhenia. This vast power, gathered into one, endeavored to subdue at a blow our country and yours and the whole of the region within the straits; and then, Solon, your country shone forth, in the excellence of her virtue and strength, among all mankind. She was preeminent in courage and military skill, and was the leader of the Hellenes. And when the rest fell off from her, being compelled to stand alone, after having undergone the very extremity of danger, she defeated and triumphed over the invaders, and preserved from slavery those who were not yet subjugated, and generously liberated all the rest of us who dwell within the pillars. But afterwards there occurred violent earthquakes and floods; and in a single day and night of misfortune all your warlike men in a body sank into the earth, and the island of Atlantis in like manner disappeared in the depths of the sea. For which reason the sea in those parts is impassable and impenetrable, because there is a shoal of mud in the way; and this was caused by the subsidence of the island.

I have told you briefly, Socrates, what the aged Critias heard from Solon and related to us. And when you were speaking yesterday about your city and citizens, the tale which I have just been repeating to you came into my mind, and I remarked with astonishment how, by some mysterious coincidence, you agreed in almost every particular with the narrative of Solon; but I did not like to speak at the moment. For a long time had elapsed, and I had forgotten too much; I thought that I must first of all run over the narrative in my own mind, and then I would speak. And so I readily assented to your request yesterday, considering that in all such cases the chief difficulty is to find a tale suitable to our purpose, and that with such a tale we should be fairly well provided.

And therefore, as Hermocrates has told you, on my way home yesterday I at once communicated the tale to my companions as I remembered it; and after I left them, during the night by thinking I recovered nearly the whole of it. Truly, as is often said, the lessons of our childhood make a wonderful impression on our memories; for I am not sure that I could remember all the discourse of yesterday, but I should be much surprised if I forgot any of these things which I have heard very long ago. I listened at the time with childlike interest to the old man's narrative; he was very ready to teach me, and I asked him again and again to repeat his words, so that like an indelible picture they were branded into my mind. As soon as the day broke, I rehearsed them as he spoke them to my companions, that they, as well as myself, might have something to say. And now, Socrates, to make an end of my preface, I am ready to tell you the whole tale. I will give you not only the general heads, but the particulars, as they were told to me. The city and citizens, which you yesterday described to us in fiction, we will now transfer to the world of reality. It shall be the ancient city of Athens, and we will suppose that the citizens whom you imagined, were our veritable ancestors, of whom the priest spoke; they will perfectly harmonize, and there will be no inconsistency in saying that the citizens of your republic are these ancient Athenians. Let us divide the subject among us, and all endeavor according to our ability gracefully to execute the task which you have imposed upon us. Consider then, Socrates, if this narrative is suited to the purpose, or whether we should seek for some other instead.

Socrates:: And what other, Critias, can we find that will be better than this, which is natural and suitable to the festival of the goddess, and has the very great advantage of being a fact and not a fiction? How or where shall we find another if we abandon this? We cannot, and therefore you must tell the tale, and good luck to you; and I in return for my yesterday's discourse will now rest and be a listener.

Critias:: Let me proceed to explain to you, Socrates, the order in which we have arranged our entertainment. Our intention is, that Timaeus, who is the most of an astronomer amongst us, and has made the nature of the universe his special study, should speak first, beginning with the generation of the world and going down to the creation of man; next, I am to receive the men whom he has created, and of whom some will have profited by the excellent education which you have given them; and then, in accordance with the tale of Solon, and equally with his law, we will bring them into court and make them citizens, as if they were those very Athenians whom the sacred Egyptian record has recovered from oblivion, and thenceforward we will speak of them as Athenians and fellow-citizens.

Socrates:: I see that I shall receive in my turn a perfect and splendid feast of reason. And now, Timaeus, you, I suppose, should speak next, after duly calling upon the Gods.

Timaeus:: All men, Socrates, who have any degree of right feeling, at the beginning of every enterprise, whether small or great, always call upon God. And we, too, who are going to discourse of the nature of the universe, how created or how existing without creation, if we be not altogether out of our wits, must invoke the aid of Gods and Goddesses and pray that our words may be acceptable to them and consistent with themselves. Let this, then, be our invocation of the Gods, to which I add an exhortation of myself to speak in such manner as will be most intelligible to you, and will most accord with my own intent.

First then, in my judgment, we must make a distinction and ask, What is that which always is and has no becoming; and what is that which is always becoming and never is? That which is apprehended by intelligence and reason is always in the same state; but that which is conceived by opinion with the help of sensation and without reason, is always in a process of becoming and perishing and never really is. Now everything that becomes or is created must of necessity be created by some cause, for without a cause nothing can be created. The work of the creator, whenever he looks to the unchangeable and fashions the form and nature of his work after an unchangeable pattern, must necessarily be made fair and perfect; but when he looks to the created only, and uses a created pattern, it is not fair or perfect. Was the heaven then or the world, whether called by this or by any other more appropriate name—assuming the name, I am asking a question which has to be asked at the beginning of an enquiry about anything—was the world, I say, always in existence and without beginning? or created, and had it a beginning? Created, I reply, being visible and tangible and having a body, and therefore sensible; and all sensible things are apprehended by opinion and sense and are in a process of creation and created. Now that which is created must, as we affirm, of necessity be created by a cause. But the father and maker of all this universe is past finding out; and even if we found him, to tell of him to all men would be impossible. And there is still a question to be asked about him: Which of the patterns had the artificer in view when he made the world,—the pattern of the unchangeable, or of that which is created? If the world be indeed fair and the artificer good, it is manifest that he must have looked to that which is eternal; but if what cannot be said without blasphemy is true, then to the created pattern. Every one will see that he must have looked to the eternal for the world is the fairest of creations and he is the best of causes. And having been created in this way, the world has been framed in the likeness of that which is apprehended by reason and mind and is unchangeable, and must therefore of necessity, if this is admitted, be a copy of something. Now it is all-important that the beginning of everything should be according to nature. And in speaking of the copy and the original we may assume that words are akin to the matter which they describe; when they relate to the lasting and permanent and intelligible, they ought to be lasting and unalterable, and, as far as their nature allows, irrefutable and immovable—nothing less. But when they express only the copy or likeness and not the eternal things themselves, they need only be likely and analogous to the real words. As being is to becoming, so is truth to belief. If then, Socrates, amid the many opinions about the gods and the generation of the universe, we are not able to give notions which are altogether and in every respect exact and consistent with one another, do not be surprised. Enough, if we adduce probabilities as likely as any others; for we must remember that I who am the speaker, and you who are the judges, are only mortal men, and we ought to accept the tale which is probable and enquire no further.

Socrates:: Excellent, Timaeus; and we will do precisely as you bid us. The prelude is charming, and is already accepted by us—may we beg of you to proceed to the strain?

Timaeus:: Let me tell you then why the creator made this world of generation. He was good, and the good can never have any jealousy of anything. And being free from jealousy, he desired that all things should be as like himself as they could be. This is in the truest sense the origin of creation and of the world, as we shall do well in believing on the testimony of wise men: God desired that all things should be good and nothing bad, so far as this was attainable. Wherefore also finding the whole visible sphere not at rest, but moving in an irregular and disorderly fashion, out of disorder he brought order, considering that this was in every way better than the other, Now the deeds of the best could never be or have been other than the fairest; and the creator, reflecting on the things which are by nature visible, found that no unintelligent creature taken as a whole was fairer than the intelligent taken as a whole; and that intelligence could not be present in anything which was devoid of soul. For which reason, when he was framing the universe, he put intelligence in soul, and soul in body, that he might be the creator of a work which was by nature fairest and best. Wherefore, using the language of probability, we may say that the world became a living creature truly endowed with soul and intelligence by the providence of God.

This being supposed, let us proceed to the next stage: In the likeness of what animal did the Creator make the world?

It would be an unworthy thing to liken it to any nature which exists as a part only; for nothing can be beautiful which is like any imperfect thing; but let us suppose the world to be the very image of that whole of which all other animals both individually and in their tribes are portions. For the original of the universe contains in itself all intelligible beings, just as this world comprehends us and all other visible creatures. For the Deity, intending to make this world like the fairest and most perfect of intelligible beings, framed one visible animal comprehending within itself all other animals of a kindred nature. Are we right in saying that there is one world, or that they are many and infinite? There must be one only, if the created copy is to accord with the original. For that which includes all other intelligible creatures cannot have a second or companion; in that case there would be need of another living being which would include both, and of which they would be parts, and the likeness would be more truly said to resemble not them, but that other which included them. In order then that the world might be solitary, like the perfect animal, the creator made not two worlds or an infinite number of them; but there is and ever will be one only-begotten and created heaven.

Now that which is created is of necessity corporeal, and also visible and tangible. And nothing is visible where there is no fire, or tangible which has no solidity, and nothing is solid without earth. Wherefore also God in the beginning of creation made the body of the universe to consist of fire and earth. But two things cannot be rightly put together without a third; there must be some bond of union between them. And the fairest bond is that which makes the most complete fusion of itself and the things which it combines; and proportion is best adapted to effect such a union. For whenever in any three numbers, whether cube or square, there is a mean, which is to the last term what the first term is to it; and again, when the mean is to the first term as the last term is to the mean,—then the mean becoming first and last, and the first and last both becoming means, they will all of them of necessity come to be the same, and having become the same with one another will be all one. If the universal frame had been created a surface only and having no depth, a single mean would have sufficed to bind together itself and the other terms; but now, as the world must be solid, and solid bodies are always compacted not by one mean but by two, God placed water and air in the mean between fire and earth, and made them to have the same proportion so far as was possible (as fire is to air so is air to water, and as air is to water so is water to earth); and thus he bound and put together a visible and tangible heaven. And for these reasons, and out of such elements which are in number four, the body of the world was created, and it was harmonized by proportion, and therefore has the spirit of friendship; and having been reconciled to itself, it was indissoluble by the hand of any other than the framer.

Now the creation took up the whole of each of the four elements; for the Creator compounded the world out of all the fire and all the water and all the air and all the earth, leaving no part of any of them nor any power of them outside. His intention was, in the first place, that the animal should be as far as possible a perfect whole and of perfect parts: secondly, that it should be one, leaving no remnants out of which another such world might be created: and also that it should be free from old age and unaffected by disease. Considering that if heat and cold and other powerful forces which unite bodies surround and attack them from without when they are unprepared, they decompose them, and by bringing diseases and old age upon them, make them waste away—for this cause and on these grounds he made the world one whole, having every part entire, and being therefore perfect and not liable to old age and disease. And he gave to the world the figure which was suitable and also natural. Now to the animal which was to comprehend all animals, that figure was suitable which comprehends within itself all other figures. Wherefore he made the world in the form of a globe, round as from a lathe, having its extremes in every direction equidistant from the centre, the most perfect and the most like itself of all figures; for he considered that the like is infinitely fairer than the unlike. This he finished off, making the surface smooth all round for many reasons; in the first place, because the living being had no need of eyes when there was nothing remaining outside him to be seen; nor of ears when there was nothing to be heard; and there was no surrounding atmosphere to be breathed; nor would there have been any use of organs by the help of which he might receive his food or get rid of what he had already digested, since there was nothing which went from him or came into him: for there was nothing beside him. Of design he was created thus, his own waste providing his own food, and all that he did or suffered taking place in and by himself. For the Creator conceived that a being which was self-sufficient would be far more excellent than one which lacked anything; and, as he had no need to take anything or defend himself against any one, the Creator did not think it necessary to bestow upon him hands: nor had he any need of feet, nor of the whole apparatus of walking; but the movement suited to his spherical form was assigned to him, being of all the seven that which is most appropriate to mind and intelligence; and he was made to move in the same manner and on the same spot, within his own limits revolving in a circle. All the other six motions were taken away from him, and he was made not to partake of their deviations. And as this circular movement required no feet, the universe was created without legs and without feet.

Such was the whole plan of the eternal God about the god that was to be, to whom for this reason he gave a body, smooth and even, having a surface in every direction equidistant from the centre, a body entire and perfect, and formed out of perfect bodies. And in the centre he put the soul, which he diffused throughout the body, making it also to be the exterior environment of it; and he made the universe a circle moving in a circle, one and solitary, yet by reason of its excellence able to converse with itself, and needing no other friendship or acquaintance. Having these purposes in view he created the world a blessed god.

Now God did not make the soul after the body, although we are speaking of them in this order; for having brought them together he would never have allowed that the elder should be ruled by the younger; but this is a random manner of speaking which we have, because somehow we ourselves too are very much under the dominion of chance. Whereas he made the soul in origin and excellence prior to and older than the body, to be the ruler and mistress, of whom the body was to be the subject. And he made her out of the following elements and on this wise: Out of the indivisible and unchangeable, and also out of that which is divisible and has to do with material bodies, he compounded a third and intermediate kind of essence, partaking of the nature of the same and of the other, and this compound he placed accordingly in a mean between the indivisible, and the divisible and material. He took the three elements of the same, the other, and the essence, and mingled them into one form, compressing by force the reluctant and unsociable nature of the other into the same. When he had mingled them with the essence and out of three made one, he again divided this whole into as many portions as was fitting, each portion being a compound of the same, the other, and the essence. And he proceeded to divide after this manner:—First of all, he took away one part of the whole [1], and then he separated a second part which was double the first [2], and then he took away a third part which was half as much again as the second and three times as much as the first [3], and then he took a fourth part which was twice as much as the second [4], and a fifth part which was three times the third [9], and a sixth part which was eight times the first [8], and a seventh part which was twenty-seven times the first [27]. After this he filled up the double intervals [i.e. between 1, 2, 4, 8] and the triple [i.e. between 1, 3, 9, 27], cutting off yet other portions from the mixture and placing them in the intervals, so that in each interval there were two kinds of means, the one exceeding and exceeded by equal parts of its extremes [as for example 1, $\frac{4}{3}$, 2, in which the mean $\frac{4}{3}$ is one-third of 1 more than 1, and one-third of 2 less than 2], the other being that kind of mean which exceeds and is exceeded by an equal number. Where there were intervals of $\frac{3}{2}$ and of $\frac{4}{3}$ and of $\frac{9}{8}$, made by the connecting terms in the former intervals, he filled up all the intervals of $\frac{4}{3}$ with the interval of $\frac{9}{8}$, leaving a fraction over; and the interval which this fraction expressed was in the ratio of 256 to 243. And thus the whole mixture out of which he cut these portions was all exhausted by him. This entire compound he divided lengthways into two parts, which he joined to one another at the centre like the letter X, and bent them into a circular form, connecting them with themselves and each other at the point opposite to their original meeting-point; and, comprehending them in a uniform revolution upon the same axis, he made the one the outer and the other the inner circle. Now the motion of the outer circle he called the motion of the same, and the motion of the inner circle the motion of the other or diverse. The motion of the same he carried round by the side to the right, and the motion of the diverse diagonally to the left. And he gave dominion to the motion of the same and like, for that he left single and undivided; but the inner motion he divided in six places and made seven unequal circles having their intervals in ratios of two and three, three of each, and bade the orbits proceed in a direction opposite to one another; and three [Sun, Mercury, Venus] he made to move with equal swiftness, and the remaining four [Moon, Saturn, Mars, Jupiter] to move with unequal swiftness to the three and to one another, but in due proportion.

Now when the Creator had framed the soul according to his will, he formed within her the corporeal universe, and brought the two together, and united them centre to centre. The soul, interfused everywhere from the centre to the circumference of heaven, of which also she is the external envelopment, herself turning in herself, began a divine beginning of never-ceasing and rational life enduring through out all time. The body of heaven is visible, but the soul is invisible, and partakes of reason and harmony, and being made by the best of intellectual and everlasting natures, is the best of things created. And because she is composed of the same and of the other and of the essence, these three, and is divided and united in due proportion, and in her revolutions returns upon herself, the soul, when touching anything which has essence, whether dispersed in parts or undivided, is stirred through all her powers, to declare the sameness or difference of that thing and some other; and to what individuals are related, and by what affected, and in what way and how and when, both in the world of generation and in the world of immutable being. And when reason, which works with equal truth, whether she be in the circle of the diverse or of the same—in voiceless silence holding her onward course in the sphere of the self-moved—when reason, I say, is hovering around the sensible world and when the circle of the diverse also moving truly imparts the intimations of sense to the whole soul, then arise opinions and beliefs sure and certain. But when reason is concerned with the rational, and the circle of the same moving smoothly declares it, then intelligence and knowledge are necessarily perfected. And if any one affirms that in which these two are found to be other than the soul, he will say the very opposite of the truth.

When the father and creator saw the creature which he had made moving and living, the created image of the eternal gods, he rejoiced, and in his joy determined to make the copy still more like the original; and as this was eternal, he sought to make the universe eternal, so far as might be. Now the nature of the ideal being was everlasting, but to bestow this attribute in its fullness upon a creature was impossible. Wherefore he resolved to have a moving image of eternity, and when he set in order the heaven, he made this image eternal but moving according to number, while eternity itself rests in unity; and this image we call time. For there were no days and nights and months and years before the heaven was created, but when he constructed the heaven he created them also. They are all parts of time, and the past and future are created species of time, which we unconsciously but wrongly transfer to the eternal essence; for we say that he 'was,' he 'is,' he 'will be,' but the truth is that 'is' alone is properly attributed to him, and that 'was' and 'will be' are only to be spoken of becoming in time, for they are motions, but that which is immovably the same cannot become older or younger by time, nor ever did or has become, or hereafter will be, older or younger, nor is subject at all to any of those states which affect moving and sensible things and of which generation is the cause. These are the forms of time, which imitates eternity and revolves according to a law of number. Moreover, when we say that what has become is become and what becomes is becoming, and that what will become is about to become and that the nonexistent is non-existent,—all these are inaccurate modes of expression. But perhaps this whole subject will be more suitably discussed on some other occasion.

Time, then, and the heaven came into being at the same instant in order that, having been created together, if ever there was to be a dissolution of them, they might be dissolved together. It was framed after the pattern of the eternal nature, that it might resemble this as far as was possible; for the pattern exists from eternity, and the created heaven has been, and is, and will be, in all time. Such was the mind and thought of God in the creation of time. The sun and moon and five other stars, which are called the planets, were created by him in order to distinguish and preserve the numbers of time; and when he had made their several bodies, he placed them in the orbits in which the circle of the other was revolving,—in seven orbits seven stars. First, there was the moon in the orbit nearest the earth, and next the sun, in the second orbit above the earth; then came the morning star and the star sacred to Hermes, moving in orbits which have an equal swiftness with the sun, but in an opposite direction; and this is the reason why the sun and Hermes and Lucifer overtake and are overtaken by each other. To enumerate the places which he assigned to the other stars, and to give all the reasons why he assigned them, although a secondary matter, would give more trouble than the primary. These things at some future time, when we are at leisure, may have the consideration which they deserve, but not at present.

Now, when all the stars which were necessary to the creation of time had attained a motion suitable to them, and had become living creatures having bodies fastened by vital chains, and learnt their appointed task, moving in the motion of the diverse, which is diagonal, and passes through and is governed by the motion of the same, they revolved, some in a larger and some in a lesser orbit,—those which had the lesser orbit revolving faster, and those which had the larger more slowly. Now by reason of the motion of the same, those which revolved fastest appeared to be overtaken by those which moved slower although they really overtook them; for the motion of the same made them all turn in a spiral, and, because some went one way and some another, that which receded most slowly from the sphere of the same, which was the swiftest, appeared to follow it most nearly. That there might be some visible measure of their relative swiftness and slowness as they proceeded in their eight courses, God lighted a fire, which we now call the sun, in the second from the earth of these orbits, that it might give light to the whole of heaven, and that the animals, as many as nature intended, might participate in number, learning arithmetic from the revolution of the same and the like. Thus, then, and for this reason the night and the day were created, being the period of the one most intelligent revolution. And the month is accomplished when the moon has completed her orbit and overtaken the sun, and the year when the sun has completed his own orbit. Mankind, with hardly an exception, have not remarked the periods of the other stars, and they have no name for them, and do not measure them against one another by the help of number, and hence they can scarcely be said to know that their wanderings, being infinite in number and admirable for their variety, make up time. And yet there is no difficulty in seeing that the perfect number of time fulfils the perfect year when all the eight revolutions, having their relative degrees of swiftness, are accomplished together and attain their completion at the same time, measured by the rotation of the same and equally moving. After this manner, and for these reasons, came into being such of the stars as in their heavenly progress received reversals of motion, to the end that the created heaven might imitate the eternal nature, and be as like as possible to the perfect and intelligible animal.

Thus far and until the birth of time the created universe was made in the likeness of the original, but inasmuch as all animals were not yet comprehended therein, it was still unlike. What remained, the creator then proceeded to fashion after the nature of the pattern. Now as in the ideal animal the mind perceives ideas or species of a certain nature and number, he thought that this created animal ought to have species of a like nature and number. There are four such; one of them is the heavenly race of the gods; another, the race of birds whose way is in the air; the third, the watery species; and the fourth, the pedestrian and land creatures. Of the heavenly and divine, he created the greater part out of fire, that they might be the brightest of all things and fairest to behold, and he fashioned them after the likeness of the universe in the figure of a circle, and made them follow the intelligent motion of the supreme, distributing them over the whole circumference of heaven, which was to be a true cosmos or glorious world spangled with them all over. And he gave to each of them two movements: the first, a movement on the same spot after the same manner, whereby they ever continue to think the same thoughts about the same things; the second, a forward movement, in which they are controlled by the revolution of the same and the like; but by the other five motions they were unaffected, in order that each of them might attain the highest perfection. And for this reason the fixed stars were created, to be divine and animals, ever-abiding and revolving after the same manner and on the same spot; and the other stars which reverse their motion and are subject to deviations of this kind, were created in the manner already described. The earth, which is our nurse, clinging around the pole which is extended through the universe, he framed to be the guardian and artificer of night and day, first and eldest of gods that are in the interior of heaven. Vain would be the attempt to tell all the figures of them circling as in dance, and their juxtapositions, and the return of them in their revolutions upon themselves, and their approximations, and to say which of these deities in their conjunctions meet, and which of them are in opposition, and in what order they get behind and before one another, and when they are severally eclipsed to our sight and again reappear, sending terrors and intimations of the future to those who cannot calculate their movements—to attempt to tell of all this without a visible representation of the heavenly system would be labour in vain. Enough on this head; and now let what we have said about the nature of the created and visible gods have an end.

To know or tell the origin of the other divinities is beyond us, and we must accept the traditions of the men of old time who affirm themselves to be the offspring of the gods—that is what they say—and they must surely have known their own ancestors. How can we doubt the word of the children of the gods? Although they give no probable or certain proofs, still, as they declare that they are speaking of what took place in their own family, we must conform to custom and believe them. In this manner, then, according to them, the genealogy of these gods is to be received and set forth.

Oceanus and Tethys were the children of Earth and Heaven, and from these sprang Phorcys and Cronos and Rhea, and all that generation; and from Cronos and Rhea sprang Zeus and Herè, and all those who are said to be their brethren, and others who were the children of these. Now, when all of them, both those who visibly appear in their revolutions as well as those other gods who are of a more retiring nature, had come into being, the creator of the universe addressed them in these words: 'Gods, children of gods, who are my works, and of whom I am the artificer and father, my creations are indissoluble, if so I will. All that is bound may be undone, but only an evil being would wish to undo that which is harmonious and happy. Wherefore, since ye are but creatures, ye are not altogether immortal and indissoluble, but ye shall certainly not be dissolved, nor be liable to the fate of death, having in my will a greater and mightier bond than those with which ye were bound at the time of your birth. And now listen to my instructions:—Three tribes of mortal beings remain to be created—without them the universe will be incomplete, for it will not contain every kind of animal which it ought to contain, if it is to be perfect. On the other hand, if they were created by me and received life at my hands, they would be on an equality with the gods. In order then that they maybe mortal, and that this universe maybe truly universal, do ye, according to your natures, betake yourselves to the formation of animals, imitating the power which was shown by me in creating you. The part of them worthy of the name immortal, which is called divine and is the guiding principle of those who are willing to follow justice and you—of that divine part I will myself sow the seed, and having made a beginning, I will hand the work over to you. And do ye then interweave the mortal with the immortal, and make and beget living creatures, and give them food, and make them to grow, and receive them again in death.'

Thus he spake, and once more into the cup in which he had previously mingled the soul of the universe he poured the remains of the elements, and mingled them in much the same manner; they were not, however, pure as before, but diluted to the second and third degree. And having made it he divided the whole mixture into souls equal in number to the stars, and assigned each soul to a star; and having there placed them as in a chariot, he showed them the nature of the universe, and declared to them the laws of destiny, according to which their first birth would be one and the same for all,—no one should suffer a disadvantage at his hands; they were to be sown in the instruments of time severally adapted to them, and to come forth the most religious of animals; and as human nature was of two kinds, the superior race would hereafter be called man. Now, when they should be implanted in bodies by necessity, and be always gaining or losing some part of their bodily substance, then in the first place it would be necessary that they should all have in them one and the same faculty of sensation, arising out of irresistible impressions; in the second place, they must have love, in which pleasure and pain mingle; also fear and anger, and the feelings which are akin or opposite to them; if they conquered these they would live righteously, and if they were conquered by them, unrighteously. He who lived well during his appointed time was to return and dwell in his native star, and there he would have a blessed and congenial existence. But if he failed in attaining this, at the second birth he would pass into a woman, and if, when in that state of being, he did not desist from evil, he would continually be changed into some brute who resembled him in the evil nature which he had acquired, and would not cease from his toils and transformations until he followed the revolution of the same and the like within him, and overcame by the help of reason the turbulent and irrational mob of later accretions, made up of fire and air and water and earth, and returned to the form of his first and better state. Having given all these laws to his creatures, that he might be guiltless of future evil in any of them, the creator sowed some of them in the earth, and some in the moon, and some in the other instruments of time; and when he had sown them he committed to the younger gods the fashioning of their mortal bodies, and desired them to furnish what was still lacking to the human soul, and having made all the suitable additions, to rule over them, and to pilot the mortal animal in the best and wisest manner which they could, and avert from him all but self-inflicted evils.

When the creator had made all these ordinances he remained in his own accustomed nature, and his children heard and were obedient to their father’s word, and receiving from him the immortal principle of a mortal creature, in imitation of their own creator they borrowed portions of fire, and earth, and water, and air from the world, which were hereafter to be restored—these they took and welded them together, not with the indissoluble chains by which they were themselves bound, but with little pegs too small to be visible, making up out of all the four elements each separate body, and fastening the courses of the immortal soul in a body which was in a state of perpetual influx and efflux. Now these courses, detained as in a vast river, neither overcame nor were overcome; but were hurrying and hurried to and fro, so that the whole animal was moved and progressed, irregularly however and irrationally and anyhow, in all the six directions of motion, wandering backwards and forwards, and right and left, and up and down, and in all the six directions. For great as was the advancing and retiring flood which provided nourishment, the affections produced by external contact caused still greater tumult—when the body of any one met and came into collision with some external fire, or with the solid earth or the gliding waters, or was caught in the tempest borne on the air, and the motions produced by any of these impulses were carried through the body to the soul. All such motions have consequently received the general name of ‘sensations’ which they still retain. And they did in fact at that time create a very great and mighty movement; uniting with the ever-flowing stream in stirring up and violently shaking the courses of the soul, they completely stopped the revolution of the same by their opposing current, and hindered it from predominating and advancing; and they so disturbed the nature of the other or diverse, that the three double intervals [i.e. between 1, 2, 4, 8], and the three triple intervals [i.e. between 1, 3, 9, 27], together with the mean terms and connecting links which are expressed by the ratios of 3 : 2, and 4 : 3, and of 9 : 8,—these, although they cannot be wholly undone except by him who united them, were twisted by them in all sorts of ways, and the circles were broken and disordered in every possible manner, so that when they moved they were tumbling to pieces, and moved irrationally, at one time in a reverse direction, and then again obliquely, and then upside down, as you might imagine a person who is upside down and has his head leaning upon the ground and his feet up against something in the air; and when he is in such a position, both he and the spectator fancy that the right of either is his left, and the left right. If, when powerfully experiencing these and similar effects, the revolutions of the soul come in contact with some external thing, either of the class of the same or of the other, they speak of the same or of the other in a manner the very opposite of the truth; and they become false and foolish, and there is no course or revolution in them which has a guiding or directing power; and if again any sensations enter in violently from without and drag after them the whole vessel of the soul, then the courses of the soul, though they seem to conquer, are really conquered.

And by reason of all these affections, the soul, when encased in a mortal body, now, as in the beginning, is at first without intelligence; but when the flood of growth and nutriment abates, and the courses of the soul, calming down, go their own way and become steadier as time goes on, then the several circles return to their natural form, and their revolutions are corrected, and they call the same and the other by their right names, and make the possessor of them to become a rational being. And if these combine in him with any true nurture or education, he attains the fullness and health of the perfect man, and escapes the worst disease of all; but if he neglects education he walks lame to the end of his life, and returns imperfect and good for nothing to the world below. This, however, is a later stage; at present we must treat more exactly the subject before us, which involves a preliminary enquiry into the generation of the body and its members, and as to how the soul was created,—for what reason and by what providence of the gods; and holding fast to probability, we must pursue our way.

First, then, the gods, imitating the spherical shape of the universe, enclosed the two divine courses in a spherical body, that, namely, which we now term the head, being the most divine part of us and the lord of all that is in us: to this the gods, when they put together the body, gave all the other members to be servants, considering that it partook of every sort of motion. In order then that it might not tumble about among the high and deep places of the earth, but might be able to get over the one and out of the other, they provided the body to be its vehicle and means of locomotion; which consequently had length and was furnished with four limbs extended and flexible; these God contrived to be instruments of locomotion with which it might take hold and find support, and so be able to pass through all places, carrying on high the dwelling-place of the most sacred and divine part of us. Such was the origin of legs and hands, which for this reason were attached to every man; and the gods, deeming the front part of man to be more honourable and more fit to command than the hinder part, made us to move mostly in a forward direction. Wherefore man must needs have his front part unlike and distinguished from the rest of his body. And so in the vessel of the head, they first of all put a face in which they inserted organs to minister in all things to the providence of the soul, and they appointed this part, which has authority, to be by nature the part which is in front. And of the organs they first contrived the eyes to give light, and the principle according to which they were inserted was as follows: So much of fire as would not burn, but gave a gentle light, they formed into a substance akin to the light of every-day life; and the pure fire which is within us and related thereto they made to flow through the eyes in a stream smooth and dense, compressing the whole eye, and especially the centre part, so that it kept out everything of a coarser nature, and allowed to pass only this pure element. When the light of day surrounds the stream of vision, then like falls upon like, and they coalesce, and one body is formed by natural affinity in the line of vision, wherever the light that falls from within meets with an external object. And the whole stream of vision, being similarly affected in virtue of similarity, diffuses the motions of what it touches or what touches it over the whole body, until they reach the soul, causing that perception which we call sight. But when night comes on and the external and kindred fire departs, then the stream of vision is cut off; for going forth to an unlike element it is changed and extinguished, being no longer of one nature with the surrounding atmosphere which is now deprived of fire: and so the eye no longer sees, and we feel disposed to sleep. For when the eyelids, which the gods invented for the preservation of sight, are closed, they keep in the internal fire; and the power of the fire diffuses and equalizes the inward motions; when they are equalized, there is rest, and when the rest is profound, sleep comes over us scarce disturbed by dreams; but where the greater motions still remain, of whatever nature and in whatever locality, they engender corresponding visions in dreams, which are remembered by us when we are awake and in the external world. And now there is no longer any difficulty in understanding the creation of images in mirrors and all smooth and bright surfaces. For from the communion of the internal and external fires, and again from the union of them and their numerous transformations when they meet in the mirror, all these appearances of necessity arise, when the fire from the face coalesces with the fire from the eye on the bright and smooth surface. And right appears left and left right, because the visual rays come into contact with the rays emitted by the object in a manner contrary to the usual mode of meeting; but the right appears right, and the left left, when the position of one of the two concurring lights is reversed; and this happens when the mirror is concave and its smooth surface repels the right stream of vision to the left side, and the left to the right. Or if the mirror be turned vertically, then the concavity makes the countenance appear to be all upside down, and the lower rays are driven upwards and the upper downwards.

All these are to be reckoned among the second and cooperative causes which God, carrying into execution the idea of the best as far as possible, uses as his ministers. They are thought by most men not to be the second, but the prime causes of all things, because they freeze and heat, and contract and dilate, and the like. But they are not so, for they are incapable of reason or intellect; the only being which can properly have mind is the invisible soul, whereas fire and water, and earth and air, are all of them visible bodies. The lover of intellect and knowledge ought to explore causes of intelligent nature first of all, and, secondly, of those things which, being moved by others, are compelled to move others. And this is what we too must do.

Both kinds of causes should be acknowledged by us, but a distinction should be made between those which are endowed with mind and are the workers of things fair and good, and those which are deprived of intelligence and always produce chance effects without order or design. Of the second or co-operative causes of sight, which help to give to the eyes the power which they now possess, enough has been said. I will therefore now proceed to speak of the higher use and purpose for which God has given them to us. The sight in my opinion is the source of the greatest benefit to us, for had we never seen the stars, and the sun, and the heaven, none of the words which we have spoken about the universe would ever have been uttered. But now the sight of day and night, and the months and the revolutions of the years, have created number, and have given us a conception of time, and the power of enquiring about the nature of the universe; and from this source we have derived philosophy, than which no greater good ever was or will be given by the gods to mortal man. This is the greatest boon of sight: and of the lesser benefits why should I speak? even the ordinary man if he were deprived of them would bewail his loss, but in vain. Thus much let me say however: God invented and gave us sight to the end that we might behold the courses of intelligence in the heaven, and apply them to the courses of our own intelligence which are akin to them, the unperturbed to the perturbed; and that we, learning them and partaking of the natural truth of reason, might imitate the absolutely unerring courses of God and regulate our own vagaries. The same may be affirmed of speech and hearing: they have been given by the gods to the same end and for a like reason. For this is the principal end of speech, whereto it most contributes. Moreover, so much of music as is adapted to the sound of the voice and to the sense of hearing is granted to us for the sake of harmony; and harmony, which has motions akin to the revolutions of our souls, is not regarded by the intelligent votary of the Muses as given by them with a view to irrational pleasure, which is deemed to be the purpose of it in our day, but as meant to correct any discord which may have arisen in the courses of the soul, and to be our ally in bringing her into harmony and agreement with herself; and rhythm too was given by them for the same reason, on account of the irregular and graceless ways which prevail among mankind generally, and to help us against them.

Thus far in what we have been saying, with small exceptions, the works of intelligence have been set forth; and now we must place by the side of them in our discourse the things which come into being through necessity—for the creation is mixed, being made up of necessity and mind. Mind, the ruling power, persuaded necessity to bring the greater part of created things to perfection, and thus and after this manner in the beginning, when the influence of reason got the better of necessity, the universe was created. But if a person will truly tell of the way in which the work was accomplished, he must include the other influence of the variable cause as well. Wherefore, we must return again and find another suitable beginning, as about the former matters, so also about these. To which end we must consider the nature of fire, and water, and air, and earth, such as they were prior to the creation of the heaven, and what was happening to them in this previous state; for no one has as yet explained the manner of their generation, but we speak of fire and the rest of them, whatever they mean, as though men knew their natures, and we maintain them to be the first principles and letters or elements of the whole, when they cannot reasonably be compared by a man of any sense even to syllables or first compounds. And let me say thus much: I will not now speak of the first principle or principles of all things, or by whatever name they are to be called, for this reason,—because it is difficult to set forth my opinion according to the method of discussion which we are at present employing. Do not imagine, any more than I can bring myself to imagine, that I should be right in undertaking so great and difficult a task. Remembering what I said at first about probability, I will do my best to give as probable an explanation as any other,—or rather, more probable; and I will first go back to the beginning and try to speak of each thing and of all. Once more, then, at the commencement of my discourse, I call upon God, and beg him to be our saviour out of a strange and unwonted enquiry, and to bring us to the haven of probability. So now let us begin again.

This new beginning of our discussion of the universe requires a fuller division than the former; for then we made two classes, now a third must be revealed. The two sufficed for the former discussion: one, which we assumed, was a pattern intelligible and always the same; and the second was only the imitation of the pattern, generated and visible. There is also a third kind which we did not distinguish at the time, conceiving that the two would be enough. But now the argument seems to require that we should set forth in words another kind, which is difficult of explanation and dimly seen. What nature are we to attribute to this new kind of being? We reply, that it is the receptacle, and in a manner the nurse, of all generation. I have spoken the truth; but I must express myself in clearer language, and this will be an arduous task for many reasons, and in particular because I must first raise questions concerning fire and the other elements, and determine what each of them is; for to say, with any probability or certitude, which of them should be called water rather than fire, and which should be called any of them rather than all or some one of them, is a difficult matter. How, then, shall we settle this point, and what questions about the elements may be fairly raised?

In the first place, we see that what we just now called water, by condensation, I suppose, becomes stone and earth; and this same element, when melted and dispersed, passes into vapour and air. Air, again, when inflamed, becomes fire; and again fire, when condensed and extinguished, passes once more into the form of air; and once more, air, when collected and condensed, produces cloud and mist; and from these, when still more compressed, comes flowing water, and from water comes earth and stones once more; and thus generation appears to be transmitted from one to the other in a circle. Thus, then, as the several elements never present themselves in the same form, how can any one have the assurance to assert positively that any of them, whatever it may be, is one thing rather than another? No one can. But much the safest plan is to speak of them as follows:—Anything which we see to be continually changing, as, for example, fire, we must not call 'this' or 'that,' but rather say that it is 'of such a nature;' nor let us speak of water as 'this,' but always as 'such;' nor must we imply that there is any stability in any of those things which we indicate by the use of the words 'this' and 'that,' supposing ourselves to signify something thereby; for they are too volatile to be detained in any such expressions as 'this,' or 'that,' or 'relative to this,' or any other mode of speaking which represents them as permanent. We ought not to apply 'this' to any of them, but rather the word 'such;' which expresses the similar principle circulating in each and all of them; for example, that should be called 'fire' which is of such a nature always, and so of everything that has generation. That in which the elements severally grow up, and appear, and decay, is alone to be called by the name ‘this’ or ‘that;’ but that which is of a certain nature, hot or white, or anything which admits of opposite qualities, and all things that are compounded of them, ought not to be so denominated. Let me make another attempt to explain my meaning more clearly. Suppose a person to make all kinds of figures of gold and to be always transmuting one form into all the rest;—somebody points to one of them and asks what it is. By far the safest and truest answer is, That is gold; and not to call the triangle or any other figures which are formed in the gold ‘these,’ as though they had existence, since they are in process of change while he is making the assertion; but if the questioner be willing to take the safe and indefinite expression, ‘such,’ we should be satisfied. And the same argument applies to the universal nature which receives all bodies—that must be always called the same; for, while receiving all things, she never departs at all from her own nature, and never in any way, or at any time, assumes a form like that of any of the things which enter into her; she is the natural recipient of all impressions, and is stirred and informed by them, and appears different from time to time by reason of them. But the forms which enter into and go out of her are the likenesses of real existences modelled after their patterns in a wonderful and inexplicable manner, which we will hereafter investigate. For the present we have only to conceive of three natures: first, that which is in process of generation; secondly, that in which the generation takes place; and thirdly, that of which the thing generated is a resemblance. And we may liken the receiving principle to a mother, and the source or spring to a father, and the intermediate nature to a child; and may remark further, that if the model is to take every variety of form, then the matter in which the model is fashioned will not be duly prepared, unless it is formless, and free from the impress of any of those shapes which it is hereafter to receive from without. For if the matter were like any of the supervening forms, then whenever any opposite or entirely different nature was stamped upon its surface, it would take the impression badly, because it would intrude its own shape. Wherefore, that which is to receive all forms should have no form; as in making perfumes they first contrive that the liquid substance which is to receive the scent shall be as inodorous as possible; or as those who wish to impress figures on soft substances do not allow any previous impression to remain, but begin by making the surface as even and smooth as possible. In the same way that which is to receive perpetually and through its whole extent the resemblances of all eternal beings ought to be devoid of any particular form. Wherefore, the mother and receptacle of all created and visible and in any way sensible things, is not to be termed earth, or air, or fire, or water, or any of their compounds, or any of the elements from which these are derived, but is an invisible and formless being which receives all things and in some mysterious way partakes of the intelligible, and is most incomprehensible. In saying this we shall not be far wrong; as far, however, as we can attain to a knowledge of her from the previous considerations, we may truly say that fire is that part of her nature which from time to time is inflamed, and water that which is moistened, and that the mother substance becomes earth and air, in so far as she receives the impressions of them.

Let us consider this question more precisely. Is there any self-existent fire? and do all those things which we call self-existent exist? or are only those things which we see, or in some way perceive through the bodily organs, truly existent, and nothing whatever besides them? And is all that which we call an intelligible essence nothing at all, and only a name? Here is a question which we must not leave unexamined or undetermined, nor must we affirm too confidently that there can be no decision; neither must we interpolate in our present long discourse a digression equally long, but if it is possible to set forth a great principle in a few words, that is just what we want.

Thus I state my view:—If mind and true opinion are two distinct classes, then I say that there certainly are these self-existent ideas unperceived by sense, and apprehended only by the mind; if, however, as some say, true opinion differs in no respect from mind, then everything that we perceive through the body is to be regarded as most real and certain. But we must affirm them to be distinct, for they have a distinct origin and are of a different nature; the one is implanted in us by instruction, the other by persuasion; the one is always accompanied by true reason, the other is without reason; the one cannot be overcome by persuasion, but the other can: and lastly, every man may be said to share in true opinion, but mind is the attribute of the gods and of very few men. Wherefore also we must acknowledge that there is one kind of being which is always the same, uncreated and indestructible, never receiving anything into itself from without, nor itself going out to any other, but invisible and imperceptible by any sense, and of which the contemplation is granted to intelligence only. And there is another nature of the same name with it, and like to it, perceived by sense, created, always in motion, becoming in place and again vanishing out of place, which is apprehended by opinion and sense. And there is a third nature, which is space, and is eternal, and admits not of destruction and provides a home for all created things, and is apprehended without the help of sense, by a kind of spurious reason, and is hardly real; which we beholding as in a dream, say of all existence that it must of necessity be in some place and occupy a space, but that what is neither in heaven nor in earth has no existence. Of these and other things of the same kind, relating to the true and waking reality of nature, we have only this dreamlike sense, and we are unable to cast off sleep and determine the truth about them. For an image, since the reality, after which it is modelled, does not belong to it, and it exists ever as the fleeting shadow of some other, must be inferred to be in another [i.e. in space], grasping existence in some way or other, or it could not be at all. But true and exact reason, vindicating the nature of true being, maintains that while two things [i.e. the image and space] are different they cannot exist one of them in the other and so be one and also two at the same time.

Thus have I concisely given the result of my thoughts; and my verdict is that being and space and generation, these three, existed in their three ways before the heaven; and that the nurse of generation, moistened by water and inflamed by fire, and receiving the forms of earth and air, and experiencing all the affections which accompany these, presented a strange variety of appearances; and being full of powers which were neither similar nor equally balanced, was never in any part in a state of equipoise, but swaying unevenly hither and thither, was shaken by them, and by its motion again shook them; and the elements when moved were separated and carried continually, some one way, some another; as, when grain is shaken and winnowed by fans and other instruments used in the threshing of corn, the close and heavy particles are borne away and settle in one direction, and the loose and light particles in another. In this manner, the four kinds or elements were then shaken by the receiving vessel, which, moving like a winnowing machine, scattered far away from one another the elements most unlike, and forced the most similar elements into close contact. Wherefore also the various elements had different places before they were arranged so as to form the universe. At first, they were all without reason and measure. But when the world began to get into order, fire and water and earth and air had only certain faint traces of themselves, and were altogether such as everything might be expected to be in the absence of God; this, I say, was their nature at that time, and God fashioned them by form and number. Let it be consistently maintained by us in all that we say that God made them as far as possible the fairest and best, out of things which were not fair and good. And now I will endeavor to show you the disposition and generation of them by an unaccustomed argument, which I am compelled to use; but I believe that you will be able to follow me, for your education has made you familiar with the methods of science.

In the first place, then, as is evident to all, fire and earth and water and air are bodies. And every sort of body possesses solidity, and every solid must necessarily be contained in planes; and every plane rectilinear figure is composed of triangles: and all triangles are originally of two kinds, both of which are made up of one right and two are acute angles; one of them has at either end of the base the half of a divided right angle, having equal sides, while in the other the right angle is divided into unequal parts, having unequal sides. These, then, proceeding by a combination of probability with demonstration, we assume to be the original elements of fire and the other bodies; but the principles which are prior to these God only knows, and he of men who is the friend of God. And next we have to determine what are the four most beautiful bodies which are unlike one another, and of which some are capable of resolution into one another; for having discovered thus much, we shall know the true origin of earth and fire and of the proportionate and intermediate elements. And then we shall not be willing to allow that there are any distinct kinds of visible bodies fairer than these. Wherefore we must endeavor to construct the four forms of bodies which excel in beauty, and then we shall be able to say that we have sufficiently apprehended their nature. Now of the two triangles, the isosceles has one form only; the scalene or unequal-sided has an infinite number. Of the infinite forms we must select the most beautiful, if we are to proceed in due order, and any one who can point out a more beautiful form than ours for the construction of these bodies, shall carry off the palm, not as an enemy, but as a friend. Now, the one which we maintain to be the most beautiful of all the many triangles (and we need not speak of the others) is that of which the double forms a third triangle which is equilateral; the reason of this would be long to tell; he who disproves what we are saying, and shows that we are mistaken, may claim a friendly victory. Then let us choose two triangles, out of which fire and the other elements have been constructed, one isosceles, the other having the square of the longer side equal to three times the square of the lesser side.

Now is the time to explain what was before obscurely said: there was an error in imagining that all the four elements might be generated by and into one another; this, I say, was an erroneous supposition, for there are generated from the triangles which we have selected four kinds—three from the one which has the sides unequal; the fourth alone is framed out of the isosceles triangle. Hence they cannot all be resolved into one another, a great number of small bodies being combined into a few large ones, or the converse. But three of them can be thus resolved and compounded, for they all spring from one, and when the greater bodies are broken up, many small bodies will spring up out of them and take their own proper figures; or, again, when many small bodies are dissolved into their triangles, if they become one, they will form one large mass of another kind. So much for their passage into one another. I have now to speak of their several kinds, and show out of what combinations of numbers each of them was formed. The first be the simplest and smallest construction, and its element is that triangle which has its hypothenuse twice the lesser side. When two such triangles are joined at diagonal, and this is repeated three times, and the triangles rest their diagonals and shorter sides on the same point as a centre, a single equilateral triangle is formed out of six triangles; and four equilateral triangles, if put together, make out of every three plane angles one solid angle, being that which is nearest to the most obtuse of plane angles; and out of the combination of these four angles arises the first solid form which distributes into equal and similar parts the whole circle in which it is inscribed. The second species of solid is formed out of the same triangles, which unite as eight equilateral triangles and form one solid angle out of four plane angles, and out of six such angles the second body is completed. And the third body is made up of 120 triangular elements, forming twelve solid angles, each of them included in five plane equilateral triangles, having altogether twenty bases, each of which is an equilateral triangle. The one element [that is, the triangle which has its hypothenuse twice the lesser side] having generated these figures, generated no more; but the isosceles triangle produced the fourth elementary figure, which is compounded of four such triangles, joining their right angles in a centre, and forming one equilateral quadrangle. Six of these united form eight solid angles, each of which is made by the combination of three plane right angles; the figure of the body thus composed is a cube, having six plane quadrangular equilateral bases. There was yet a fifth combination which God used in the delineation of the universe.

Now, he who, duly reflecting on all this, enquires whether the worlds are to be regarded as indefinite or definite in number, will be of opinion that the notion of their indefiniteness is characteristic of a sadly indefinite and ignorant mind. He, however, who raises the question whether they are to be truly regarded as one or five, takes up a more reasonable position. Arguing from probabilities, I am of opinion that they are one; another, regarding the question from another point of view, will be of another mind. But, leaving this enquiry, let us proceed to distribute the elementary forms, which have now been created in idea, among the four elements.

To earth, then, let us assign the cubical form; for earth is the most immoveable of the four and the most plastic of all bodies, and that which has the most stable bases must of necessity be of such a nature. Now, of the triangles which we assumed at first, that which has two equal sides is by nature more firmly based than that which has unequal sides; and of the compound figures which are formed out of either, the plane equilateral quadrangle has necessarily a more stable basis than the equilateral triangle, both in the whole and in the parts. Wherefore, in assigning this figure to earth, we adhere to probability; and to water we assign that one of the remaining forms which is the least moveable; and the most moveable of them to fire; and to air that which is intermediate. Also we assign the smallest body to fire, and the greatest to water, and the intermediate in size to air; and, again, the acutest body to fire, and the next in acuteness to air, and the third to water. Of all these elements, that which has the fewest bases must necessarily be the most moveable, for it must be the acutest and most penetrating in every way, and also the lightest as being composed of the smallest number of similar particles: and the second body has similar properties in a second degree, and the third body in the third degree. Let it be agreed, then, both according to strict reason and according to probability, that the pyramid is the solid which is the original element and seed of fire; and let us assign the element which was next in the order of generation to air, and the third to water. We must imagine all these to be so small that no single particle of any of the four kinds is seen by us on account of their smallness: but when many of them are collected together their aggregates are seen. And the ratios of their numbers, motions, and other properties, everywhere God, as far as necessity allowed or gave consent, has exactly perfected, and harmonized in due proportion.

From all that we have just been saying about the elements or kinds, the most probable conclusion is as follows:—earth, when meeting with fire and dissolved by its sharpness, whether the dissolution take place in the fire itself or perhaps in some mass of air or water, is borne hither and thither, until its parts, meeting together and mutually harmonizing, again become earth; for they can never take any other form. But water, when divided by fire or by air, on re-forming, may become one part fire and two parts air; and a single volume of air divided becomes two of fire. Again, when a small body of fire is contained in a larger body of air or water or earth, and both are moving, and the fire struggling is overcome and broken up, then two volumes of fire form one volume of air; and when air is overcome and cut up into small pieces, two and a half parts of air are condensed into one part of water. Let us consider the matter in another way. When one of the other elements is fastened upon by fire, and is cut by the sharpness of its angles and sides, it coalesces with the fire, and then ceases to be cut by them any longer. For no element which is one and the same with itself can be changed by or change another of the same kind and in the same state. But so long as in the process of transition the weaker is fighting against the stronger, the dissolution continues. Again, when a few small particles, enclosed in many larger ones, are in process of decomposition and extinction, they only cease from their tendency to extinction when they consent to pass into the conquering nature, and fire becomes air and air water. But if bodies of another kind go and attack them [i.e. the small particles], the latter continue to be dissolved until, being completely forced back and dispersed, they make their escape to their own kindred, or else, being overcome and assimilated to the conquering power, they remain where they are and dwell with their victors, and from being many become one. And owing to these affections, all things are changing their place, for by the motion of the receiving vessel the bulk of each class is distributed into its proper place; but those things which become unlike themselves and like other things, are hurried by the shaking into the place of the things to which they grow like.

Now all unmixed and primary bodies are produced by such causes as these. As to the subordinate species which are included in the greater kinds, they are to be attributed to the varieties in the structure of the two original triangles. For either structure did not originally produce the triangle of one size only, but some larger and some smaller, and there are as many sizes as there are species of the four elements. Hence when they are mingled with themselves and with one another there is an endless variety of them, which those who would arrive at the probable truth of nature ought duly to consider.

Unless a person comes to an understanding about the nature and conditions of rest and motion, he will meet with many difficulties in the discussion which follows. Something has been said of this matter already, and something more remains to be said, which is, that motion never exists in what is uniform. For to conceive that anything can be moved without a mover is hard or indeed impossible, and equally impossible to conceive that there can be a mover unless there be something which can be moved;—motion cannot exist where either of these are wanting, and for these to be uniform is impossible; wherefore we must assign rest to uniformity and motion to the want of uniformity. Now inequality is the cause of the nature which is wanting in uniformity; and of this we have already described the origin. But there still remains the further point—why things when divided after their kinds do not cease to pass through one another and to change their place—which we will now proceed to explain. In the revolution of the universe are comprehended all the four elements, and this being circular and having a tendency to come together, compresses everything and will not allow any place to be left void. Wherefore, also, fire above all things penetrates everywhere, and air next, as being next in rarity of the elements; and the two other elements in like manner penetrate according to their degrees of rarity. For those things which are composed of the largest particles have the largest void left in their compositions, and those which are composed of the smallest particles have the least. And the contraction caused by the compression thrusts the smaller particles into the interstices of the larger. And thus, when the small parts are placed side by side with the larger, and the lesser divide the greater and the greater unite the lesser, all the elements are borne up and down and hither and thither towards their own places; for the change in the size of each changes its position in space. And these causes generate an inequality which is always maintained, and is continually creating a perpetual motion of the elements in all time.

In the next place we have to consider that there are divers kinds of fire. There are, for example, first, flame; and secondly, those emanations of flame which do not burn but only give light to the eyes; thirdly, the remains of fire, which are seen in red-hot embers after the flame has been extinguished. There are similar differences in the air; of which the brightest part is called the aether, and the most turbid sort mist and darkness; and there are various other nameless kinds which arise from the inequality of the triangles. Water, again, admits in the first place of a division into two kinds; the one liquid and the other fusile. The liquid kind is composed of the small and unequal particles of water; and moves itself and is moved by other bodies owing to the want of uniformity and the shape of its particles; whereas the fusile kind, being formed of large and uniform particles, is more stable than the other, and is heavy and compact by reason of its uniformity. But when fire gets in and dissolves the particles and destroys the uniformity, it has greater mobility, and becoming fluid is thrust forth by the neighbouring air and spreads upon the earth; and this dissolution of the solid masses is called melting, and their spreading out upon the earth flowing. Again, when the fire goes out of the fusile substance, it does not pass into a vacuum, but into the neighbouring air; and the air which is displaced forces together the liquid and still moveable mass into the place which was occupied by the fire, and unites it with itself. Thus compressed the mass resumes its equability, and is again at unity with itself, because the fire which was the author of the inequality has retreated; and this departure of the fire is called cooling, and the coming together which follows upon it is termed congealment. Of all the kinds termed fusile, that which is the densest and is formed out of the finest and most uniform parts is that most precious possession called gold, which is hardened by filtration through rock; this is unique in kind, and has both a glittering and a yellow colour. A shoot of gold, which is so dense as to be very hard, and takes a black colour, is termed adamant. There is also another kind which has parts nearly like gold, and of which there are several species; it is denser than gold, and it contains a small and fine portion of earth, and is therefore harder, yet also lighter because of the great interstices which it has within itself; and this substance, which is one of the bright and denser kinds of water, when solidified is called copper. There is an alloy of earth mingled with it, which, when the two parts grow old and are disunited, shows itself separately and is called rust. The remaining phenomena of the same kind there will be no difficulty in reasoning out by the method of probabilities. A man may sometimes set aside meditations about eternal things, and for recreation turn to consider the truths of generation which are probable only; he will thus gain a pleasure not to be repented of, and secure for himself while he lives a wise and moderate pastime. Let us grant ourselves this indulgence, and go through the probabilities relating to the same subjects which follow next in order.

Water which is mingled with fire, so much as is fine and liquid (being so called by reason of its motion and the way in which it rolls along the ground), and soft, because its bases give way and are less stable than those of earth, when separated from fire and air and isolated, becomes more uniform, and by their retirement is compressed into itself; and if the condensation be very great, the water above the earth becomes hail, but on the earth, ice; and that which is congealed in a less degree and is only half solid, when above the earth is called snow, and when upon the earth, and condensed from dew, hoar-frost. Then, again, there are the numerous kinds of water which have been mingled with one another, and are distilled through plants which grow in the earth; and this whole class is called by the name of juices or saps. The unequal admixture of these fluids creates a variety of species; most of them are nameless, but four which are of a fiery nature are clearly distinguished and have names. First, there is wine, which warms the soul as well as the body: secondly, there is the oily nature, which is smooth and divides the visual ray, and for this reason is bright and shining and of a glistening appearance, including pitch, the juice of the castor berry, oil itself, and other things of a like kind: thirdly, there is the class of substances which expand the contracted parts of the mouth, until they return to their natural state, and by reason of this property create sweetness;—these are included under the general name of honey: and, lastly, there is a frothy nature, which differs from all juices, having a burning quality which dissolves the flesh; it is called *opos* (a vegetable acid).

As to the kinds of earth, that which is filtered through water passes into stone in the following manner:—The water which mixes with the earth and is broken up in the process changes into air, and taking this form mounts into its own place. But as there is no surrounding vacuum it thrusts away the neighbouring air, and this being rendered heavy, and, when it is displaced, having been poured around the mass of earth, forcibly compresses it and drives it into the vacant space whence the new air had come up; and the earth when compressed by the air into an indissoluble union with water becomes rock. The fairer sort is that which is made up of equal and similar parts and is transparent; that which has the opposite qualities is inferior. But when all the watery part is suddenly drawn out by fire, a more brittle substance is formed, to which we give the name of pottery. Sometimes also moisture may remain, and the earth which has been fused by fire becomes, when cool, a certain stone of a black colour. A like separation of the water which had been copiously mingled with them may occur in two substances composed of finer particles of earth and of a briny nature; out of either of them a half-solid body is then formed, soluble in water—the one, soda, which is used for purging away oil and earth, the other, salt, which harmonizes so well in combinations pleasing to the palate, and is, as the law testifies, a substance dear to the gods. The compounds of earth and water are not soluble by water, but by fire only, and for this reason:—Neither fire nor air melt masses of earth; for their particles, being smaller than the interstices in its structure, have plenty of room to move without forcing their way, and so they leave the earth unmelted and undissolved; but particles of water, which are larger, force a passage, and dissolve and melt the earth. Wherefore earth when not consolidated by force is dissolved by water only; when consolidated, by nothing but fire; for this is the only body which can find an entrance. The cohesion of water again, when very strong, is dissolved by fire only—when weaker, then either by air or fire the former entering the interstices, and the latter penetrating even the triangles. But nothing can dissolve air, when strongly condensed, which does not reach the elements or triangles;

or if not strongly condensed, then only fire can dissolve it. As to bodies composed of earth and water, while the water occupies the vacant interstices of the earth in them which are compressed by force, the particles of water which approach them from without, finding no entrance, flow around the entire mass and leave it undissolved; but the particles of fire, entering into the interstices of the water, do to the water what water does to earth and fire to air, and are the sole causes of the compound body of earth and water liquefying and becoming fluid. Now these bodies are of two kinds; some of them, such as glass and the fusible sort of stones, have less water than they have earth; on the other hand, substances of the nature of wax and incense have more of water entering into their composition.

I have thus shown the various classes of bodies as they are diversified by their forms and combinations and changes into one another, and now I must endeavor to set forth their affections and the causes of them. In the first place, the bodies which I have been describing are necessarily objects of sense. But we have not yet considered the origin of flesh, or what belongs to flesh, or of that part of the soul which is mortal. And these things cannot be adequately explained without also explaining the affections which are concerned with sensation, nor the latter without the former: and yet to explain them together is hardly possible; for which reason we must assume first one or the other and afterwards examine the nature of our hypothesis. In order, then, that the affections may follow regularly after the elements, let us presuppose the existence of body and soul.

First, let us enquire what we mean by saying that fire is hot: and about this we may reason from the dividing or cutting power which it exercises on our bodies. We all of us feel that fire is sharp; and we may further consider the fineness of the sides, and the sharpness of the angles, and the smallness of the particles, and the swiftness of the motion;—all this makes the action of fire violent and sharp, so that it cuts whatever it meets. And we must not forget that the original figure of fire [i.e. the pyramid], more than any other form, has a dividing power which cuts our bodies into small pieces (κερματίζει), and thus naturally produces that affection which we call heat; and hence the origin of the name (θερμὸς, κέρμα). Now, the opposite of this is sufficiently manifest; nevertheless we will not fail to describe it. For the larger particles of moisture which surround the body, entering in and driving out the lesser, but not being able to take their places, compress the moist principle in us; and this from being unequal and disturbed, is forced by them into a state of rest, which is due to equability and compression. But things which are contracted contrary to nature are by nature at war, and force themselves apart; and to this war and convulsion the name of shivering and trembling is given; and the whole affection and the cause of the affection are both termed cold. That is called hard to which our flesh yields, and soft which yields to our flesh; and things are also termed hard and soft relatively to one another. That which yields has a small base; but that which rests on quadrangular bases is firmly posed and belongs to the class which offers the greatest resistance; so too does that which is the most compact and therefore most repellent. The nature of the light and the heavy will be best understood when examined in connexion with our notions of above and below; for it is quite a mistake to suppose that the universe is parted into two regions, separate from and opposite to each other, the one a lower to which all things tend which have any bulk, and an upper to which things only ascend against their will. For as the universe is in the form of a sphere, all the extremities, being equidistant from the centre, are equally extremities, and the centre, which is equidistant from them, is equally to be regarded as the opposite of them all. Such being the nature of the world, when a person says that any of these points is above or below, may he not be justly charged with using an improper expression? For the centre of the world cannot be rightly called either above or below, but is the centre and nothing else; and the circumference is not the centre, and has in no one part of itself a different relation to the centre from what it has in any of the opposite parts. Indeed, when it is in every direction similar, how can one rightly give to it names which imply opposition? For if there were any solid body in equipoise at the centre of the universe, there would be nothing to draw it to this extreme rather than to that, for they are all perfectly similar; and if a person were to go round the world in a circle, he would often, when standing at the antipodes of his former position, speak of the same point as above and below; for, as I was saying just now, to speak of the whole which is in the form of a globe as having one part above and another below is not like a sensible man. The reason why these names are used, and the circumstances under which they are ordinarily applied by us to the division of the heavens, may be elucidated by the following supposition:—If a person were to stand in that part of the universe which is the appointed place of fire, and where there is the great mass of fire to which fiery bodies gather—if, I say, he were to ascend thither, and, having the power to do this, were to abstract particles of fire and put them in scales and weigh them, and then, raising the balance, were to draw the fire by force towards the uncongenial element of the air, it would be very evident that he could compel the smaller mass more readily than the larger; for when two things are simultaneously raised by one and the same power, the smaller body must necessarily yield to the superior power with less reluctance than the larger; and the larger body is called heavy and said to tend downwards, and the smaller body is called light and said to tend upwards. And we may detect ourselves who are upon the earth doing precisely the same thing. For we often separate earthy natures, and sometimes earth itself, and draw them into the uncongenial element of air by force and contrary to nature, both clinging to their kindred elements. But that which is smaller yields to the impulse given by us towards the dissimilar element more easily than the larger; and so we call the former light, and the place towards which it is impelled we call above, and the contrary state and place we call heavy and below respectively. Now the relations of these must necessarily vary, because the principal masses of the different elements hold opposite positions; for that which is light, heavy, below or above in one place will be found to be and become contrary and transverse and everyway diverse in relation to that which is light, heavy, below or above in an opposite place.

And about all of them this has to be considered:—that the tendency of each towards its kindred element makes the body which is moved heavy, and the place towards which the motion tends below, but things which have an opposite tendency we call by an opposite name. Such are the causes which we assign to these phenomena. As to the smooth and the rough, any one who sees them can explain the reason of them to another. For roughness is hardness mingled with irregularity, and smoothness is produced by the joint effect of uniformity and density.

The most important of the affections which concern the whole body remains to be considered,—that is, the cause of pleasure and pain in the perceptions of which I have been speaking, and in all other things which are perceived by sense through the parts of the body, and have both pains and pleasures attendant on them. Let us imagine the causes of every affection, whether of sense or not, to be of the following nature, remembering that we have already distinguished between the nature which is easy and which is hard to move; for this is the direction in which we must hunt the prey which we mean to take. A body which is of a nature to be easily moved, on receiving an impression however slight, spreads abroad the motion in a circle, the parts communicating with each other, until at last, reaching the principle of mind, they announce the quality of the agent. But a body of the opposite kind, being immobile, and not extending to the surrounding region, merely receives the impression, and does not stir any of the neighbouring parts; and since the parts do not distribute the original impression to other parts, it has no effect of motion on the whole animal, and therefore produces no effect on the patient. This is true of the bones and hair and other more earthy parts of the human body; whereas what was said above relates mainly to sight and hearing, because they have in them the greatest amount of fire and air. Now we must conceive of pleasure and pain in this way. An impression produced in us contrary to nature and violent, if sudden, is painful; and, again, the sudden return to nature is pleasant; but a gentle and gradual return is imperceptible and vice versa. On the other hand the impression of sense which is most easily produced is most readily felt, but is not accompanied by pleasure or pain; such, for example, are the affections of the sight, which, as we said above, is a body naturally uniting with our body in the day-time; for cuttings and burnings and other affections which happen to the sight do not give pain, nor is there pleasure when the sight returns to its natural state; but the sensations are clearest and strongest according to the manner in which the eye is affected by the object, and itself strikes and touches it; there is no violence either in the contraction or dilation of the eye. But bodies formed of larger particles yield to the agent only with a struggle; and then they impart their motions to the whole and cause pleasure and pain—pain when alienated from their natural conditions, and pleasure when restored to them. Things which experience gradual withdrawings and emptyings of their nature, and great and sudden replenishments, fail to perceive the emptying, but are sensible of the replenishment; and so they occasion no pain, but the greatest pleasure, to the mortal part of the soul, as is manifest in the case of perfumes. But things which are changed all of a sudden, and only gradually and with difficulty return to their own nature, have effects in every way opposite to the former, as is evident in the case of burnings and cuttings of the body.

Thus have we discussed the general affections of the whole body, and the names of the agents which produce them. And now I will endeavor to speak of the affections of particular parts, and the causes and agents of them, as far as I am able. In the first place let us set forth what was omitted when we were speaking of juices, concerning the affections peculiar to the tongue. These too, like most of the other affections, appear to be caused by certain contractions and dilations, but they have besides more of roughness and smoothness than is found in other affections: for whenever earthy particles enter into the small veins which are the testing instruments of the tongue, reaching to the heart, and fall upon the moist, delicate portions of flesh—when, as they are dissolved, they contract and dry up the little veins, they are astringent if they are rougher, but if not so rough, then only harsh.

Those of them which are of an abstergent nature, and purge the whole surface of the tongue, if they do it in excess, and so encroach as to consume some part of the flesh itself, like potash and soda, are all termed bitter. But the particles which are deficient in the alkaline quality, and which cleanse only moderately, are called salt, and having no bitterness or roughness, are regarded as rather agreeable than otherwise. Bodies which share in and are made smooth by the heat of the mouth, and which are inflamed, and again in turn inflame that which heats them, and which are so light that they are carried upwards to the sensations of the head, and cut all that comes in their way, by reason of these qualities in them, are all termed pungent. But when these same particles, refined by putrefaction, enter into the narrow veins, and are duly proportioned to the particles of earth and air which are there, they set them whirling about one another, and while they are in a whirl cause them to dash against and enter into one another, and so form hollows surrounding the particles that enter—which watery vessels of air (for a film of moisture, sometimes earthy, sometimes pure, is spread around the air) are hollow spheres of water; and those of them which are pure, are transparent, and are called bubbles, while those composed of the earthy liquid, which is in a state of general agitation and effervescence, are said to boil or ferment;—of all these affections the cause is termed acid. And there is the opposite affection arising from an opposite cause, when the mass of entering particles, immersed in the moisture of the mouth, is congenial to the tongue, and smooths and oils over the roughness, and relaxes the parts which are unnaturally contracted, and contracts the parts which are relaxed, and disposes them all according to their nature;—that sort of remedy of violent affections is pleasant and agreeable to every man, and has the name sweet. But enough of this.

The faculty of smell does not admit of differences of kind; for all smells are of a half-formed nature, and no element is so proportioned as to have any smell. The veins about the nose are too narrow to admit earth and water, and too wide to detain fire and air; and for this reason no one ever perceives the smell of any of them; but smells always proceed from bodies that are damp, or putrefying, or liquefying, or evaporating, and are perceptible only in the intermediate state, when water is changing into air and air into water; and all of them are either vapour or mist. That which is passing out of air into water is mist, and that which is passing from water into air is vapour; and hence all smells are thinner than water and thicker than air. The proof of this is, that when there is any obstruction to the respiration, and a man draws in his breath by force, then no smell filters through, but the air without the smell alone penetrates. Wherefore the varieties of smell have no name, and they have not many, or definite and simple kinds; but they are distinguished only as painful and pleasant, the one sort irritating and disturbing the whole cavity which is situated between the head and the navel, the other having a soothing influence, and restoring this same region to an agreeable and natural condition.

In considering the third kind of sense, hearing, we must speak of the causes in which it originates. We may in general assume sound to be a blow which passes through the ears, and is transmitted by means of the air, the brain, and the blood, to the soul, and that hearing is the vibration of this blow, which begins in the head and ends in the region of the liver. The sound which moves swiftly is acute, and the sound which moves slowly is grave, and that which is regular is equable and smooth, and the reverse is harsh.

A great body of sound is loud, and a small body of sound the reverse. Respecting the harmonies of sound I must hereafter speak.

There is a fourth class of sensible things, having many intricate varieties, which must now be distinguished. They are called by the general name of colours, and are a flame which emanates from every sort of body, and has particles corresponding to the sense of sight. I have spoken already, in what has preceded, of the causes which generate sight, and in this place it will be natural and suitable to give a rational theory of colours.

Of the particles coming from other bodies which fall upon the sight, some are smaller and some are larger, and some are equal to the parts of the sight itself. Those which are equal are imperceptible, and we call them transparent. The larger produce contraction, the smaller dilation, in the sight, exercising a power akin to that of hot and cold bodies on the flesh, or of astringent bodies on the tongue, or of those heating bodies which we termed pungent. White and black are similar effects of contraction and dilation in another sphere, and for this reason have a different appearance. Wherefore, we ought to term white that which dilates the visual ray, and the opposite of this black. There is also a swifter motion of a different sort of fire which strikes and dilates the ray of sight until it reaches the eyes, forcing a way through their passages and melting them, and eliciting from them a union of fire and water which we call tears, being itself an opposite fire which comes to them from an opposite direction—the inner fire flashes forth like lightning, and the outer finds a way in and is extinguished in the moisture, and all sorts of colours are generated by the mixture. This affection is termed dazzling, and the object which produces it is called bright and flashing. There is another sort of fire which is intermediate, and which reaches and mingles with the moisture of the eye without flashing; and in this, the fire mingling with the ray of the moisture, produces a colour like blood, to which we give the name of red. A bright hue mingled with red and white gives the colour called auburn (ξανθόν). The law of proportion, however, according to which the several colours are formed, even if a man knew he would be foolish in telling, for he could not give any necessary reason, nor indeed any tolerable or probable explanation of them. Again, red, when mingled with black and white, becomes purple, but it becomes umber (ὄρφνινον) when the colours are burnt as well as mingled and the black is more thoroughly mixed with them. Flame-colour (πυρρὸν) is produced by a union of auburn and dun (φαιὸν), and dun by an admixture of black and white; pale yellow (ὠχρὸν), by an admixture of white and auburn. White and bright meeting, and falling upon a full black, become dark blue (κυανοῦν), and when dark blue mingles with white, a light blue (γλαυκὸν) colour is formed, as flame-colour with black makes leek green (πράσιον). There will be no difficulty in seeing how and by what mixtures the colours derived from these are made according to the rules of probability. He, however, who should attempt to verify all this by experiment, would forget the difference of the human and divine nature. For God only has the knowledge and also the power which are able to combine many things into one and again resolve the one into many. But no man either is or ever will be able to accomplish either the one or the other operation.

These are the elements, thus of necessity then subsisting, which the creator of the fairest and best of created things associated with himself, when he made the self-sufficing and most perfect God, using the necessary causes as his ministers in the accomplishment of his work, but himself contriving the good in all his creations. Wherefore we may distinguish two sorts of causes, the one divine and the other necessary, and may seek for the divine in all things, as far as our nature admits, with a view to the blessed life; but the necessary kind only for the sake of the divine, considering that without them and when isolated from them, these higher things for which we look cannot be apprehended or received or in any way shared by us.

Seeing, then, that we have now prepared for our use the various classes of causes which are the material out of which the remainder of our discourse must be woven, just as wood is the material of the carpenter, let us revert in a few words to the point at which we began, and then endeavor to add on a suitable ending to the beginning of our tale.

As I said at first, when all things were in disorder God created in each thing in relation to itself, and in all things in relation to each other, all the measures and harmonies which they could possibly receive. For in those days nothing had any proportion except by accident; nor did any of the things which now have names deserve to be named at all—as, for example, fire, water, and the rest of the elements. All these the creator first set in order, and out of them he constructed the universe, which was a single animal comprehending in itself all other animals, mortal and immortal. Now of the divine, he himself was the creator, but the creation of the mortal he committed to his offspring. And they, imitating him, received from him the immortal principle of the soul; and around this they proceeded to fashion a mortal body, and made it to be the vehicle of the soul, and constructed within the body a soul of another nature which was mortal, subject to terrible and irresistible affections,—first of all, pleasure, the greatest incitement to evil; then, pain, which deters from good; also rashness and fear, two foolish counsellors, anger hard to be appeased, and hope easily led astray;—these they mingled with irrational sense and with all-daring love according to necessary laws, and so framed man. Wherefore, fearing to pollute the divine any more than was absolutely unavoidable, they gave to the mortal nature a separate habitation in another part of the body, placing the neck between them to be the isthmus and boundary, which they constructed between the head and breast, to keep them apart. And in the breast, and in what is termed the thorax, they encased the mortal soul; and as the one part of this was superior and the other inferior they divided the cavity of the thorax into two parts, as the women's and men's apartments are divided in houses, and placed the midriff to be a wall of partition between them. That part of the inferior soul which is endowed with courage and passion and loves contention they settled nearer the head, midway between the midriff and the neck, in order that it might be under the rule of reason and might join with it in controlling and restraining the desires when they are no longer willing of their own accord to obey the word of command issuing from the citadel.

The heart, the knot of the veins and the fountain of the blood which races through all the limbs, was set in the place of guard, that when the might of passion was roused by reason making proclamation of any wrong assailing them from without or being perpetrated by the desires within, quickly the whole power of feeling in the body, perceiving these commands and threats, might obey and follow through every turn and alley, and thus allow the principle of the best to have the command in all of them. But the gods, foreknowing that the palpitation of the heart in the expectation of danger and the swelling and excitement of passion was caused by fire, formed and implanted as a supporter to the heart the lung, which was, in the first place, soft and bloodless, and also had within hollows like the pores of a sponge, in order that by receiving the breath and the drink, it might give coolness and the power of respiration and alleviate the heat. Wherefore they cut the air-channels leading to the lung, and placed the lung about the heart as a soft spring, that, when passion was rife within, the heart, beating against a yielding body, might be cooled and suffer less, and might thus become more ready to join with passion in the service of reason.

The part of the soul which desires meats and drinks and the other things of which it has need by reason of the bodily nature, they placed between the midriff and the boundary of the navel, contriving in all this region a sort of manger for the food of the body; and there they bound it down like a wild animal which was chained up with man, and must be nourished if man was to exist. They appointed this lower creation his place here in order that he might be always feeding at the manger, and have his dwelling as far as might be from the council-chamber, making as little noise and disturbance as possible, and permitting the best part to advise quietly for the good of the whole. And knowing that this lower principle in man would not comprehend reason, and even if attaining to some degree of perception would never naturally care for rational notions, but that it would be led away by phantoms and visions night and day,—to be a remedy for this, God combined with it the liver, and placed it in the house of the lower nature, contriving that it should be solid and smooth, and bright and sweet, and should also have a bitter quality, in order that the power of thought, which proceeds from the mind, might be reflected as in a mirror which receives likenesses of objects and gives back images of them to the sight; and so might strike terror into the desires, when, making use of the bitter part of the liver, to which it is akin, it comes threatening and invading, and diffusing this bitter element swiftly through the whole liver produces colours like bile, and contracting every part makes it wrinkled and rough; and twisting out of its right place and contorting the lobe and closing and shutting up the vessels and gates, causes pain and loathing. And the converse happens when some gentle inspiration of the understanding pictures images of an opposite character, and allays the bile and bitterness by refusing to stir or touch the nature opposed to itself, but by making use of the natural sweetness of the liver, corrects all things and makes them to be right and smooth and free, and renders the portion of the soul which resides about the liver happy and joyful, enabling it to pass the night in peace, and to practise divination in sleep, inasmuch as it has no share in mind and reason. For the authors of our being, remembering the command of their father when he bade them create the human race as good as they could, that they might correct our inferior parts and make them to attain a measure of truth, placed in the liver the seat of divination. And herein is a proof that God has given the art of divination not to the wisdom, but to the foolishness of man. No man, when in his wits, attains prophetic truth and inspiration; but when he receives the inspired word, either his intelligence is enthralled in sleep, or he is demented by some distemper or possession. And he who would understand what he remembers to have been said, whether in a dream or when he was awake, by the prophetic and inspired nature, or would determine by reason the meaning of the apparitions which he has seen, and what indications they afford to this man or that, of past, present or future good and evil, must first recover his wits. But, while he continues demented, he cannot judge of the visions which he sees or the words which he utters; the ancient saying is very true, that ‘only a man who has his wits can act or judge about himself and his own affairs’ And for this reason it is customary to appoint interpreters to be judges of the true inspiration. Some persons call them prophets; they are quite unaware that they are only the expositors of dark sayings and visions, and are not to be called prophets at all, but only interpreters of prophecy.

Such is the nature of the liver, which is placed as we have described in order that it may give prophetic intimations. During the life of each individual these intimations are plainer, but after his death the liver becomes blind, and delivers oracles too obscure to be intelligible. The neighbouring organ [the spleen] is situated on the left-hand side, and is constructed with a view of keeping the liver bright and pure,—like a napkin, always ready prepared and at hand to clean the mirror. And hence, when any impurities arise in the region of the liver by reason of disorders of the body, the loose nature of the spleen, which is composed of a hollow and bloodless tissue, receives them all and clears them away, and when filled with the unclean matter, swells and festers, but, again, when the body is purged, settles down into the same place as before, and is humbled.

Concerning the soul, as to which part is mortal and which divine, and how and why they are separated, and where located, if God acknowledges that we have spoken the truth, then, and then only, can we be confident; still, we may venture to assert that what has been said by us is probable, and will be rendered more probable by investigation. Let us assume thus much.

The creation of the rest of the body follows next in order, and this we may investigate in a similar manner. And it appears to be very meet that the body should be framed on the following principles:—

The authors of our race were aware that we should be intemperate in eating and drinking, and take a good deal more than was necessary or proper, by reason of gluttony. In order then that disease might not quickly destroy us, and lest our mortal race should perish without fulfilling its end—intending to provide against this, the gods made what is called the lower belly, to be a receptacle for the superfluous meat and drink, and formed the convolution of the bowels, so that the food might be prevented from passing quickly through and compelling the body to require more food, thus producing insatiable gluttony, and making the whole race an enemy to philosophy and music, and rebellious against the divinest element within us.

The bones and flesh, and other similar parts of us, were made as follows. The first principle of all of them was the generation of the marrow. For the bonds of life which unite the soul with the body are made fast there, and they are the root and foundation of the human race. The marrow itself is created out of other materials: God took such of the primary triangles as were straight and smooth, and were adapted by their perfection to produce fire and water, and air and earth—these, I say, he separated from their kinds, and mingling them in due proportions with one another, made the marrow out of them to be a universal seed of the whole race of mankind; and in this seed he then planted and enclosed the souls, and in the original distribution gave to the marrow as many and various forms as the different kinds of souls were hereafter to receive. That which, like a field, was to receive the divine seed, he made round every way, and called that portion of the marrow, brain, intending that, when an animal was perfected, the vessel containing this substance should be the head; but that which was intended to contain the remaining and mortal part of the soul he distributed into figures at once round and elongated, and he called them all by the name ‘marrow;’ and to these, as to anchors, fastening the bonds of the whole soul, he proceeded to fashion around them the entire framework of our body, constructing for the marrow, first of all, a complete covering of bone.

Bone was composed by him in the following manner. Having sifted pure and smooth earth he kneaded it and wetted it with marrow, and after that he put it into fire and then into water, and once more into fire and again into water—in this way by frequent transfers from one to the other he made it insoluble by either. Out of this he fashioned, as in a lathe, a globe made of bone, which he placed around the brain, and in this he left a narrow opening; and around the marrow of the neck and back he formed vertebrae which he placed under one another like pivots, beginning at the head and extending through the whole of the trunk. Thus wishing to preserve the entire seed, he enclosed it in a stone-like casing, inserting joints, and using in the formation of them the power of the other or diverse as an intermediate nature, that they might have motion and flexure. Then again, considering that the bone would be too brittle and inflexible, and when heated and again cooled would soon mortify and destroy the seed within—having this in view, he contrived the sinews and the flesh, that so binding all the members together by the sinews, which admitted of being stretched and relaxed about the vertebrae, he might thus make the body capable of flexion and extension, while the flesh would serve as a protection against the summer heat and against the winter cold, and also against falls, softly and easily yielding to external bodies, like articles made of felt; and containing in itself a warm moisture which in summer exudes and makes the surface damp, would impart a natural coolness to the whole body; and again in winter by the help of this internal warmth would form a very tolerable defence against the frost which surrounds it and attacks it from without. He who modelled us, considering these things, mixed earth with fire and water and blended them; and making a ferment of acid and salt, he mingled it with them and formed soft and succulent flesh.

As for the sinews, he made them of a mixture of bone and unfermented flesh, attempered so as to be in a mean, and gave them a yellow colour; wherefore the sinews have a firmer and more glutinous nature than flesh, but a softer and moister nature than the bones. With these God covered the bones and marrow, binding them together by sinews, and then enshrouded them all in an upper covering of flesh. The more living and sensitive of the bones he enclosed in the thinnest film of flesh, and those which had the least life within them in the thickest and most solid flesh. So again on the joints of the bones, where reason indicated that no more was required, he placed only a thin covering of flesh, that it might not interfere with the flexion of our bodies and make them unwieldy because difficult to move; and also that it might not, by being crowded and pressed and matted together, destroy sensation by reason of its hardness, and impair the memory and dull the edge of intelligence. Wherefore also the thighs and the shanks and the hips, and the bones of the arms and the forearms, and other parts which have no joints, and the inner bones, which on account of the rarity of the soul in the marrow are destitute of reason—all these are abundantly provided with flesh; but such as have mind in them are in general less fleshy, except where the creator has made some part solely of flesh in order to give sensation,—as, for example, the tongue. But commonly this is not the case. For the nature which comes into being and grows up in us by a law of necessity, does not admit of the combination of solid bone and much flesh with acute perceptions. More than any other part the framework of the head would have had them, if they could have co-existed, and the human race, having a strong and fleshy and sinewy head, would have had a life twice or many times as long as it now has, and also more healthy and free from pain. But our creators, considering whether they should make a longer-lived race which was worse, or a shorter-lived race which was better, came to the conclusion that every one ought to prefer a shorter span of life, which was better, to a longer one, which was worse; and therefore they covered the head with thin bone, but not with flesh and sinews, since it had no joints; and thus the head was added, having more wisdom and sensation than the rest of the body, but also being in every man far weaker. For these reasons and after this manner God placed the sinews at the extremity of the head, in a circle round the neck, and glued them together by the principle of likeness and fastened the extremities of the jawbones to them below the face, and the other sinews he dispersed throughout the body, fastening limb to limb. The framers of us framed the mouth, as now arranged, having teeth and tongue and lips, with a view to the necessary and the good, contriving the way in for necessary purposes, the way out for the best purposes; for that is necessary which enters in and gives food to the body; but the river of speech, which flows out of a man and ministers to the intelligence, is the fairest and noblest of all streams. Still the head could neither be left a bare frame of bones, on account of the extremes of heat and cold in the different seasons, nor yet be allowed to be wholly covered, and so become dull and senseless by reason of an overgrowth of flesh. The fleshy nature was not therefore wholly dried up, but a large sort of peel was parted off and remained over, which is now called the skin. This met and grew by the help of the cerebral moisture, and became the circular envelopment of the head. And the moisture, rising up under the sutures, watered and closed in the skin upon the crown, forming a sort of knot. The diversity of the sutures was caused by the power of the courses of the soul and of the food, and the more these struggled against one another the more numerous they became, and fewer if the struggle were less violent. This skin the divine power pierced all round with fire, and out of the punctures which were thus made the moisture issued forth, and the liquid and heat which was pure came away, and a mixed part which was composed of the same material as the skin, and had a fineness equal to the punctures, was borne up by its own impulse and extended far outside the head, but being too slow to escape, was thrust back by the external air, and rolled up underneath the skin, where it took root. Thus the hair sprang up in the skin, being akin to it because it is like threads of leather, but rendered harder and closer through the pressure of the cold, by which each hair, while in process of separation from the skin, is compressed and cooled. Wherefore the creator formed the head hairy, making use of the causes which I have mentioned, and reflecting also that instead of flesh the brain needed the hair to be a light covering or guard, which would give shade in summer and shelter in winter, and at the same time would not impede our quickness of perception. From the combination of sinew, skin, and bone, in the structure of the finger, there arises a triple compound, which, when dried up, takes the form of one hard skin partaking of all three natures, and was fabricated by these second causes, but designed by mind which is the principal cause with an eye to the future. For our creators well knew that women and other animals would some day be framed out of men, and they further knew that many animals would require the use of nails for many purposes; wherefore they fashioned in men at their first creation the rudiments of nails. For this purpose and for these reasons they caused skin, hair, and nails to grow at the extremities of the limbs.

And now that all the parts and members of the mortal animal had come together, since its life of necessity consisted of fire and breath, and it therefore wasted away by dissolution and depletion, the gods contrived the following remedy: They mingled a nature akin to that of man with other forms and perceptions, and thus created another kind of animal. These are the trees and plants and seeds which have been improved by cultivation and are now domesticated among us; anciently there were only the wild kinds, which are older than the cultivated. For everything that partakes of life may be truly called a living being, and the animal of which we are now speaking partakes of the third kind of soul, which is said to be seated between the midriff and the navel, having no part in opinion or reason or mind, but only in feelings of pleasure and pain and the desires which accompany them. For this nature is always in a passive state, revolving in and about itself, repelling the motion from without and using its own, and accordingly is not endowed by nature with the power of observing or reflecting on its own concerns. Wherefore it lives and does not differ from a living being, but is fixed and rooted in the same spot, having no power of self-motion.

Now after the superior powers had created all these natures to be food for us who are of the inferior nature, they cut various channels through the body as through a garden, that it might be watered as from a running stream. In the first place, they cut two hidden channels or veins down the back where the skin and the flesh join, which answered severally to the right and left side of the body. These they let down along the backbone, so as to have the marrow of generation between them, where it was most likely to flourish, and in order that the stream coming down from above might flow freely to the other parts, and equalize the irrigation. In the next place, they divided the veins about the head, and interlacing them, they sent them in opposite directions; those coming from the right side they sent to the left of the body, and those from the left they diverted towards the right, so that they and the skin might together form a bond which should fasten the head to the body, since the crown of the head was not encircled by sinews; and also in order that the sensations from both sides might be distributed over the whole body. And next, they ordered the water-courses of the body in a manner which I will describe, and which will be more easily understood if we begin by admitting that all things which have lesser parts retain the greater, but the greater cannot retain the lesser. Now of all natures fire has the smallest parts, and therefore penetrates through earth and water and air and their compounds, nor can anything hold it. And a similar principle applies to the human belly; for when meats and drinks enter it, it holds them, but it cannot hold air and fire, because the particles of which they consist are smaller than its own structure.

These elements, therefore, God employed for the sake of distributing moisture from the belly into the veins, weaving together a network of fire and air like a weel, having at the entrance two lesser weels; further he constructed one of these with two openings, and from the lesser weels he extended cords reaching all round to the extremities of the network. All the interior of the net he made of fire, but the lesser weels and their cavity, of air. The network he took and spread over the newly-formed animal in the following manner:—He let the lesser weels pass into the mouth; there were two of them, and one he let down by the air-pipes into the lungs, the other by the side of the air-pipes into the belly. The former he divided into two branches, both of which he made to meet at the channels of the nose, so that when the way through the mouth did not act, the streams of the mouth as well were replenished through the nose. With the other cavity (i.e. of the greater weel) he enveloped the hollow parts of the body, and at one time he made all this to flow into the lesser weels, quite gently, for they are composed of air, and at another time he caused the lesser weels to flow back again; and the net he made to find a way in and out through the pores of the body, and the rays of fire which are bound fast within followed the passage of the air either way, never at any time ceasing so long as the mortal being holds together. This process, as we affirm, the name-giver named inspiration and expiration. And all this movement, active as following well as passive, takes place in order that the body, being watered and cooled, may receive nourishment and life; for when the respiration is going in and out, and the fire, which is fast bound within, follows it, and ever and anon moving to and fro, enters through the belly and reaches the meat and drink, it dissolves them, and dividing them into small portions and guiding them through the passages where it goes, food and pumps them as from a fountain into the channels of the veins, and makes the stream of the veins flow through the body as through a conduit.

Let us once more consider the phenomena of respiration, and enquire into the causes which have made it what it is. They are as follows:—Seeing that there is no such thing as a vacuum into which any of those things which are moved can enter, and the breath is carried from us into the external air, the next point is, as will be clear to every one, that it does not go into a vacant space, but pushes its neighbour out of its place, and that which is thrust out in turn drives out its neighbour; and in this way everything of necessity at last comes round to that place from whence the breath came forth, and enters in there, and following the breath, fills up the vacant space; and this goes on like the rotation of a wheel, because there can be no such thing as a vacuum. Wherefore also the breast and the lungs, when they emit the breath, are replenished by the air which surrounds the body and which enters in through the pores of the flesh and is driven round in a circle; and again, the air which is sent away and passes out through the body forces the breath inwards through the passage of the mouth and the nostrils. Now the origin of this movement may be supposed to be as follows. In the interior of every animal the hottest part is that which is around the blood and veins; it is in a manner an internal fountain of fire, which we compare to the network of a creel, being woven all of fire and extended through the centre of the body, while the outer parts are composed of air. Now we must admit that heat naturally proceeds outward to its own place and to its kindred element; and as there are two exits for the heat, the one out through the body, and the other through the mouth and nostrils, when it moves towards the one, it drives round the air at the other, and that which is driven round falls into the fire and becomes warm, and that which goes forth is cooled. But when the heat changes its place, and the particles at the other exit grow warmer, the hotter air inclining in that direction and carried towards its native element, fire, pushes round the air at the other; and this being affected in the same way and communicating the same impulse, a circular motion swaying to and fro is produced by the double process, which we call inspiration and expiration.

The phenomena of medical cupping-glasses and of the swallowing of drink and of the projection of bodies, whether discharged in the air or bowled along the ground, are to be investigated on a similar principle; and swift and slow sounds, which appear to be high and low, and are sometimes discordant on account of their inequality, and then again harmonical on account of the equality of the motion which they excite in us. For when the motions of the antecedent swifter sounds begin to pause and the two are equalized, the slower sounds overtake the swifter and then propel them. When they overtake them they do not intrude a new and discordant motion, but introduce the beginnings of a slower, which answers to the swifter as it dies away, thus producing a single mixed expression out of high and low, whence arises a pleasure which even the unwise feel, and which to the wise becomes a higher sort of delight, being an imitation of divine harmony in mortal motions. Moreover, as to the flowing of water, the fall of the thunderbolt, and the marvels that are observed about the attraction of amber and the Heraclean stones,—in none of these cases is there any attraction; but he who investigates rightly, will find that such wonderful phenomena are attributable to the combination of certain conditions,—the non-existence of a vacuum, the fact that objects push one another round, and that they change places, passing severally into their proper positions as they are divided or combined.

Such, as we have seen, is the nature and such are the causes of respiration,—the subject in which this discussion originated. For the fire cuts the food and following the breath surges up within, fire and breath rising together and filling the veins by drawing up out of the belly and pouring into them the cut portions of the food; and so the streams of food are kept flowing through the whole body in all animals. And fresh cuttings from kindred substances, whether the fruits of the earth or herb of the field, which God planted to be our daily food, acquire all sorts of colours by their intermixture; but red is the most pervading of them, being created by the cutting action of fire and by the impression which it makes on a moist substance; and hence the liquid which circulates in the body has a colour such as we have described. The liquid itself we call blood, which nourishes the flesh and the whole body, whence all parts are watered and empty places filled.

Now the process of repletion and evacuation is effected after the manner of the universal motion by which all kindred substances are drawn towards one another. For the external elements which surround us are always causing us to consume away, and distributing and sending off like to like; the particles of blood, too, which are divided and contained within the frame of the animal as in a sort of heaven, are compelled to imitate the motion of the universe. Each, therefore, of the divided parts within us, being carried to its kindred nature, replenishes the void. When more is taken away than flows in, then we decay, and when less, we grow and increase.

The frame of the entire creature when young has the triangles of each kind new, and may be compared to the keel of a vessel which is just off the stocks; they are locked firmly together and yet the whole mass is soft and delicate, being freshly formed of marrow and nurtured on milk. Now when the triangles out of which meats and drinks are composed come in from without, and are comprehended in the body, being older and weaker than the triangles already there, the frame of the body gets the better of them and its newer triangles cut them up, and so the animal grows great, being nourished by a multitude of similar particles. But when the roots of the triangles are loosened by having undergone many conflicts with many things in the course of time, they are no longer able to cut or assimilate the food which enters, but are themselves easily divided by the bodies which come in from without. In this way every animal is overcome and decays, and this affection is called old age. And at last, when the bonds by which the triangles of the marrow are united no longer hold, and are parted by the strain of existence, they in turn loosen the bonds of the soul, and she, obtaining a natural release, flies away with joy. For that which takes place according to nature is pleasant, but that which is contrary to nature is painful. And thus death, if caused by disease or produced by wounds, is painful and violent; but that sort of death which comes with old age and fulfils the debt of nature is the easiest of deaths, and is accompanied with pleasure rather than with pain.

Now every one can see whence diseases arise. There are four natures out of which the body is compacted, earth and fire and water and air, and the unnatural excess or defect of these, or the change of any of them from its own natural place into another, or—since there are more kinds than one of fire and of the other elements—the assumption by any of these of a wrong kind, or any similar irregularity, produces disorders and diseases; for when any of them is produced or changed in a manner contrary to nature, the parts which were previously cool grow warm, and those which were dry become moist, and the light become heavy, and the heavy light; all sorts of changes occur. For, as we affirm, a thing can only remain the same with itself, whole and sound, when the same is added to it, or subtracted from it, in the same respect and in the same manner and in due proportion; and whatever comes or goes away in violation of these laws causes all manner of changes and infinite diseases and corruptions. Now there is a second class of structures which are also natural, and this affords a second opportunity of observing diseases to him who would understand them. For whereas marrow and bone and flesh and sinews are composed of the four elements, and the blood, though after another manner, is likewise formed out of them, most diseases originate in the way which I have described; but the worst of all owe their severity to the fact that the generation of these substances proceeds in a wrong order; they are then destroyed. For the natural order is that the flesh and sinews should be made of blood, the sinews out of the fibres to which they are akin, and the flesh out of the clots which are formed when the fibres are separated. And the glutinous and rich matter which comes away from the sinews and the flesh, not only glues the flesh to the bones, but nourishes and imparts growth to the bone which surrounds the marrow; and by reason of the solidity of the bones, that which filters through consists of the purest and smoothest and oiliest sort of triangles, dropping like dew from the bones and watering the marrow. Now when each process takes place in this order, health commonly results; when in the opposite order, disease. For when the flesh becomes decomposed and sends back the wasting substance into the veins, then an oversupply of blood of diverse kinds, mingling with air in the veins, having variegated colours and bitter properties, as well as acid and saline qualities, contains all sorts of bile and serum and phlegm. For all things go the wrong way, and having become corrupted, first they taint the blood itself, and then ceasing to give nourishment to the body they are carried along the veins in all directions, no longer preserving the order of their natural courses, but at war with themselves, because they receive no good from one another, and are hostile to the abiding constitution of the body, which they corrupt and dissolve. The oldest part of the flesh which is corrupted, being hard to decompose, from long burning grows black, and from being everywhere corroded becomes bitter, and is injurious to every part of the body which is still uncorrupted. Sometimes, when the bitter element is refined away, the black part assumes an acidity which takes the place of the bitterness; at other times the bitterness being tinged with blood has a redder colour; and this, when mixed with black, takes the hue of grass; and again, an auburn colour mingles with the bitter matter when new flesh is decomposed by the fire which surrounds the internal flame;—to all which symptoms some physician perhaps, or rather some philosopher, who had the power of seeing in many dissimilar things one nature deserving of a name, has assigned the common name of bile. But the other kinds of bile are variously distinguished by their colours. As for serum, that sort which is the watery part of blood is innocent, but that which is a secretion of black and acid bile is malignant when mingled by the power of heat with any salt substance, and is then called acid phlegm. Again, the substance which is formed by the liquefaction of new and tender flesh when air is present, if inflated and encased in liquid so as to form bubbles, which separately are invisible owing to their small size, but when collected are of a bulk which is visible, and have a white colour arising out of the generation of foam—all this decomposition of tender flesh when intermingled with air is termed by us white phlegm. And the whey or sediment of newly-formed phlegm is sweat and tears, and includes the various daily discharges by which the body is purified. Now all these become causes of disease when the blood is not replenished in a natural manner by food and drink but gains bulk from opposite sources in violation of the laws of nature. When the several parts of the flesh are separated by disease, if the foundation remains, the power of the disorder is only half as great, and there is still a prospect of an easy recovery; but when that which binds the flesh to the bones is diseased, and no longer being separated from the muscles and sinews, ceases to give nourishment to the bone and to unite flesh and bone, and from being oily and smooth and glutinous becomes rough and salt and dry, owing to bad regimen, then all the substance thus corrupted crumbles away under the flesh and the sinews, and separates from the bone, and the fleshy parts fall away from their foundation and leave the sinews bare and full of brine, and the flesh again gets into the circulation of the blood and makes the previously-mentioned disorders still greater. And if these bodily affections be severe, still worse are the prior disorders; as when the bone itself, by reason of the density of the flesh, does not obtain sufficient air, but becomes mouldy and hot and gangrened and receives no nutriment, and the natural process is inverted, and the bone crumbling passes into the food, and the food into the flesh, and the flesh again falling into the blood makes all maladies that may occur more virulent than those already mentioned. But the worst case of all is when the marrow is diseased, either from excess or defect; and this is the cause of the very greatest and most fatal disorders, in which the whole course of the body is reversed.

There is a third class of diseases which may be conceived of as arising in three ways; for they are produced sometimes by wind, and sometimes by phlegm, and sometimes by bile. When the lung, which is the dispenser of the air to the body, is obstructed by rheums and its passages are not free, some of them not acting, while through others too much air enters, then the parts which are unrefreshed by air corrode, while in other parts the excess of air forcing its way through the veins distorts them and decomposing the body is enclosed in the midst of it and occupies the midriff; thus numberless painful diseases are produced, accompanied by copious sweats. And oftentimes when the flesh is dissolved in the body, wind, generated within and unable to escape, is the source of quite as much pain as the air coming in from without; but the greatest pain is felt when the wind gets about the sinews and the veins of the shoulders, and swells them up, and so twists back the great tendons and the sinews which are connected with them. These disorders are called tetanus and opisthotonus, by reason of the tension which accompanies them. The cure of them is difficult; relief is in most cases given by fever supervening. The white phlegm, though dangerous when detained within by reason of the air-bubbles, yet if it can communicate with the outside air, is less severe, and only discolours the body, generating leprous eruptions and similar diseases. When it is mingled with black bile and dispersed about the courses of the head, which are the divinest part of us, the attack if coming on in sleep, is not so severe; but when assailing those who are awake it is hard to be got rid of, and being an affection of a sacred part, is most justly called sacred. An acid and salt phlegm, again, is the source of all those diseases which take the form of catarrh, but they have many names because the places into which they flow are manifold.

Inflammations of the body come from burnings and inflamings, and all of them originate in bile. When bile finds a means of discharge, it boils up and sends forth all sorts of tumours; but when imprisoned within, it generates many inflammatory diseases, above all when mingled with pure blood; since it then displaces the fibres which are scattered about in the blood and are designed to maintain the balance of rare and dense, in order that the blood may not be so liquefied by heat as to exude from the pores of the body, nor again become too dense and thus find a difficulty in circulating through the veins. The fibres are so constituted as to maintain this balance; and if any one brings them all together when the blood is dead and in process of cooling, then the blood which remains becomes fluid, but if they are left alone, they soon congeal by reason of the surrounding cold. The fibres having this power over the blood, bile, which is only stale blood, and which from being flesh is dissolved again into blood, at the first influx coming in little by little, hot and liquid, is congealed by the power of the fibres; and so congealing and made to cool, it produces internal cold and shuddering. When it enters with more of a flood and overcomes the fibres by its heat, and boiling up throws them into disorder, if it have power enough to maintain its supremacy, it penetrates the marrow and burns up what may be termed the cables of the soul, and sets her free; but when there is not so much of it, and the body though wasted still holds out, the bile is itself mastered, and is either utterly banished, or is thrust through the veins into the lower or upper belly, and is driven out of the body like an exile from a state in which there has been civil war; whence arise diarrhoeas and dysenteries, and all such disorders. When the constitution is disordered by excess of fire, continuous heat and fever are the result; when excess of air is the cause, then the fever is quotidian; when of water, which is a more sluggish element than either fire or air, then the fever is a tertian; when of earth, which is the most sluggish of the four, and is only purged away in a four-fold period, the result is a quartan fever, which can with difficulty be shaken off.

Such is the manner in which diseases of the body arise; the disorders of the soul, which depend upon the body, originate as follows. We must acknowledge disease of the mind to be a want of intelligence; and of this there are two kinds; to wit, madness and ignorance. In whatever state a man experiences either of them, that state may be called disease; and excessive pains and pleasures are justly to be regarded as the greatest diseases to which the soul is liable. For a man who is in great joy or in great pain, in his unseasonable eagerness to attain the one and to avoid the other, is not able to see or to hear anything rightly; but he is mad, and is at the time utterly incapable of any participation in reason. He who has the seed about the spinal marrow too plentiful and overflowing, like a tree overladen with fruit, has many throes, and also obtains many pleasures in his desires and their offspring, and is for the most part of his life deranged, because his pleasures and pains are so very great; his soul is rendered foolish and disordered by his body; yet he is regarded not as one diseased, but as one who is voluntarily bad, which is a mistake. The truth is that the intemperance of love is a disease of the soul due chiefly to the moisture and fluidity which is produced in one of the elements by the loose consistency of the bones. And in general, all that which is termed the incontinence of pleasure and is deemed a reproach under the idea that the wicked voluntarily do wrong is not justly a matter for reproach. For no man is voluntarily bad; but the bad become bad by reason of an ill disposition of the body and bad education, things which are hateful to every man and happen to him against his will. And in the case of pain too in like manner the soul suffers much evil from the body. For where the acid and briny phlegm and other bitter and bilious humours wander about in the body, and find no exit or escape, but are pent up within and mingle their own vapours with the motions of the soul, and are blended with them, they produce all sorts of diseases, more or fewer, and in every degree of intensity; and being carried to the three places of the soul, whichever they may severally assail, they create infinite varieties of ill-temper and melancholy, of rashness and cowardice, and also of forgetfulness and stupidity. Further, when to this evil constitution of body evil forms of government are added and evil discourses are uttered in private as well as in public, and no sort of instruction is given in youth to cure these evils, then all of us who are bad become bad from two causes which are entirely beyond our control. In such cases the planters are to blame rather than the plants, the educators rather than the educated. But however that may be, we should endeavor as far as we can by education, and studies, and learning, to avoid vice and attain virtue; this, however, is part of another subject.

There is a corresponding enquiry concerning the mode of treatment by which the mind and the body are to be preserved, about which it is meet and right that I should say a word in turn; for it is more our duty to speak of the good than of the evil. Everything that is good is fair, and the fair is not without proportion, and the animal which is to be fair must have due proportion. Now we perceive lesser symmetries or proportions and reason about them, but of the highest and greatest we take no heed; for there is no proportion or disproportion more productive of health and disease, and virtue and vice, than that between soul and body. This however we do not perceive, nor do we reflect that when a weak or small frame is the vehicle of a great and mighty soul, or conversely, when a little soul is encased in a large body, then the whole animal is not fair, for it lacks the most important of all symmetries; but the due proportion of mind and body is the fairest and loveliest of all sights to him who has the seeing eye. Just as a body which has a leg too long, or which is unsymmetrical in some other respect, is an unpleasant sight, and also, when doing its share of work, is much distressed and makes convulsive efforts, and often stumbles through awkwardness, and is the cause of infinite evil to its own self—in like manner we should conceive of the double nature which we call the living being; and when in this compound there is an impassioned soul more powerful than the body, that soul, I say, convulses and fills with disorders the whole inner nature of man; and when eager in the pursuit of some sort of learning or study, causes wasting; or again, when teaching or disputing in private or in public, and strifes and controversies arise, inflames and dissolves the composite frame of man and introduces rheums; and the nature of this phenomenon is not understood by most professors of medicine, who ascribe it to the opposite of the real cause. And once more, when a body large and too strong for the soul is united to a small and weak intelligence, then inasmuch as there are two desires natural to man,—one of food for the sake of the body, and one of wisdom for the sake of the diviner part of us—then, I say, the motions of the stronger, getting the better and increasing their own power, but making the soul dull, and stupid, and forgetful, engender ignorance, which is the greatest of diseases. There is one protection against both kinds of disproportion:—that we should not move the body without the soul or the soul without the body, and thus they will be on their guard against each other, and be healthy and well balanced. And therefore the mathematician or any one else whose thoughts are much absorbed in some intellectual pursuit, must allow his body also to have due exercise, and practise gymnastic; and he who is careful to fashion the body, should in turn impart to the soul its proper motions, and should cultivate music and all philosophy, if he would deserve to be called truly fair and truly good. And the separate parts should be treated in the same manner, in imitation of the pattern of the universe; for as the body is heated and also cooled within by the elements which enter into it, and is again dried up and moistened by external things, and experiences these and the like affections from both kinds of motions, the result is that the body if given up to motion when in a state of quiescence is overmastered and perishes; but if any one, in imitation of that which we call the foster-mother and nurse of the universe, will not allow the body ever to be inactive, but is always producing motions and agitations through its whole extent, which form the natural defence against other motions both internal and external, and by moderate exercise reduces to order according to their affinities the particles and affections which are wandering about the body, as we have already said when speaking of the universe, he will not allow enemy placed by the side of enemy to stir up wars and disorders in the body, but he will place friend by the side of friend, so as to create health. Now of all motions that is the best which is produced in a thing by itself, for it is most akin to the motion of thought and of the universe; but that motion which is caused by others is not so good, and worst of all is that which moves the body, when at rest, in parts only and by some external agency. Wherefore of all modes of purifying and re-uniting the body the best is gymnastic; the next best is a surging motion, as in sailing or any other mode of conveyance which is not fatiguing; the third sort of motion may be of use in a case of extreme necessity, but in any other will be adopted by no man of sense: I mean the purgative treatment of physicians; for diseases unless they are very dangerous should not be irritated by medicines, since every form of disease is in a manner akin to the living being, whose complex frame has an appointed term of life. For not the whole race only, but each individual—barring inevitable accidents—comes into the world having a fixed span, and the triangles in us are originally framed with power to last for a certain time, beyond which no man can prolong his life. And this holds also of the constitution of diseases; if any one regardless of the appointed time tries to subdue them by medicine, he only aggravates and multiplies them. Wherefore we ought always to manage them by regimen, as far as a man can spare the time, and not provoke a disagreeable enemy by medicines.

Enough of the composite animal, and of the body which is a part of him, and of the manner in which a man may train and be trained by himself so as to live most according to reason: and we must above and before all provide that the element which is to train him shall be the fairest and best adapted to that purpose. A minute discussion of this subject would be a serious task; but if, as before, I am to give only an outline, the subject may not unfitly be summed up as follows.

I have often remarked that there are three kinds of soul located within us, having each of them motions, and I must now repeat in the fewest words possible, that one part, if remaining inactive and ceasing from its natural motion, must necessarily become very weak, but that which is trained and exercised, very strong. Wherefore we should take care that the movements of the different parts of the soul should be in due proportion.

And we should consider that God gave the sovereign part of the human soul to be the divinity of each one, being that part which, as we say, dwells at the top of the body, and inasmuch as we are a plant not of an earthly but of a heavenly growth, raises us from earth to our kindred who are in heaven. And in this we say truly; for the divine power suspended the head and root of us from that place where the generation of the soul first began, and thus made the whole body upright. When a man is always occupied with the cravings of desire and ambition, and is eagerly striving to satisfy them, all his thoughts must be mortal, and, as far as it is possible altogether to become such, he must be mortal every whit, because he has cherished his mortal part. But he who has been earnest in the love of knowledge and of true wisdom, and has exercised his intellect more than any other part of him, must have thoughts immortal and divine, if he attain truth, and in so far as human nature is capable of sharing in immortality, he must altogether be immortal; and since he is ever cherishing the divine power, and has the divinity within him in perfect order, he will be perfectly happy. Now there is only one way of taking care of things, and this is to give to each the food and motion which are natural to it. And the motions which are naturally akin to the divine principle within us are the thoughts and revolutions of the universe. These each man should follow, and correct the courses of the head which were corrupted at our birth, and by learning the harmonies and revolutions of the universe, should assimilate the thinking being to the thought, renewing his original nature, and having assimilated them should attain to that perfect life which the gods have set before mankind, both for the present and the future.

Thus our original design of discoursing about the universe down to the creation of man is nearly completed. A brief mention may be made of the generation of other animals, so far as the subject admits of brevity; in this manner our argument will best attain a due proportion. On the subject of animals, then, the following remarks may be offered. Of the men who came into the world, those who were cowards or led unrighteous lives may with reason be supposed to have changed into the nature of women in the second generation.

And this was the reason why at that time the gods created in us the desire of sexual intercourse, contriving in man one animated substance, and in woman another, which they formed respectively in the following manner. The outlet for drink by which liquids pass through the lung under the kidneys and into the bladder, which receives and then by the pressure of the air emits them, was so fashioned by them as to penetrate also into the body of the marrow, which passes from the head along the neck and through the back, and which in the preceding discourse we have named the seed. And the seed having life, and becoming endowed with respiration, produces in that part in which it respires a lively desire of emission, and thus creates in us the love of procreation. Wherefore also in men the organ of generation becoming rebellious and masterful, like an animal disobedient to reason, and maddened with the sting of lust, seeks to gain absolute sway; and the same is the case with the so-called womb or matrix of women; the animal within them is desirous of procreating children, and when remaining unfruitful long beyond its proper time, gets discontented and angry, and wandering in every direction through the body, closes up the passages of the breath, and, by obstructing respiration, drives them to extremity, causing all varieties of disease, until at length the desire and love of the man and the woman, bringing them together and as it were plucking the fruit from the tree, sow in the womb, as in a field, animals unseen by reason of their smallness and without form; these again are separated and matured within; they are then finally brought out into the light, and thus the generation of animals is completed.

Thus were created women and the female sex in general. But the race of birds was created out of innocent light-minded men, who, although their minds were directed toward heaven, imagined, in their simplicity, that the clearest demonstration of the things above was to be obtained by sight; these were remodelled and transformed into birds, and they grew feathers instead of hair. The race of wild pedestrian animals, again, came from those who had no philosophy in any of their thoughts, and never considered at all about the nature of the heavens, because they had ceased to use the courses of the head, but followed the guidance of those parts of the soul which are in the breast. In consequence of these habits of theirs they had their front-legs and their heads resting upon the earth to which they were drawn by natural affinity; and the crowns of their heads were elongated and of all sorts of shapes, into which the courses of the soul were crushed by reason of disuse. And this was the reason why they were created quadrupeds and polypods: God gave the more senseless of them the more support that they might be more attracted to the earth. And the most foolish of them, who trail their bodies entirely upon the ground and have no longer any need of feet, he made without feet to crawl upon the earth. The fourth class were the inhabitants of the water: these were made out of the most entirely senseless and ignorant of all, whom the transformers did not think any longer worthy of pure respiration, because they possessed a soul which was made impure by all sorts of transgression; and instead of the subtle and pure medium of air, they gave them the deep and muddy sea to be their element of respiration; and hence arose the race of fishes and oysters, and other aquatic animals, which have received the most remote habitations as a punishment of their outlandish ignorance. These are the laws by which animals pass into one another, now, as ever, changing as they lose or gain wisdom and folly.

We may now say that our discourse about the nature of the universe has an end. The world has received animals, mortal and immortal, and is fulfilled with them, and has become a visible animal containing the visible—the sensible God who is the image of the intellectual, the greatest, best, fairest, most perfect—the one only-begotten heaven.

# The Timaeus.

Translated by Thomas Taylor.

PERSONS OF THE DIALOGUE.

Socrates, Timæus.
Critias, Hermocrates.

Socrates:: I SEE one, two, three, but where, friend Timæus, is that fourth person, who being received by me yesterday at a banquet of disputation, ought now in his turn to repay me with a similar repast?

Timæus:: He labours, Socrates, under a certain infirmity; for he would not willingly be absent from such an association as the present.

Socrates:: It remains therefore for you, O Timæus, and the company present, to fill up the part of this absent guest.

Timæus:: Entirely so, Socrates. And we shall endeavor, to the utmost of our ability, to leave nothing belonging to such an employment unaccomplished. For it would be by no means just that we, who were yesterday entertained by you, in such a manner as guests ought to be received, should not return the hospitality with readiness and delight.

Socrates:: Do you recollect the magnitude and nature of the things which I proposed to you to explain?

Timæus:: Some things, indeed, I recollect; but such as I have forgotten do you recall into my memory. Or rather, if it be not too much trouble, run over the whole in a cursory manner from the beginning, that it may be more firmly established in our memory.

Socrates:: Let it be so. And to begin: The sum of yesterday's dispute was, what kind of republic appeared to me to be the best, and from what sort of men such a republic ought to be composed.

Timæus:: And by us, indeed, Socrates, all that you said was approved in the highest degree.

Socrates:: Did we not, in the first place, separate husbandmen and other artificers from those whom we considered as the defenders of the city?

Timæus:: Certainly.

Socrates:: And when we had assigned to every one that which was accommodated to his nature, and had prescribed only one particular employment to every particular art, we likewise assigned to the military tribe one province only, I mean that of protecting the city; and this as well from the hostile incursions of internal as of external enemies; but yet in such a manner as to administer justice mildly to the subjects of their government, as being naturally friends, and to behave with warlike fierceness against their enemies in battle.

Timæus:: Entirely so.

Socrates:: For we asserted, I think, that the souls of the guardians should be of such a nature, as at the same time to be both irascible and philosophic in a remarkable degree; so that they might be gentle to their friends, and bold and ferocious to their enemies.

Timæus:: You did so.

Socrates:: But what did we assert concerning their education? Was it not that they should be instructed in gymnastic exercises, in music, and other becoming disciplines?

Timæus:: Entirely so.

Socrates:: We likewise established, that those who were so educated should neither consider gold, or silver, or any goods of a similar kind, as their own private property; but that rather, after the manner of adjutants, they should receive the wages of guardianship from those whom they defend and preserve; and that their recompense should be no more than is sufficient to a moderate subsistence. That, besides this, they should use their public stipend in common, and for the purpose of procuring a common subsistence with each other; so that, neglecting every other concern, they may employ their attention solely on virtue, and the discharge of their peculiar employment.

Timæus:: These things also were related by you.

Socrates:: Of women too we asserted, that they should be educated in such a manner, as to be aptly conformed similar to the natures of men; with whom they should perform in common both the duties of war, and whatever else belongs to the business of life.

Timæus:: This too was asserted by you.

Socrates:: But what did we establish concerning the procreation of children? Though perhaps you easily remember this, on account of its novelty. For we ordered that the marriages and children should be common; as we were particularly careful that no one might be able to distinguish his own children, but that all might consider all as their kindred; that hence those of an equal age might regard themselves as brothers and sisters; but that the younger might reverence the elder as their parents and grandfathers, and the elder might esteem the younger as their children and grandsons.

Timæus:: These things, indeed, as you say, are easily remembered.

Socrates:: But that they might from their birth acquire a disposition as far as possible the best, we decreed that the rulers whom we placed over the marriage rites should, through the means of certain lots, take care that in the nuptial league the worthy were mingled with the worthy; that no discord may arise in this connection when it does not prove prosperous in the end; but that all the blame may be referred to fortune, and not to the guardians of such a conjunction.

Timæus:: We remember this likewise.

Socrates:: We also ordered that the children of the good should be properly educated, but that those of the bad should be secretly sent to some other city; yet so that such of the adult among these as should be found to be of a good disposition should be recalled from exile; while, on the contrary, those who were retained from the first in the city as good, but proved afterwards bad, should be similarly banished.

Timæus:: Just so.

Socrates:: Have we, therefore, sufficiently epitomized yesterday's disputation; or do you require any thing further, friend Timæus, which I have omitted?

Timæus:: Nothing, indeed, Socrates; for all this was the subject of your disputation.

Socrates:: Hear now how I am affected towards this republic which we have described; for I will illustrate the affair by a similitude. Suppose then that some one, on beholding beautiful animals, whether represented in a picture, or really alive, but in a state of perfect rest, should desire to behold them in motion, and struggling as it were to imitate those gestures which seem particularly adapted to the nature of bodies; in such a manner am I affected towards the form of that republic which we have described. For I should gladly hear any one relating the contests of our city with other nations, when it engages in a becoming manner in war, and acts during such an engagement in a manner worthy of its institution, both with respect to practical achievements and verbal negotiations. For indeed, O Critias and Hermocrates, I am conscious of my own inability to praise such men and such a city according to their desert. Indeed, that I should be incapable of such an undertaking is not wonderful, since the same imbecility seems to have attended poets both of the past and present age. Not that I despise the poetic tribe; but it appears from hence evident, that, as these kind of men are studious of imitation, they easily and in the best manner express things in which they have been educated; while, on the contrary, whatever is foreign from their education they imitate with difficulty in actions, and with still more difficulty in words. But with respect to the tribe of Sophists, though I consider them as skilled both in the art of speaking and in many other illustrious arts; yet, as they have no settled abode, but wander daily through a multitude of cities, I am afraid lest, with respect to the institutions of philosophers and politicians, they should not be able to conjecture the quality and magnitude of those concerns which wise and politic men are engaged in with individuals, in warlike undertakings, both in actions and discourse. It remains, therefore, that I should apply to you, who excel in the study of wisdom and civil administration, as well naturally as through the assistance of proper discipline and institution. For Timæus here of Locris, an Italian city governed by the best of laws, exclusive of his not being inferior to any of his fellow-citizens in wealth and nobility, has arrived in his own city at the highest posts of government and honours. Besides, we all know that Critias is not ignorant of the particulars of which we are now speaking. Nor is this to be doubted of Hermocrates, since a multitude of circumstances evince that he is both by nature and education adapted to all such concerns. Hence, when you yesterday requested me to dispute about the institution of a republic, I readily complied with your request; being persuaded that the remainder of the discourse could not be more conveniently explained by any one than by you, if you were but willing to engage in its discussion. For, unless you properly adapt the city for warlike purposes, there is no one in the present age from whom it can acquire every thing becoming its constitution. As I have, therefore, hitherto complied with your request, I shall now require you to comply with mine in the above-mentioned particulars. Nor have you indeed refused this employment, but have with common consent determined to repay my hospitality with the banquet of discourse. I now, therefore, stand prepared to receive the promised feast.

Hermocrates:: But we, O Socrates, as Timæus just now signified, shall cheerfully engage in the execution of your desire; for we cannot offer any excuse sufficient to justify neglect in this affair. For yesterday, when we departed from hence and went to the lodging of Critias, where we are accustomed to reside, both in his apartment and prior to this in the way thither we discoursed on this very particular. He therefore related to us a certain antient history, which I wish, O Critias, you would now repeat to Socrates, that he may judge whether it any way conduces to the fulfilment of his request.

Critias:: It is requisite to comply, if agreeable to Timæus, the third associate of our undertaking.

Timæus:: I assent to your compliance.

Critias:: Hear then, O Socrates, a discourse surprising indeed in the extreme, yet in every respect true, as it was once related by Solon, the most wise of the seven wise men. Solon, then, was the familiar and intimate friend of our great-grandfather Dropis, as he himself often relates in his poems. But he once declared to our grandfather Critias, (as the old man himself informed us,) that great and admirable actions had once been achieved by this city, which nevertheless were buried in oblivion, through length of time and the destruction of mankind. In particular he informed me of one undertaking more illustrious than the rest, which I now think proper to relate to you, both that I may repay my obligations, and that by such a relation I may offer my tribute of praise to the Goddess in the present solemnity, by celebrating her divinity, as it were, with hymns, justly and in a manner agreeable to truth.

Socrates:: You speak well. But what is this antient achievement which was not only actually related by Solon, but was once really accomplished by this city?

Critias:: I will acquaint you with that antient history, which I did not indeed receive from a youth, but from a man very much advanced in years, for at that time Critias, as he himself declared, was almost ninety years old, and I myself was about ten. When, therefore, that solemnity was celebrated among us which is known by the name of *Cureotis Apaturiorum*, nothing was omitted which boys in that festivity are accustomed to perform. For, when our parents had set before us the rewards proposed for the contest of singing verses, both a multitude of verses of many poets were recited, and many of us especially sung the poems of Solon, because they were at that time entirely new. But then one of our tribe, whether he was willing to gratify Critias, or whether it was his real opinion, affirmed that Solon appeared to him most wise in other concerns, and in things respecting poetry the most ingenious of all poets. Upon hearing this, the old man (for I very well remember) was vehemently delighted; and said, laughing—If Solon, O Amynander, had not engaged in poetry as a casual affair, but had made it, as others do, a serious employment; and if through seditions and other fluctuations of the state, in which he found his country involved, he had not been compelled to neglect the completion of the history which he brought from Egypt, I do not think that either Hesiod or Homer, or any other poet, would have acquired greater glory and renown. In consequence of this, Amynander inquired of Critias what that history was. To which he answered, that it was concerning an affair the greatest and most celebrated which this city ever performed; though through length of time, and the destruction of those by whom it was undertaken, the fame of its execution has not reached the present age. But I beseech you, O Critias, (say Amynander,) relate this affair from the beginning; and inform me what that event was which Solon asserted as a fact, and on what occasion, and from whom he received it.

There is then (says he) a certain region of Egypt called Delta, about the summit of which the streams of the Nile are divided. In this place a government is established called Saitical; and the chief city of this region of Delta is Sais, from which also king Amasis derived his origin. The city has a presiding divinity, whose name is in the Egyptian tongue Neith, and in the Greek Athena, or Minerva. These men were friends of the Athenians, with whom they declared they were very familiar, through a certain bond of alliance. In this country Solon, on his arrival thither, was, as he himself relates, very honourably received. And upon his inquiring about antient affairs of those priests who possessed a knowledge in such particulars superior to others, he perceived, that neither himself, nor any one of the Greeks, (as he himself declared), had any knowledge of very remote antiquity. Hence, when he once desired to excite them to the relation of antient transactions, he for this purpose began to discourse about those most antient events which formerly happened among us. I mean the traditions concerning the first Phoroneus and Niobe, and after the deluge, of Deucalion and Pyrrha, (as described by the mythologists,) together with their posterity; at the same time paying a proper attention to the different ages in which these events are said to have subsisted. But upon this one of those more antient priests exclaimed, O Solon, Solon, you Greeks are always children, nor is there any such thing as an aged Grecian among you! But Solon, when he heard this—What (says he) is the motive of your exclamation? To whom the priest:—Because all your souls are juvenile; neither containing any antient opinion derived from remote tradition, nor any discipline hoary from its existence in former periods of time. But the reason of this is the multitude and variety of destructions of the human race, which formerly have been, and again will be: the greatest of these, indeed, arising from fire and water; but the lesser from ten thousand other contingencies. For the relation subsisting among you, that Phaeton, the offspring of the Sun, on a certain time attempting to drive the chariot of his father, and not being able to keep the track observed by his parent, burnt up the natures belonging to the earth, and perished himself, blasted by thunder—is indeed considered as fabulous, yet is in reality true. For it expresses the mutation of the bodies revolving in the heavens about the earth; and indicates that, through long periods of time, a destruction of terrestrial natures ensues from the devastations of fire. Hence, those who either dwell on mountains, or in lofty and dry places, perish more abundantly than those who dwell near rivers, or on the borders of the sea. To us indeed the Nile is both salutary in other respects, and liberates us from the fear of such-like depredations. But when the Gods, purifying the earth by waters, deluge its surface, then the herdsmen and shepherds inhabiting the mountains are preserved, while the inhabitants of your cities are hurried away to the sea by the impetuous inundation of the rivers. On the contrary, in our region, neither then, nor at any other time, did the waters descending from on high pour with desolation on the plains; but they are naturally impelled upwards from the bosom of the earth. And from these causes the most antient traditions are preserved in our country. For, indeed, it may be truly asserted, that in those places where neither intense cold nor immoderate heat prevails, the race of mankind is always preserved, though sometimes the number of individuals is increased, and sometimes suffers a considerable diminution. But whatever has been transacted either by us, or by you, or in any other place, beautiful or great, or containing any thing uncommon, of which we have heard the report, every thing of this kind is to be found described in our temples, and preserved to the present day. While, on the contrary, you and other nations commit only recent transactions to writing, and to other inventions which society has employed for transmitting information to posterity; and so again, at stated periods of time, a certain celestial defluxion rushes on them like a disease; from whence those among you who survive are both destitute of literary acquisitions and the inspiration of the Muses. Hence it happens that you become juvenile again, and ignorant of the events which happened in antient times, as well among us as in the regions which you inhabit.

The transactions, therefore, O Solon, which you relate from your antiquities, differ very little from puerile fables. For, in the first place, you only mention one deluge of the earth, when at the same time many have happened. And, in the next place, you are ignorant of a most illustrious and excellent race of men, who once inhabited your country; from whence you and your whole city descended, though a small seed only of this admirable people once remained. But your ignorance in this affair is owing to the posterity of this people, who were for many ages deprived of the use of letters, and became as it were dumb. For prior, O Solon, to that mighty deluge which we have just mentioned, a city of Athenians existed, informed according to the best laws both in military concerns and every other duty of life; and whose illustrious actions and civil institutions are celebrated by us as the most excellent of all that have existed under the ample circumference of the heavens. Solon, therefore, upon hearing this, said that he was astonished; and, burning with a most ardent desire, entreated the priests to relate accurately all the actions of his antient fellow-citizens. That afterwards one of the priests replied:—Nothing of envy, O Solon, prohibits us from complying with your request. But for your sake, and that of your city, I will relate the whole; and especially on account of that Goddess who is allotted the guardianship both of your city and ours, and by whom they have been educated and founded: yours, indeed, by a priority to ours of a thousand years, receiving the seed of your race from Vulcan and the Earth. But the description of the transactions of this our city during the space of eight thousand years, is preserved in our sacred writings. I will, therefore, cursorily run over the laws and more illustrious actions of those cities which existed nine thousand years ago. For when we are more at leisure we shall prosecute an exact history of every particular, receiving for this purpose the sacred writings themselves.

In the first place, then, consider the laws of these people, and compare them with ours: for you will find many things which then subsisted in your city, similar to such as exist at present. For the priests passed their life separated from all others. The artificers also exercised their arts in such a manner, that each was engaged in his own employment without being mingled with other artificers. The same method was likewise adopted with shepherds, hunters and husbandmen. The soldiers too, you will find, were separated from other kind of men; and were commanded by the laws to engage in nothing but warlike affairs. A similar armour too, such as that of shields and darts, was employed by each. These we first used in Asia; the Goddess in those places, as likewise happened to you, first pointing them out to our use. You may perceive too from the beginning what great attention was paid by the laws to prudence and modesty; and besides this, to divination and medicine, as subservient to the preservation of health. And from these, which are divine goods, the laws, proceeding to the invention of such as are merely human, procured all such other disciplines as follow from those we have just enumerated. From such a distribution, therefore, and in such order, the Goddess first established and adorned your city, choosing for this purpose the place in which you were born; as she foresaw that, from the excellent temperature of the region, men would arise distinguished by the most consummate sagacity and wit, For, as the Goddess is a lover both of wisdom and war, she fixed on a soil capable of producing men the most similar to herself; and rendered it in every respect adapted for the habitation of such a race. The antient Athenians, therefore, using these laws, and being formed by good institutions, in a still higher degree than I have mentioned, inhabited this region; surpassing all men in every virtue, as it becomes those to do who are the progeny and pupils of the Gods.

But, though many and mighty deeds of your city are contained in our sacred writings, and are admired as they deserve, yet there is one transaction which surpasses all of them in magnitude and virtue. For these writings relate what prodigious strength your city formerly tamed, when a mighty warlike power, rushing from the Atlantic sea, spread itself with hostile fury over all Europe and Asia. For at that time the Atlantic sea was navigable, and had an island before that mouth which is called by you the Pillars of Hercules. But this island was greater than both Libya and all Asia together, and afforded an easy passage to other neighbouring islands; as it was likewise easy to pass from those islands to all the continent which borders on this Atlantic sea. For the waters which are beheld within the mouth which we just now mentioned, have the form of a bay with a narrow entrance; but the mouth itself is a true sea. And lastly, the earth which surrounds it is in every respect truly denominated the continent. In this Atlantic island a combination of kings was formed, who with mighty and wonderful power subdued the whole island, together with many other islands and parts of the continent; and, besides this, subjected to their dominion all Libya, as far as to Egypt; and Europe, as far as to the Tyrrhene sea. And when they were collected in a powerful league, they endeavored to enslave all our regions and yours, and besides this all those places situated within the mouth of the Atlantic sea. Then it was, O Solon, that the power of your city was conspicuous to all men for its virtue and strength. For, as its armies surpassed all others both in magnanimity and military skill, so with respect to its contests, whether it was assisted by the rest of the Greeks, over whom it presided in warlike affairs, or whether it was deserted by them through the incursions of the enemies, and became situated in extreme danger, yet still it remained triumphant. In the mean time, those who were not yet enslaved it liberated from danger; and procured the most ample liberty for all those of us who dwell within the Pillars of Hercules. But in succeeding time prodigious earthquakes and deluges taking place, and bringing with them desolation in the space of one day and night, all that warlike race of Athenians was at once merged under the earth; and the Atlantic island itself, being absorbed in the sea, entirely disappeared. And hence that sea is at present innavigable, arising from the gradually impeding mud which the subsiding island produced. And this, O Socrates, is the sum of what the elder Critias repeated from the narration of Solon.

But when yesterday you was discoursing about a republic and its citizens, I was surprised on recollecting the present history: for I perceived how divinely, from a certain fortune, and not wandering from the mark, you collected many things agreeing with the narration of Solon. Yet I was unwilling to disclose these particulars immediately, as, from the great interval of time since I first received them, my remembrance of them was not sufficiently accurate for the purpose of repetition. I considered it, therefore, necessary that I should first of all diligently revolve the whole in my mind. And on this account I yesterday immediately complied with your demands: for I perceived that we should not want the ability of presenting a discourse accommodated to your wishes, which in things of this kind is of principal importance. In consequence of this, as Hermocrates has informed you, immediately as we departed from hence, by communicating these particulars with my friends here present, for the purpose of refreshing my memory, and afterwards revolving them in my mind by night, I nearly acquired a complete recollection of the affair. And, indeed, according to the proverb, what we learn in childhood abides in the memory with a wonderful stability. For, with respect to myself, for instance, I am not certain that I could recollect the whole of yesterday's discourse, yet I should be very much astonished if any thing should escape my remembrance which I had heard in some past period of time very distant from the present. Thus, as to the history which I have just now related, I received it from the old man with great pleasure and delight; who on his part very readily complied with my request, and frequently gratified me with a repetition. And hence, as the marks of letters deeply burnt in remain indelible, so all these particulars became firmly established in my memory. In consequence of this, as soon as it was day I repeated the narration to my friends, that together with myself they might be better prepared for the purposes of the present association. But now, with respect to that for which this narration was undertaken, I am prepared, O Socrates, to speak not only summarily, but so as to descend to the particulars of every thing which I heard. But the citizens and city which you fabricated yesterday as in a fable, we shall transfer to reality; considering that city which you established as no other than this Athenian city, and the citizens which you conceived as no other than those ancestors of ours described by the Egyptian priest. And indeed the affair will harmonize in every respect; nor will it be foreign from the purpose to assert that your citizens are those very people who existed at that time. Hence, distributing the affair in common among us, we will endeavor, according to the utmost of our ability, to accomplish in a becoming manner the employment which you have assigned us. It is requisite, therefore, to consider, O Socrates, whether this discourse is reasonable, or whether we should lay it aside, and seek after another.

Socrates:: But what other, O Critias, should we receive in preference to this? For your discourse, through a certain affinity, is particularly adapted to the present sacred rites of the Goddess. And besides this, we should consider, as a thing of the greatest moment, that your relation is not a mere fable, but a true history. It is impossible, therefore, to say how, and from whence, neglecting your narration, we should find another more convenient. Hence it is necessary to confess that you have spoken with good fortune; and it is equally necessary that I, on account of my discourse yesterday, should now rest from speaking, and be wholly attentive to yours.

Critias:: But now consider, Socrates, the manner of our disposing the mutual banquet of disputation. For it seems proper to us that Timæus, who is the most astronomical of us all, and is particularly knowing in the nature of the universe, should speak the first; commencing his discourse from the generation of the world, and ending in the nature of men. But that I after him, receiving the men which he has mentally produced, but which have been excellently educated by you, and introducing them to you according to the law of Solon, as to proper judges, should render them members of this city; as being in reality no other than those Athenians which were described as unknown to us in the report of the sacred writings. And that in future we shall discourse concerning them as about citizens and Athenians.

Socrates:: I seem to behold a copious and splendid banquet of disputation set before me. It is, therefore, now your business, O Timæus, to begin the discourse; having first of all, as is highly becoming, invoked the Gods according to law.

Timæus:: Indeed, Socrates, since those who participate but the least degree of wisdom, in the beginning of every undertaking, whether small or great, call upon Divinity, it is necessary that we (unless we are in every respect unwise) who are about to speak concerning the universe, whether it is generated or without generation, invoking the Gods and Goddesses, should pray that what we assert may be agreeable to their divinities, and that in the ensuing discourse we may be consistent with ourselves. And such is my prayer to the Gods, with reference to myself; but as to what respects the present company, it is necessary to pray that you may easily understand, and that I may be able to explain my meaning about the proposed subjects of disputation. In the first place, therefore, as it appears to me, it is necessary to define what that is which is always real being, but is without generation; and what that is *which is generated indeed*, or *consists in a state of becoming to be*, but which never *really is*. The former of these indeed is apprehended by intelligence in conjunction with reason, since it always subsists according to same. But the latter is perceived by opinion in conjunction with irrational sense, since it subsists in a state of generation and corruption, and never truly is. But whatever is generated is necessarily generated from a certain cause. For it is every way impossible that any thing should be generated without a cause. When, therefore, an artificer, in the fabrication of any work, looks to that which always subsists according to same, and, employing a paradigm of this kind, expresses the idea and power in his work, it is then necessary that the whole of his production should be beautiful. But when he beholds that which is in generation, and uses a generated paradigm, it is alike necessary that his work should be far from beautiful.

I denominate, therefore, this universe heaven, or the world, or by any other appellation in which it may particularly rejoice. Concerning which, let us in the first place consider that which, in the proposed inquiry about the universe, ought in the very beginning to be investigated; whether it always was, having no principle of generation, or whether it was generated, commencing its generation from a certain cause. It was generated. For this universe is visible, and has a body. But all such things are sensible. And sensibles are apprehended by opinion, in conjunction with sense. And such things appear to have their subsistence in becoming to be, and in being generated. But we have before asserted, that whatever is generated is necessarily generated from some cause. To discover, therefore, the artificer and father of the universe is indeed difficult; and when found it is impossible to reveal him through the ministry of discourse to all men.

Again: this is to be considered concerning him, I mean, according to what paradigm extending himself, he fabricated the world—whether towards an exemplar, subsisting according to that which is always the same, and similarly affected, or towards that which is generated. But, indeed, if this world is beautiful, and its artificer good, it is evident that he looked towards an eternal exemplar in its fabrication. But if the world be far from beautiful, which it is not lawful to assert, he necessarily beheld a generated instead of an eternal exemplar. But it is perfectly evident that he regarded an eternal paradigm. For the world is the most beautiful of generated natures, and its artificer the best of causes. But, being thus generated, it is fabricated according to that which is comprehensible by reason and intelligence, and which subsists in an abiding sameness of being. And from hence it is perfectly necessary that this world should be the resemblance of something. But to describe its origin according to nature is the greatest of all undertakings. In this manner, then, we must distinguish concerning the image and its exemplar. As words are allied to the things of which they are the interpreters, hence it is necessary, when we speak of that which is stable and firm, and intellectually apparent, that our reasons should be in like manner stable and immutable, and as much as possible irreprehensible, with every perfection of a similar kind. But that, when we speak concerning the image of that which is immutable, we should employ only probable arguments, which have the same analogy to the former as a resemblance to its exemplar. And, indeed, as essence is to generation, so is truth to faith. You must not wonder, therefore, O Socrates, since many things are asserted by many concerning the Gods and the generation of the universe, if I should not be able to produce the most approved and accurate reasons on so difficult a subject. But you ought to rejoice if it shall appear that I do not employ reasons less probable than others: at the same time remembering, that I who discourse, and that you who are my judges, possess the human nature in common; so that you should be satisfied if my assertions are but assimilative of the truth.

Socrates:: You speak excellently well, Timæus; and we shall certainly act in every respect as you advise. This introduction, indeed, of your discourse we wonderfully approve: proceed, therefore, with the subsequent disputation.

Timæus:: Let us declare then on what account the composing artificer constituted generation and the universe. The artificer, indeed, was good; but in that which is good envy never subsists about any thing which has being. Hence, as he was entirely void of envy, he was willing to produce all things as much as possible similar to himself. If, therefore, any one receives this most principal cause of generation and the world from wise and prudent men, he will receive him in a manner the most perfect and true. For, as the Divinity was willing that all things should be good, and that as much as possible nothing should be evil; hence, receiving every thing visible, and which was not in a state of rest, but moving with confusion and disorder, he reduced it from this wild inordination into order, considering that such a conduct was by far the best. For it neither ever was lawful, nor is, for the best of causes to produce any other than the most beautiful of effects. In consequence of a reasoning process, therefore, he found that among the things naturally visible there was nothing, the whole of which, if void of intelligence, could ever become more beautiful than the whole of that which is endued with intellect: and at the same time he discovered, that it was impossible for intellect to accede to any being, without the intervention of soul. Hence, as the result of this reasoning, placing intellect in soul and soul in body, he fabricated the universe; that thus it might be a work naturally the most beautiful and the best. In this manner, therefore, according to an assimilative reason, it is necessary to call the world an animal, endued with intellect, and generated through the providence of Divinity.

This being determined, let us consider what follows; and, in the next place, after the similitude of what animals the composing artificer constituted the world. Indeed, we must by no means think that he fashioned it similar to such animals as subsist in the form of a part, or have a partial subsistence: for, if it had been assimilated to an imperfect animal, it certainly would not have been beautiful. But we should rather establish it as the most similar of all things to that animal, of which other animals, both considered separately and according to their genera, are nothing more than parts. For this, indeed, contains all intelligible animals comprehended in itself; just as this world contains us and the other animals which are the objects of sight. For, the Divinity being willing to assimilate this universe in the most exquisite degree to that which is the most beautiful and every way perfect of intelligible objects, he composed it one visible animal, containing within itself all such animals as are allied to its nature. Do we therefore rightly conclude that there is but one universe; or is it more right to assert that there are many and infinite? But indeed there can be but one, if it be only admitted that it is fabricated according to an exemplar. For that which comprehends all intelligible animals whatever can never be the second to any other. For another animal again would be required about these two, of which they would be parts; and it would be more proper to assert that the universe is assimilated to this comprehending third, rather than to the other two. That the world, therefore, from its being singular or alone, might be similar to all-perfect animal—on this account the artificer neither produced two nor infinite worlds; but heaven, or the universe, was generated and will be one and only-begotten.

But since it is necessary that a corporeal nature should be visible and tangible, and since nothing can be visible without fire, and nothing tangible without something solid, and nothing solid without earth—hence the Divinity, beginning to fabricate, composed the body of the universe from fire and earth. But it is impossible for two things alone to cohere together without the intervention of a third; for a certain collective bond is necessary in the middle of the two. And that is the most beautiful of bonds which renders both itself and the natures which are bound remarkably one. But the most beautiful analogy naturally produces this effect. For when either in three numbers, or masses, or powers, as is the middle to the last, so is the first to the middle; and again, as is the last to the middle, so is the middle to the first: then the middle becoming both first and last, and the last and the first passing each of them into a middle position, they become all of them necessarily the same, as to relation to each other. But, being made the same with each other, all are one. If, then, it were necessary that the universe should be a superficies only, and have no depth, one medium would indeed be sufficient, both for the purpose of binding itself and the natures which it contains. But now it is requisite that the world should be a solid; and solids are never harmonized together by one, but always with two mediums. Hence, the Divinity placed water and air in the middle of fire and earth, and fabricated them as much as possible in the same ratio to each other; so that fire might be to air as air to water; and that as air is to water so water might be to earth. And from this conjunction and composition he rendered the world visible and tangible. Hence, from things of this kind, which are four in number, it must be confessed that the body of the universe was generated through analogy, conspiring into friendship with itself from their conjunction, and so aptly cohering in all its parts, as to be indissoluble except by its artificer, who bound it in this union and consent.

The composition of the world, therefore, received one whole of each of these four natures. For its composing artificer constituted it from all fire, water, air, and earth; leaving no part of any one of these, nor any power external to the world. For by a reasoning process he concluded that it would thus be a whole animal, in the highest degree perfect from perfect parts: that, besides this, it would be one, as nothing would be left from which any other such nature might be produced; and lastly, that it would be neither obnoxious to old-age nor disease. For he perceived that the heat and cold from which bodies are composed, and all such things as possess vigorous powers, when surrounding bodies externally, and acceding to them unseasonably, dissolve their union, and, introducing diseases and old-age, cause them to perish by decay.

Hence, through this cause and this reasoning process, he fabricated the universe one whole, composed from all wholes, perfect, undecaying, and without disease. He likewise gave to it a figure becoming and allied to its nature. For to the animal which was destined to comprehend all animals in itself, that figure must be the most becoming which contains within its ambit all figures of every kind. Hence, he fashioned it of a spherical shape, in which all the radii from the middle are equally distant from the bounding extremities; as this is the most perfect: of all figures, and the most similar to himself. For he considered that the similar was infinitely more beautiful than the dissimilar.

Besides this, he accurately polished the external circumference of the spherical world, and rendered it perfectly smooth. Nor was the addition of eyes requisite to the universe; for nothing visible remained external to itself. Nor were ears necessary; as there was nothing externally audible. Nor was the universe inverted with surrounding air, that it might be indigent of respiration. Nor, again, was it in want of any organ through which it might receive nutriment into itself, and discharge it when concocted: for there was no possibility that any thing could either accede to or depart from its nature, since there was nothing through which such changes could be produced. For, indeed, the universe affords nutriment to itself through its own consumption; and, being artificially fabricated, suffers and acts all things in itself, and from its own peculiar operations. For its composing artificer considered that it would be much more excellent if sufficient to itself, than if indigent of foreign supplies. But he neither thought that hands were necessary to the world, as there was nothing For it either to receive or reject; nor yet feet, nor any other members which are subservient to progression and rest.

For from among the seven species of local motion he selected one, which principally subsists about intellect and intelligence, and assigned it to the world as properly allied to its surrounding body. Hence, when he had led it round according to same, in same, and in itself, he caused it to move with a circular revolution. But he separated the other six motions from the world, and framed it void of their wandering progressions. Hence, as such a conversion was by no means indigent of feet, he generated the universe without legs and feet. When, therefore, that God who is a perpetually reasoning divinity cogitated about the God who was destined to subsist at some certain period of time, he produced his body smooth and equable; and every way from the middle even and whole, and perfect from the composition of perfect bodies. But, placing soul in the middle of the world, he extended it through the whole; and besides this, he externally invested the body of the universe with soul; and, causing circle to revolve in a circle, established the world one single, solitary nature, able through virtue to converse with itself, indigent of nothing external, and sufficiently known and friendly to itself. And on all these accounts he rendered the universe a happy God. But indeed the artificer did not produce soul, as we just now began to say, junior to body: for he who conjoined these would never permit that the more antient nature should be subservient to the younger. But we, as being much conversant with that which casually occurs, assert things of this kind in an assimilative way; while, on the contrary, the artificer of the world constituted soul both in generation and virtue prior to, and more antient than, body, as being the proper lord and ruler of its servile nature; and that in the following manner:

From an essence impartible, and always subsisting according to sameness of being, and from a nature divisible about bodies, he mingled from both a third form of essence, having a middle subsistence between the two. And again, between that which is impartible and that which is divisible about bodies, he placed the nature of same and different. And taking these, now they are three, he mingled them all into one idea. But as the nature of different could not without difficulty be mingled in same, he harmonized them together by employing force in their conjunction. But after he had mingled these two with essence, and had produced one from the three, he again divided this whole into becoming parts; at the same time mingling each part from same, different, and essence. But he began to divide as follows:—In the first place, he received one part from the whole. Then he separated a second part, double of the first; afterwards a third, sesquialter of the second, but triple of the first: then a fourth, double of the second; in the next place a fifth, triple of the third; a sixth, octuple of the first; and lastly a seventh, twenty-seven times more than the first. After this, he filled up the double and triple intervals, again cutting off parts from the whole; and placed them so between the intervals, that there might be two mediums in every interval; and that one of these might by the same part exceed one of the extremes, and be exceeded by the other; and that the other part might by an equal number surpass one of the extremes, and by an equal number be surpassed by the other. But as from hence sesquialter, sesquitertian, and sesquioctave intervals were produced, from those bonds in the first spaces, he filled with a sesquioctave interval all the sesquitertian parts, at the same time leaving a part of each of these. And then again the interval of this part being assumed, a companion is from thence obtained in terms of number to number, subsisting between 256 and 243. But now the whole of that mixture from which these were separated was consumed by such a section of parts. Hence he then cut the whole of this composition according to length, and produced two from one; and adapted middle to middle, like the form of the letter X. Afterwards he bent them into a circle, connecting them, both with themselves and with each other, in such a manner that their extremities might be combined in one directly opposite to the point of their mutual intersection; and externally comprehended them in a motion revolving according to sameness, and in that which is perpetually the same. And besides this, he made one of the circles external, but the other internal; and denominated the local motion of the exterior circle, the motion of that nature which subsists according to sameness; but that of the interior one, the motion of the nature subsisting according to difference. He likewise caused the circle partaking of sameness to revolve laterally towards the right hand; but that which partakes of difference diametrically towards the left. But he conferred dominion on the circulation of that which is same and similar: for he suffered this alone to remain undivided. But as to the interior circle, when he had divided it six times, and had produced seven unequal circles, each according to the interval of the double and triple; as each of them are three, he ordered the circles to proceed in a course contrary to each other:—and three of the seven interior circles he commanded to revolve with a similar swiftness; but the remaining four with a motion dissimilar to each other, and to the former three; yet so as not to desert order and proportion in their circulations.

After, therefore, the whole composition of the soul was completed according to the intention of its artificer, in the next place he fabricated within soul the whole of a corporeal nature; and, conciliating middle with middle, he aptly harmonized them together. But soul being every way extended from the middle to the very extremities of the universe, and investing it externally in a circle, at the same time herself revolving within herself, gave rise to the divine commencement of an unceasing and wise life, through the whole of time. And, indeed, the body of the universe was generated visible; but soul is in visible, participating of a rational energy and harmony, and subsisting as the best of generated natures, through its artificer, who is the best of intelligible and perpetual beings. Since, therefore, soul was composed from the mixture of the three parts same, different, and essence, and was distributed and bound according to analogy, herself at the same time returning by a circular energy towards herself; hence, when she touches upon any thing endued with a dissipated essence, and when upon that which is indivisible, being moved through the whole of herself, she pronounces concerning the nature of each—asserts what that is with which any thing is the same, from what it is different, to what it is related, where it is situated, how it subsists; and when any thing of this kind happens either to be or to suffer both in things which are generated and in such as possess an eternal sameness of being. Reason indeed, which is becoming to be true according to sameness, when it is conversant as well with different as same, evolving itself without voice or found in that which is moved by itself; when in this case it subsists about a sensible nature, and the circle characterized by difference properly revolving, enunciates any circumstance to every part of the soul with which it is connected; then stable and true opinions and belief are produced. But when again it evolves itself about that which is logistic, and the circle of sameness aptly revolving announces any particular thing, intellect and science are necessarily produced in perfection by such an operation. Whoever, therefore, asserts that this is ingenerated in any other nature than soul, asserts every thing rather than the truth.

But when the generating father understood that this generated resemblance of the eternal Gods moved and lived, he was delighted with his work, and in consequence of this delight considered how he might fabricate it still more similar to its exemplar. Hence, as that is an eternal animal, he endeavored to render this universe such, to the utmost of his ability. The nature indeed of the animal its paradigm is eternal, and this it is impossible to adapt perfectly to a generated effect. Hence he determined by a dianoëtic energy to produce a certain movable image of eternity: and thus, while he was adorning and distributing the universe, he at the same time formed an eternal image flowing according to number, of eternity abiding in one; and which receives from us the appellation of time. But besides this he fabricated, the generation of days and nights, and months and years, which had no subsistence prior to the universe, but which together with it rose into existence. And all these, indeed, are the proper parts of time. But the terms it was and it will be, which express the species of generated time, are transferred by us to an eternal essence, through oblivion of the truth. For we assert of such an essence that it was, is, and will be; while according to truth the term *it is* is alone accommodated to its nature. But we should affirm, that to have been and to be hereafter are expressions alone accommodated to generation, proceeding according to the flux of time: for these parts of time are certain motions. But that which perpetually subsists the same and immovable, neither becomes at any time older or younger; neither has been generated in some period of the past, nor will be in some future circulation of time; nor receives any circumstance of being, which generation adapts to natures hurried away by its impetuous whirl. For all these are nothing more than species of time imitating eternity, and circularly rolling itself according to number. Besides this, we likewise frequently assert that a thing which was generated is generated: that what subsists in becoming to be, is in generation; that what will be, is to be; and that non-being is not: no one of which assertions is accurately true. But perhaps a perfect discussion of these matters is not adapted to the present disputation.

But time was generated together with the universe, that being produced together they might together be dissolved, if any dissolution should ever happen to these. And time was generated according to the exemplar of an eternal nature, that this world might be the most similar possible to such a nature. For its exemplar is permanent being, through the whole of eternity; but the universe alone was generated, is, and will be, through the whole of time. After this manner, therefore, and from such a dianoëtic energy of Divinity about the generation of time, that he might give birth to its flowing subsistence, he generated the sun and moon, and the five other stars, which are denominated planets, for the purpose of distinguishing and guarding the numbers of time. But the Divinity, as soon as he had produced the bodies of these stars, placed them, being seven in number, in the seven circulations formed by the revolution of the nature distinguished by difference. The moon, indeed, he fixed in the first circulation about the earth; the sun in the second above the earth; the star called Lucifer, and that which is sacred to Mercury, in circulations revolving with a swiftness equal to the sun, to whom at the same time they are allotted a contrary power; in consequence of which, these stars, the Sun, Lucifer, and Mercury, mutually comprehend and are mutually comprehended by each other in a similar manner. But with respect to the other stars, if any one should think proper to investigate their circulations, and through what causes they are established, the labour would be greater than that of the discourse itself, for the sake of which they were introduced. An accurate discussion, therefore, of these particulars may, perhaps, be undertaken by us hereafter, if convenient leisure should fall to our lot.

When, therefore, each of the natures necessary to a joint fabrication of time had obtained a local motion adapted to its condition, and their bodies became animals through the connecting power of vital bonds, they then learned their prescribed order; that according to the oblique revolution of the circle of *difference*, which moves in subjection to the circle of *sameness*, these orbs should, by their revolution, partly form a more ample and partly a more contracted circle; and that the orb which formed a lesser circle should revolve swifter; but that which produced a greater, more slow:—but that in consequence of the motion of the circle of sameness the orbs which circulate most swiftly, comprehending other orbs as they revolve, should themselves appear to be comprehended by the revolution of the more slow. But all these circles revolve with a spiral motion, because they are agitated at one and the same time in two contrary directions: and in consequence of this, the sphere endued with the slowest revolution is nearest to that to which its course is retrograde, and which is the swiftest of all. And that these circles might possess a certain conspicuous measure of slowness and swiftness with reference to each other, and that the motion of the eight circulations might be manifest, the Divinity enkindled a light which we now denominate the Sun, in the second revolution from the earth; that the heavens might become eminently apparent to all things, and that such animals might participate of number as are adapted to its participation, receiving numerical information from the revolution of a nature similar and the same. From hence, therefore, night and day arose; and through these revolving bodies the period of one most wise circulation was produced.

And *month* indeed was generated, when the moon having run through her circle passed into conjunction with the sun. But year, when the sun had completely wandered round his orb. As to the periods of the other stars, they are not understood except by a very few of mankind; nor do the multitude distinguish them by any peculiar appellation; nor do they measure them with relation to each other, regarding the numbers adapted to this purpose. Hence, it may be said, they are ignorant that the wanderings of these bodies are in reality time; as these wanderings are endued with an infinite multitude, and an admirable variety of motions. But it is easy to conceive, that a perfect number of time will then accomplish a perfect year, when the eight circulations concurring in their courses with each other become bounded by the same extremity; being at the same time measured by the circle subsisting according to sameness. But the stars, whose revolutions are attended with a procession through the heavens, were generated, that the whole of this visible animal the universe might become most similar to the most perfect intelligible animal from an imitation of a perpetual nature. And indeed the artificer fabricated other forms, as far as to the generation of time, according to the similitude of the world’s exemplar.

But as the universe did not yet contain all animals in its capacious receptacle, in this respect it was dissimilar to its exemplar. Its artificer, therefore, supplied this defect by impressing it with forms, according to the nature of its paradigm. Whatever ideas, therefore, intellect perceived by the dianoëtic energy in animal itself, such and so many he conceived it necessary for the universe to contain. But these ideas are four: One, the celestial genus of Gods; another, winged and air-wandering; a third, the aquatic form; and a fourth, that which is pedestrial and terrene. The idea, therefore, of that which is divine, or the inerratic sphere, he for the most part fabricated from fire, that it might be most splendid and beautiful to behold. And as he meant to assimilate it to the universe, he rendered it circular; placed it in the wisdom of the best nature; ordered it to become the attendant of that which is best; and gave it a circular distribution about the heavens, that it might be a true world, adorned with a fair variety in its every part. But he adapted to each of the divine bodies two motions; one by which they might revolve in same according to same, by always cogitating the same things in themselves about same; the other through which they might be led with an advancing motion from the dominion of the same and similar circulation. He likewise rendered them immovable and stable as to the other five motions, that each of them might become in an eminent degree the best. And on this account such of the stars as are inerratic were generated, which are divine animals; and, in consequence of this, always abide revolving in that which is same. But, the stars, which both revolve and at the same time wander in the manner we have described above, were produced next to these. But he fabricated the earth the common nourisher of our existence; which being conglobed about the pole extended through the universe, is the guardian and artificer of night and day, and is the first and most antient of the Gods which are generated within the heavens. But the harmonious progressions of these divinities, their concursions with each other, the revolutions and advancing motions of their circles, how they are situated with relation to each other in their conjunctions and oppositions, whether direct among themselves or retrograde, at what times and in what manner they become concealed, and, again emerging to our view, cause terror, and exhibit tokens of future events to such as are able to discover their signification—of all this to attempt an explanation, without inspecting the resemblances of these divinities, would be a fruitless employment. But of this enough; and let this be the end of our discourse concerning the nature of the visible and generated Gods.

But to speak concerning the other dæmons, and to know their generation, is a talk beyond our ability to perform. It is, therefore, necessary in this case to believe in antient men; who being the progeny of the Gods, as they themselves assert, must have a clear knowledge of their parents. It is impossible, therefore, not to believe in the children of the Gods, though they should speak without probable and necessary arguments: but as they declare that their narrations are about affairs to which they are naturally allied, it is proper that, complying with the law, we should assent to their tradition. In this manner, then, according to them, the generation of these Gods is to be described:

That Ocean and Tethys were the progeny of heaven and earth. That from hence Phorcys, Saturn, and Rhea, and such as subsist together with these, were produced. That from Saturn and Rhea, Jupiter, Juno, and all such as we know are called the brethren of these descended. And lastly, others which are reported to be the progeny of these. When, therefore, all such Gods as visibly revolve, and all such as become apparent when they please, were generated, the Artificer of the universe thus addressed them: “Gods of Gods, of whom I am the demiurgus and father, whatever is generated by me is indissoluble, such being my will in its fabrication. Indeed every thing which is bound is dissoluble; but to be willing to dissolve that which is beautifully harmonized, and well composed, is the property of an evil nature. Hence, so far as you are generated, you are not immortal, nor in every respect indissoluble: yet you, shall never be dissolved, nor become subject to the fatality of death; my will being a much greater and more excellent bond than the vital connectives with which you were bound at the commencement of your generation. Learn, therefore, what I now say to you indicating my desire. Three genera of mortals yet remain to be produced. Without the generation of these, therefore, the universe will be imperfect; for it will not contain every kind of animal in its spacious extent. But it ought to contain them, that it may become sufficiently perfect. Yet if these are generated, and participate of life through me, they will become equal to the Gods. That mortal natures, therefore, may subsist, and that the, universe may be truly all, convert yourselves, according to your nature, to the fabrication of animals, imitating the power which I employed in your generation. And whatever among these is of such a nature as to deserve the same appellation with immortals, which obtains sovereignty in these, and willingly pursues justice, and reverences you—of this I myself will deliver the seed and beginning: it is your business to accomplish the rest; to weave together the mortal and immortal nature; by this means fabricating and generating animals, causing them to increase by supplying them with aliment, and receiving them back again when dissolved by corruption."

Thus spoke the demiurgus; and again into the same crater, in which mingling he had tempered the soul of the universe, he poured mingling the remainder of the former mixture: in a certain respect indeed after the same manner, yet not similarly incorruptible according to the same, but deficient from the first in a second and third degree. And having thus composed the universe, he distributed souls equal in number to the stars, inserting each in each: and causing them to ascend as into a vehicle, he pointed out to them the nature of the universe, and announced to them the laws of fate; showing them that the first generation orderly distributed to all was one, lest any particular soul should be allotted a less portion of generation than another. But when he had disseminated them through the several instruments of time adapted to each, he declared to them it was necessary that an animal the most religious of all others should make its appearance. But as the human nature is two-fold, he showed them that the more excellent kind was that which would afterwards be called man. And as souls are from necessity engrafted in bodies, and as something accedes to and something departs from such bodies, he declared to them that, in the first place, one connate sense produced by violent passions was necessary to all; and, in the second place, love mingled with pleasure and grief. That after these, fear and anger were necessary, with whatever else is either consequent to these, or naturally discordant from a contrary nature. That such souls as subdue these would live justly, but such as are vanquished by them unjustly. And again, that he who lived well during the proper time of his life, should, again returning to the habitation of his kindred star, enjoy a blessed life. But that he whose conduct was depraved, should in his second generation be changed into the nature of a woman. That both these, at the expiration of a thousand years, should return to the allotment and choice of a second life; each soul receiving a life agreeable to its choice. That in this election the human soul should pass into the life of a brute: and that in case the inclination to evil should not even then cease, but the defilement of vice remain according to a similitude of the mode of generation, then the soul should be changed into the nature of a brute correspondent to its disposition. And that it should not be freed from the allotment of labours, till, following the revolution of that same and similar nature contained in its essence, it vanquishes those abundantly turbulent affections, tumultuous and irrational, adhering to it afterwards from fire, water, air, and earth, and returns to the first and best disposition of its nature.

When he had instructed souls in all these particulars, that he might be in no respect the cause of the future evil of each, he disseminated some of them into the earth, others into the moon, and others into the remaining different instruments of time. But after this semination he delivered to the junior Gods the province of fabricating mortal bodies, and generating whatever else remained necessary to the human soul; and gave them dominion over every thing consequent to their fabrications. He likewise commanded them to govern as much as possible in the best and most beautiful manner the mortal animal, that it might not become the cause of evil to itself. At the same time he who orderly disposed all these particulars remained in his own accustomed abiding habit. But in consequence of his abiding, as soon as his children understood the order of their father, they immediately became obedient to this order; and receiving the immortal principle of mortal animal, in imitation of their artificer, they borrowed from the world the parts of fire and earth, water and air, as things which they should restore back again; and conglutinated the received parts together, not with the same indissoluble bonds which they themselves participated, but gave them a tenacious adherence from thick let nails, invisible through their smallness;

fabricating the body of each, one from the composition of all; and binding the circulations of the immortal soul in the influxive and effluxive nature of body.

But these circulations, being merged in a profound river, neither govern nor are governed, but hurry and are hurried along with violence: in consequence of which, the whole animal is indeed moved, yet in a disorderly manner; since from every kind of motion its progression is fortuitous and irrational. For it proceeds backwards and forwards, to the right and left, upwards and downwards, and wanders every way according to the six differences of place. For though the inundating and effluxive waves pour along with impetuous abundance, which afford nutrition to the animal, yet a still greater tumult and agitation is produced through the passions arising from external impulsions: and this either when the body is disturbed by the sudden incursion of external fire, or by the solidity of earth, or receives an injury from the whirling blasts of the air. For from all these, through the medium of the body, various motions are hurried along, and fall with molestation on the soul. But on this account all these were afterwards, and are even now, denominated senses. And these, indeed, both at first and at present, are the sources of an abundant and mighty motion, in conjunction with that perpetually flowing river, moving and vehemently agitating the circulations of the soul, every way fettering the revolution of the nature characterized by sameness, through flowing in a contrary direction, and retraining its energies by their conquering and impetuous progressions. But they agitate and tear in pieces the circulation of the nature distinguished by difference. Hence, they whirl about with every kind of revolution each of the three intervals of the double and triple, together with the mediums and conjoining bonds of the sesquitertian, sesquialter, and sesquioctave ratios, which cannot be dissolved by any one except the artificer by whom they were bound: and besides this, they induce all the fractures and diversities of circles which it is possible to effect; so that, scarcely being connected with each other, they are borne along indeed, yet in an irrational manner, at one time in a contrary, at another time in an oblique, and then again in a resupine situation. Just as if any one, in an inverted position, should fix his head on the earth and raise his feet on high; for in such a situation both the inverted person and the spectators would mutually imagine the right hand parts to be on the left, and the left to be on the right. So with respect to the circulations of the soul, the very same affections, and others of a similar kind, vehemently take place; and hence, when this is the case, if any thing external occurs, characterized by the nature of same or different, they denominate things the same with, or different from, others in a manner contrary to the truth. Hence they become false, and destitute of intelligence; nor is any revolution to be found among them in such a situation which energizes with the authority of a ruler and chief.

But when certain senses, borne along externally, strike against the soul and attract the whole of its receptacle, then the circulations which are in reality in subjection appear to have dominion: and hence, in consequence of all these passions, the soul becomes insane at present, and was so from the first period of her being bound in a mortal body. However, when the river of increase and nutrition flows along with a more gentle and less abundant course, the circulations, being again restored to tranquillity, proceed in their proper path; in process of time become more regular and steady, and pass into a figure accommodated to their nature. Hence, in this case, the revolutions of each of the circles becoming direct, and calling both same and different by their proper appellations, they render the being by whom they are possessed prudent and wise. If any one, therefore, receives a proper education in conjunction with convenient nutriment, such a one will possess perfect health, and will every way avoid the most grievous disease. But when this is neglected by any individual, such a one, proceeding along the path of life in a lame condition, will again pass into Hades imperfect and destitute of intelligence. These are particulars, however, which happen posterior to the production of mankind. But it is our business at present to discourse more accurately concerning the first composition of our nature, and to show, in the first place, from assimilative reasons, through what cause and providence of the Gods the several members of the body were accommodated to the several employments of the soul.

In the first place, then, the Gods bound the two divine circulations of the soul in a spherical body, in imitation of the circular figure of the universe: and this part of the body is what we now denominate the head; a most divine member, and the sovereign ruler of our whole corporeal composition, through the decree of the Gods, who considered that it would participate of all possible motions. Lest, therefore, the head, by rolling like a cylinder on the earth, which is distinguished by all-various heights and depths, should be unable to pass over its inequalities and asperities, the Gods subjected this upright figure of the body, as a pliable vehicle to the head. Hence, in consequence of the body being endued with length, they extended four naturally flexible members; Divinity fabricating a progression through which the body might apprehend any object, might receive a stable support, and might be able to pass through every place, bearing on high the head, our most divine and sacred habitation. For this purpose, therefore, they furnished us with legs and hands. And as the Gods considered that the anterior parts are more honourable and adapted to rule than the posterior, they gave us a motion for the most part consisting of a forward progression. Beside this, it was requisite that the anterior parts of our body should be divided from each other, and be dissimilar: and on this account they first placed about the cavity of the head the face; fixed in it organs subservient to all the providential energies of the soul, and determined that the natural government of man should consist in this anterior part of the body. But they fabricated the luciferous eyes the first of all the corporeal organs, binding them in the face on the following account. Of that fire which does not burn, indeed, but which comprehends our proper diurnal light, the Gods fabricated the orbs of the eyes. For the fire contained within our body, and which is the genuine brother of this diurnal fire, they caused to flow through the eyes with smoothness, and collected abundance, condensed indeed in the whole, but especially in the middle of these lucid orbs; so as that the more dense fire might remain concealed within the recesses of the eyes, and the pure might find a passage and fly away. When, therefore, the diurnal light subsists about the effluxive river of the light, then, similar concurring and being mingled with similar, one domestic body is constituted according to the direct procession of the eyes; and this too in that part where the internally emitted light resists that which is externally adduced. But the whole becoming similarly passive through similitude, when it either touches any thing else or is itself touched by another, then the motion produced by this contact discussing itself through the whole body of the eye, as far as to the soul, causes that sensation which we denominate sight. But when this kindred fire departs into night, the conjunct on being dissolved, sight loses its power. For in this case, proceeding into a dissimilar nature, it is changed, and becomes extinct: since it is by no means connate with the proximate surrounding air, which is naturally destitute of fire. Hence it ceases from seeing; and, besides this, becomes the introducer of sleep. For the Gods fabricated the nature of the eyelids as a salutary guardian of the sight; that, these being compressed, the inward fiery power of the eye might be restrained from any further emission; that, besides this, they might sprinkle over and equalize the eye's internal motions; and that, when equalized, rest might be produced.

But when much rest takes place, sleep attended with few dreams is produced. On the contrary, if certain more vehement motions remain, then such as is the nature of these relics, and the places in which they were produced, such and so many will be the similar phantasms within, and of which we shall possess the remembrance when we are externally roused. But with respect to the images produced in mirrors, and all such things as are visible in that which is apparent and smooth, there is nothing in these difficult of solution. For, from the communication of the external and internal fire with each other, and from that fire which subsists about the smooth body, and becomes abundantly multiplied, all such appearances are necessarily produced as take place when the fire of the eyes mingles itself with the fire diffused about the smooth and splendid object of vision. But the right hand parts appear to be the left, because a contact takes place between the contrary parts of the sight and the contrary parts of the object, different from the accustomed mode of perception. On the contrary, the right hand parts appear on the right, and the left hand on the left, when the mingled light leaps forth, together with that with which it is mingled. When the smoothness of the mirrors receives this here and there in an elevated manner, it repels the right hand part of the sight to the left of the mirror, and the left to the right. But if the mirror is turned according to the length of the countenance, it causes the whole face to appear resupine, by repelling the downward part of the splendour towards the upward part, and again the upper towards the downward part. All such particulars as these, therefore, are but causal assistants, which the Divinity employed as subservient to rendering the idea of that which is best as far as possible complete. *But the multitude are of opinion that these are not causal assistants, but the real causes of all things; I mean such things as are capable of giving cold and heat, rarity and density, with whatever produces such-like affections, but is incapable of possessing reason and intellect.* For soul must be considered as the only thing among beings by which intellect can be possessed. And this is in visible. But fire and water, air and earth, are all of them visible bodies. *It is, however, necessary that the lover of intellect and science should explore the first causes of prudent nature; and that he should consider such things as are moved by others, and at the same time necessarily give motion to other things, as nothing more than secondary causes.* Hence it is proper that we should speak concerning both kinds of causes; separately of such as fabricate things beautiful and good in conjunction with intellect, and of such as, being left destitute of wisdom, produce each particular in a casual and disorderly manner. Concerning the second causes of the eyes, therefore, which contribute to the possession of the power they are now allotted, what has been already said is sufficient.

But the greatest employment of the eyes, with respect to the use for which they were bestowed on us by the Divinity, we shall now endeavor to explain. For, in my opinion, the sight is the cause of the greatest emolument to us on the present occasion; since what we are now discoursing concerning the universe could never have been discovered without surveying the stars, the sun, and the heavens. But now, from beholding day and night, we are able to determine by arithmetical calculation the periods of months and years; to acquire a conception of time, and to scrutinize the nature of the universe. But from all this we obtain the possession of philosophy; a greater good than which never was nor ever will be bestowed by the Gods on the mortal race. And this is what I call the greatest benefit of the eyes. But why should I celebrate other particulars of less consequence, which he who is not a philosopher, since destitute of sight, may attempt to explore, but will explore in vain? By us, indeed, it is asserted that Divinity bestowed sight on us for this purpose, that on surveying the circulations of intellect in the heavens we may properly employ the revolutions of our dianoëtic part, which are allied to their circulations; and may recall the tumultuous motions of our discursive energies to the orderly processions of their intellectual periods. That besides this, by learning these and participating right reason according to nature, and imitating the revolutions of Divinity which are entirely inerratic, we may give stability to the wanderings of our dianoëtic energy.

But concerning voice and hearing, we again assert that they were bestowed on us by the Gods on the same account. For the acquisition of speech pertains to these, and is of the greatest advantage to their possession. And whatever utility musical voice brings to the sense of hearing, was bestowed for the sake of harmony. But harmony, possessing motions allied to the revolutions of our soul, is useful to the man who employs the Muses in conjunction with intellect; but is of no advantage to irrational pleasure, though it appears to be so at present. Indeed, it was given us by the Muses for the purpose of reducing the dissonant circulation of the soul to an order and symphony accommodated to its nature. Rhythm too was bestowed on us for this purpose; that we might properly harmonize that habit in our nature, which for the most part is void of measure, and indigent of the Graces. And thus far, a few particulars excepted, have we shown the fabrications of intellect. But it is likewise requisite to give a place in our discourse to the productions of necessity. For, the generation of the world being mingled, it was produced from the composition of intellect and necessity. But intellect ruling over necessity persuaded it to lead the most part of generated natures to that which is best; and hence necessity being vanquished by wise persuasion, from these two as principles the world arose. If, then, any one truly asserts that the universe was generated according to these, he should also mingle with it the form of an erratic cause, which it is naturally adapted to receive. In this manner then let us return; and, assuming a convenient principle of these, again discourse concerning them as about the former particulars, commencing our discussion from their origin. Let us, therefore, speculate the nature and passions of fire and water, air and earth, prior to the generation of the heavens. No one, indeed, as yet has unfolded the generation of these: but we speak of fire, and the other elements, as if the nature of each was known; and place them as the principles of the universe, when at the same time they ought not to be assimilated to elements, not even as in the rank of syllables, by men who in the smallest degree merit the appellation of wise. But now we shall not speak of the principle or principles, or whatever other denomination they may receive, of all things; and this for no other reason than the difficulty of delivering what appears to be the truth about these in the present mode of disputation. Neither, therefore, is it proper that you should expect me to speak, nor that I should persuade myself into a belief of being able to speak with perfect rectitude on so difficult a subject. But it is proper, as I told you in the beginning of this discourse, that, preserving all the force of assimilative reasons, we should endeavor to deliver that which is not less assimilative of the truth than the doctrine of others; and that in this manner we should discourse from the beginning concerning particulars and the whole. In the first place, therefore, invoking the Divinity who is the saviour of discourse, and beseeching him to lead us from an absurd and unusual exposition to an assimilative doctrine, we shall again begin to speak.

But it is necessary that the beginning of our present disputation should receive a more ample division than the former one. For then we made a distribution into two species: but now a third sort must be added. In the former disputation two species were sufficient; one of which was established as the form of an exemplar, intelligible and always subsisting according to same; but the other was nothing more than the imitation of the paradigm, generated and visible. But we did not then distribute a third, because we considered these two as sufficient. However, now reason seems to urge as a thing necessary, that we should endeavor to render apparent by our discourse the species which subsists as difficult and obscure. What apprehension then can we form of its power and nature? Shall we say that it is in an eminent degree the receptacle, and as it were nurse, of all generation? Such an assertion will, indeed, be true; but it is requisite to speak more clearly concerning it. And this will certainly be an arduous undertaking on many accounts, but principally because it will be necessary to doubt previous to its discussion concerning fire and the rest of the elements, why any one of these should be called water rather than fire, or air rather than earth; or why any one should be denominated some definite particular rather than all. For it is indeed difficult to frame any certain opinion, or to employ any stable discourse about such intricate forms. After what manner, then, and in what respect, and what of an assimilative nature shall we assert in this dubious inquiry?

In the first place, then, that which we now denominate water, when it loses its fluidity by concretion, appears to become stones and earth; but, when liquefied and dispersed, it forms vapour and air. Likewise, air when burnt up becomes fire. And, on the contrary, fire becoming concrete and extinct passes again into the form of air. And again, air becoming collected and condensed produces mists and clouds. But from these still more compressed rain descends. And from water, again, earth and stones derive their subsistence. And thus, as it appears, they mutually confer on each other generation in a certain circular progression. But since these never appear to be the same, who without being covered with confusion can confidently assert that any one of these is this rather than that? Certainly, no one. Hence it will be far the most safe method of proceeding to speak about them as follows: That the nature which we always perceive becoming something different at different times, such, for instance, as fire, is not fire absolutely, but something fiery. And again, that the nature which we denominate water is not absolutely so, but such-like, or watery; and that it is not at any time any thing else, as if it possessed any liability of essence. And lastly, that they cannot be distinguished by any word, such as we are accustomed to employ when endeavoring to show that any particular is either this thing or that. For they fly away, incapable of sustaining the affirmation which asserts them to be this thing, of such a nature, belonging to this; and all such appellations as would evince them to be something permanent and real. Hence, we ought not to denominate any one of these either this, or that; but something such-like, and a perpetually-revolving similitude. Thus, we should assert that fire is every where such-like, and should speak in the same manner of every thing endued with generation. But we should alone distinguish by the appellations of this, or that, the subject in which each of these appears to be generated, and again to suffer a dissolution. But this subject is by no means to be denominated such-like, as for instance hot or white, or any quality belonging to contraries, or any thing which contraries compose. However, let us endeavor to explain more clearly what we mean to express. For if any one, fashioning all possible figures from gold, should without ceasing transform each figure into all; and if, during this operation, some one who is present should, pointing to one of these figures, inquire what it is; it might most safely, with respect to truth, be replied, that it was gold: but he who should assert that it is a triangle, or any other of the figures which are continually generated, and which ought by no means to be denominated beings, would fall from the truth in the midst of his assertion. But we ought to be content with that answer as most safe, which denominates it such-like, or of such a determinate nature.

In the same manner we should speak concerning that nature which is the general receptacle of all bodies. For it never departs from its own proper power, but perpetually receives all things; and never contracts any form in any respect similar to any one of the intromitted forms. It lies indeed in subjection to the forming power of every nature, becoming agitated and figured through the supernally intromitted forms; and through these it exhibits a different appearance at different times. But the forms which enter and depart from this receptacle are the imitations of perpetually true beings; and are figured by them in a manner wonderful and difficult to describe, as we shall afterwards relate. At present, however, it is necessary to consider three sorts of things: one, that which is generated; another, that in which it is generated; and the third, that from which the generated nature derives its similitude. But it is proper to assimilate that which receives to a mother; that from whence it receives to a father; and the nature situated between these to an offspring. It is likewise necessary to understand that the figured nature can never become distinguished with an all-possible variety of forms, unless its receptacle is well prepared for the purpose, and is destitute of all those forms which it is about to receive. For, if it were similar to any one of the supernally intromitted forms, when it received a nature contrary to that to which it is similar, or any form whatever, it would very imperfectly express its similitude, while at the same time it exhibited the very same appearance with the supernally acceding form. And hence it is necessary, that the receptacle which is destined to receive all possible forms should itself be destitute of every form. Just as those who are about to prepare sweet-smelling unguents, so dispose a certain humid matter as the subject of the ensuing odour, that it may possess no peculiar smell of its own; and as those who wish to impress certain figures in a soft and yielding matter, are careful that it may not appear impressed with any previous figure, but render it as much as possible exquisitely smooth. In the same manner, it is necessary that the subject which is so often destined to receive in a beautiful manner, through the whole of itself, resemblances of eternal beings, should be naturally destitute of all that it receives. Hence, we should not denominate this mother and receptacle of that which is generated, visible and every way sensible, either earth, or air, or fire, or water; nor, again, any one of the composites from these, or any thing from which these are generated: but we should call it a certain invisible species, and a formless universal recipient, which in the most dubious and scarcely explicable manner participates of an intelligible nature. Of itself, indeed, we cannot speak without deception; but so far as it is possible to apprehend its nature from what has been previously said, we may with the greatest rectitude assert as follows: that fire appears to be its inflamed part; water its moist part; and that earth and air are its parts in a similar manner, so far as it receives the imitations of these. But we ought rather thus to inquire about these, distinguishing and separating them by a reasoning process; whether there is a certain fire, itself subsisting in itself; and whether this is the case with all such particulars which we perpetually assert to subsist from themselves; or whether such things alone as are the objects of sight, and which are perceived through the ministry of the body, possess being and truth; so that nothing besides these has in any respect any subsistence; that we in vain assert there is a certain intelligible form of each of these; and that all such forms are nothing but words. Indeed, whether such a doctrine is true or not, must not be asserted rashly and without examination: nor is it proper to add to the present disputation, which is naturally prolix, any thing tedious and foreign from the purpose. But if any definition can be employed in this affair, comprehending things of great moment in a short compass, such a one will be very opportune to our present design. In this manner then I shall relate my opinion on the subject.

If intellect and true opinion are two kinds of things, it is every way necessary that there should be forms, subsisting by themselves, which are not the objects of sense, but which are apprehended by intelligence alone. But if, as appears to some, true opinion differs in no respect from intellect, every thing which is perceived through body is to be considered as possessing the most certain and stable nature. But in reality these ought to be denominated two distinct things, because they are generated separate from each other, and are dissimilar. For the one of these subsists in us through learning, but the other through persuasion. And the one is indeed always attended with true reason, but the other is irrational. The one is not to be moved by persuasion; the other, on the contrary, is subject to this mutation. And lastly, of true opinion every man participates; but of intellect all the Gods, and but a few of mankind. Such then being the case, we must confess that the form which subsists according to same, is unbegotten and without decay; neither receiving any thing into itself externally, nor itself proceeding into any other nature. That it is invisible, and imperceptible by sense; and that this is the proper object of intellectual speculation. But the form which is synonymous and similar to this, must be considered as sensible, generated, always in agitation, and generated in a certain place, from which it again recedes, hastening to dissolution; and which is apprehended by opinion in conjunction with sense. But the third nature is that of place; which never receives corruption, but affords a seat to all generated forms. This indeed is tangible without tangent perception; and is scarcely by a certain spurious reasoning the object of belief. Besides, when we attempt to behold this nature, we perceive nothing but the delusions of dreams, and assert that every being must necessarily be some where, and be situated in a certain place: and we by no means think that any thing can exist, which is neither in the earth nor comprehended by the heavens. All these, and all such opinions as are the sisters of these, we are not able to separate from our cogitation of that which subsists about a vigilant and true nature: and this because we cannot rouse ourselves from this fallacious and dreaming energy, and perceive that in reality it is proper for an image to subsist in something different from itself; since that in which it is generated has no proper resemblance of its own, but perpetually exhibits the phantasm of something else; and can only participate of essence in a certain imperfect degree, or it would become in every respect a perfect non-entity. But to true being, true reason bears an assisting testimony, through the accuracy of its decisions; affirming, that as long as two things are different from each other, each can never become so situated in either, as to produce at the same time one thing, and two things essentially the same.

This, then, is summarily my opinion:—that, prior to the generation of the universe, these three things subsisted in a triple respect, viz. being, place, and generation. And that the nurse of generation, fiery and moist, receiving the forms of earth and air, and suffering such other passions as are the attendants of these, appeared of an all-various nature to the view but because it was neither filled with similar powers, nor with such as are equally balanced, it possessed no part in equilibrium; but through the perfect inequality of its libration it became agitated by these passions, and again through its motion gave agitation to these. But the parts in motion, being separated from each other, were impetuously hurried along in different directions, similar to the agitations and ventilations which take place in the operations of textorial instruments, and such as are employed in the purgation of corn. For in this case the dense and the heavy parts are borne along one way, and the rare and the light are impelled into a different seat. In the same manner, these four natures being agitated by their receptacle tumultuously moving like the instrument of corn, such as were dissimilar became far separated from each other, and such as were similar became again amicably united. And hence they passed into different seats before the universe was from the mixture of these distributed into beautiful order; but at the same time they all subsisted irrationally, and without the limitation of measure.

But when the artificer began to adorn the universe, he first of all figured with forms and numbers fire and earth, water and air, which possessed indeed certain traces of the true elements, but were in every respect so constituted, as it becomes any thing to be from which Deity is absent. But we should always persevere in asserting that Divinity rendered them as much as possible the most beautiful and the best, when they were in a state of existence opposite to such a condition. I shall now, therefore, endeavor to unfold to you the distribution and generation of these by a discourse unusual indeed, but, to you who have trod in all the paths of erudition, through which demonstration is necessarily obtained, perspicuous and plain. In the first place, then, that fire and earth, water and air, are bodies, is perspicuous to every one. But every species of body possesses profundity; and it is necessary that every depth should comprehend the nature of a plane. Again, the rectitude of the base of a plane is composed from triangles. But all triangles originate from two species; one of which possesses one right angle, and the other two acute angles. And one of these contains one right angle distributed with equal sides; but in the other unequal angles are distributed with unequal sides. Hence, proceeding according to assimilative reasons, conjoined with necessity, we shall establish a principle of this kind, as the origin of fire and all other bodies. The supernal principles of these indeed are known to Divinity, and to the man who is in friendship with Divinity.

But it is necessary to relate by what means four most beautiful bodies were produced; dissimilar indeed to each other, but which are able from certain dissolutions into each other to become the sources of each other's generation. For, if we are able to accomplish this, we shall obtain the truth concerning the generation of earth and fire, and of those elements which are situated according to analogy between these. And then we shall not assent to any one who should assert that there are visible bodies more beautiful than these, each of which subsists according to one kind. We must endeavor, therefore, to harmonize the four sorts of bodies excelling in beauty; and to evince by this means that we sufficiently comprehend the nature of these. Of the two triangles indeed the isosceles is allotted one nature, but the oblong or scalene is characterized by infinity. We ought therefore to choose the most beautiful among infinites, if we wish to commence our investigation in a becoming manner. And if any one shall assert that he has chosen something more beautiful for the composition of these, we shall suffer his opinion to prevail; considering him not as an enemy, but as a friend. Of many triangles, therefore, we shall establish one as most beautiful (neglecting the rest); I mean the equilateral, which is composed from three parts of a scalene triangle. To assign the reason of this would indeed require a prolix dissertation; but a pleasant reward will remain for him who by a diligent investigation finds this to be the case. We have, therefore, selected two triangles out of many, from which the body of fire and of the other elements is fabricated; one of which is isosceles, but the other is that which always has its longer side triply greater in power than the shorter.

But that which we formerly asserted without sufficient security, it is now necessary more accurately to define. For it appeared to us, though improperly, that all these four natures were mutually generated from each other: but they are in reality generated from the triangles which we have just described:—three of them, indeed, from one triangle containing unequal sides; but the fourth alone is aptly composed from the isosceles triangle. All of them, therefore, are not able, by a dissolution into each other, to produce from many small things a mighty few, or the contrary. This indeed can be effected by three of them. For, as all the three are naturally generated from one triangle, when the greater parts are dissolved, many small parts are composed from them, receiving figures accommodated to their natures. And again, when the many small parts being scattered according to triangles produce a number of one bulk, they complete one mighty species of a different kind. And thus much may suffice concerning their mutual generation.

It now remains that we should speak concerning the quality of each of their kinds, and relate from what concurring numbers they were collected together. The first species indeed is that which was composed from the fewest triangles, and is the element of that which has its longer side twice the length of the shorter side, which it subtends. But two of these being mutually placed according to the diameter, and this happening thrice, the diameters and the shorter sides passing into the same, as into a centre, hence one equilateral triangle is produced from six triangles. But four equilateral triangles being composed, according to three plane angles, form one solid angle; and this the most obtuse of all the plane angles from which it is composed. Hence, from four triangles of this kind receiving their completion, the first solid species was constituted, distributive of the whole circumference into equal and similar parts. But the second was formed from the same triangles, but at the same time constituted according to eight equilateral triangles, which produced one solid angle from four planes: so that the second body received its completion from the composition of six triangles of this kind. And the third arose from the conjunction of twice sixty elements, and twelve solid angles, each of which having twenty equilateral bases is contained by five plane equilateral triangles. In this manner, then, the other elements generated these. But the isosceles triangle, being constituted according to four triangles, and collecting the right angles at the centre, and forming one equilateral quadrangle, generated the nature of the fourth element. But six such as these being conjoined produced eight solid angles, each of which is harmonized together, according to three plane right angles. Hence the figure of the body thus composed is cubical, obtaining six plane quadrangular equilateral bases. There is also a certain fifth composition, which Divinity employed in the fabrication of the universe, and when he delineated those forms the contemplation of which may justly lead some one to doubt whether it is proper to assert that the number of worlds is infinite or finite;—though indeed to affirm that there are infinite worlds, can only be the dogma of one who is ignorant about things in which it is highly proper to be skilful. But it may with much less absurdity be doubted whether there is in reality but one world, or whether there are five. According to our opinion, indeed, which is founded on assimilative reasons, there is but one world: though some one, regarding in a certain respect other particulars, may be of a different opinion. But it is proper to dismiss any further speculations of this kind.

Let us now, therefore, distribute the four sorts of things which we have generated, into fire, earth, water, and air. And to earth indeed let us assign a cubical form: for earth is the most immovable of all these four kinds, and the most plastic, or adapted to formation, of all corporeal natures. But it is in the most eminent degree necessary that this should be the case with that which possesses the most secure and stable bases. Among the triangles, indeed, established at the beginning, such as are equilateral possess firmer bases than such as contain unequal sides. And hence, among the plane figures composed from each, it will be found that the isosceles is necessarily more stable than the equilateral, and the square than the triangle, both when considered according to parts and to the whole. On this account, by distributing this figure to the earth, we shall preserve an assimilative reason. This will be the case too by assigning to water that figure which is more difficultly movable than the other three; to fire, the most easily movable form; and to air, that figure which possesses a middle nature. Besides this, we should assign the smallest body to fire, the greatest to water, and one of a middle kind to air. And again, the most acute body to fire, the second from this to air, and the third to water. But, among all these, it is necessary that the body which possesses the fewest bases, should be the most easily movable: for, being every way the most acute, it becomes the most penetrating and incisive of all. It is likewise the most light, because composed from the fewest parts. But that which is second to this, possesses these properties in a secondary respect; and that which ranks as the third, in a third gradation. Hence, according to right and assimilative reason, the solid form of the pyramid is the element and seed of fire. But we must assign that form which is second according to generation to air; and that which is the third to water. And it is necessary to consider all these such, with respect to their smallness, that no one of the several sorts can be discerned by us, on account of its parvitude; but that, when many of them are collected together, their bulks become the objects of our perception. And besides this, all these were accurately absolved and harmonized by the Divinity, both as to their multitude, motions, and powers, in such a proportion as the willing and persuaded nature of necessity was able to receive.

But, among all those natures whose kinds we have above related, the following circumstances appear to take place. And first: with respect to earth: when it meets with fire, becoming dissolved by its acuteness, it is borne along; and remains in this dissolved state either in fire, or in the bulk of air, or in that of water—till its parts, associating themselves together, and again becoming mutually harmonized, produce again a body of earth; for it can never pass into another form. But water, when it is distributed into parts by fire or air, when its parts become again collected, produces one body of fire, but two bodies of air. And the sections of air form from one dissolved part two bodies of fire. Again, when fire receives into itself either air or water, or a certain earth, and, being itself small, is moved in many natures; and besides this, when, through opposing, being vanquished by the agitated forms, it becomes broken in pieces, then two bodies of fire coalesce into one form of air. And when air becomes vanquished and separated into parts, then, from two wholes and a half, one whole form of water is produced. But, again, let us consider this matter as follows: When any one of the other forms, becoming invested by fire, is cut by the acuteness of its angles and sides, then, passing into the nature of fire, it suffers no further discerption. For no species is ever able to produce mutation or passivity, or any kind of alteration, in that which is similar and the same with itself: but as long as it passes into something else, and the more imbecil contends with the more powerful, it will not cease to be dissolved.

Again, when the lesser are comprehended in the greater many, and the few being lacerated are extinguished,—if they are willing to pass into the idea of the conquering nature, they cease to be extinguished, and air becomes venerated from fire, and water from air. But if, when this transition is accomplished, the composite opposes any of the other species, the agitated parts will not cease to be dissolved, till, on account of their dissoluble subsistence being every way impelled, they fly to their kindred nature; or being vanquished, and becoming one from many, similar to their vanquisher, they abide with the victor in amicable conjunction. But, in consequence of these passions, they all of them mutually change the receptacles which they once possessed. For the multitude of each kind is distinguished, according to its proper place, through the motion of its recipient seat. But such as become dissimilar to each other are borne along through the agitation to the place of the natures to which they are similar. Such bodies, therefore, as are unmixed, and the first, are generated from such causes as these. But that other genera are naturally inherent in these forms, is owing to the composition of each element; which not only from the first produces a triangle, together with magnitude, but also such things as are greater and less: and this so many in number as there are different kinds in the forms themselves. And hence, these being mingled in themselves, and with each other, produce an infinite variety; which it is proper he should contemplate who is about to employ assimilative reasons in the investigation of nature. He, therefore, who does not apprehend in what manner, and in conjunction with what particulars, the motion and composition of these take place, will find many impediments in the remaining part of this disputation. And these indeed we have already partly discussed; but a part still remains for our investigation.

And, in the first place, motion is by no means willing to reside in smoothness: For it is difficult, or rather impossible, that a thing in motion should subsist without a mover, or a mover without that which is in motion. Hence, it is impossible that these should be at any time equable and smooth. And, in consequence of this, we should always place an abiding nature in smoothness, and motion in that which is unequal and rough. Inequality, indeed, is the cause of roughness: and we have already treated concerning the generation of inequality. But we have by no means explained how the several sorts, being undistributed according to their kinds, cease to be moved and borne along through each other. This, therefore, must be the subject of our present discussion. The circulation then of the universe, since it comprehends the different sorts of things in its circumference, being of a circular form, and naturally defiling to pass into union with itself, compresses all things within its spacious receptacle, and does not suffer a void place any where to subsist. On this account, fire in the most eminent degree penetrates through all things; and air next to this, ranking as the second to fire, on account of the subtility and tenuity of its parts. And the same reasoning must be extended to the other elements, which are posterior to these. For such as are composed from the greatest parts leave also the greatest vacuity in their composition; but, on the contrary, such as are the smallest leave the least vacuity. But the coalition of compression thrusts the small parts into the void spaces of the large; and on this account, the small parts being placed with the large, and the former separating the latter, but the larger being mingled with the smaller, all of them are borne upwards and downwards to their respective places of abode. For each, upon changing its magnitude, changes also its situation. Hence, through these causes the generation of a nature contrary to smoothness being always preserved, affords a perpetual motion of these, both at present and in all future periods of time.

But, in the next place, it is necessary to understand that there are many kinds of fire: as for instance, flame, and that which is enkindled from flame; which burns, indeed, but exhibits no light to the eyes—and which, when the flame is extinguished, abides in the ignited nature. In like manner, with respect to air, one kind is most pure, which is denominated other; but another most turbulent, and at the same time obscure and dark; and after this another nameless kind is produced, through the inequality of the triangles. But, with respect to water, it is in the first place two-fold; one kind of which is humid, but the other fusile. The humid, therefore, through its participating such parts as are small and unequal, becomes movable, both from itself and another, through inequality and the idea of its figure. But that which is composed from large and smooth parts is more stable than this kind of water, and coalesces into a heavy body through smoothness and equality of parts, But through fire entering into and dissolving its composition, in consequence of losing its equability and smoothness, it participates more of a movable nature. Hence, becoming easily agile, driven about by the proximate air, and extended over the earth, it liquefies, which is denominated a purification of bulk, and falls upon the earth, which is called a defluxion. Again, fire flying upwards from hence, since it does not depart into a vacuum, the proximate air being agitated, impels the moist bulk as yet movable into the seats of fire, with which at the same time it mingles itself. But when the bulk becomes collectively thrust downwards, and again receives equability and smoothness of parts, then fire, the artificer of inequality, departing, the whole mass passes into a sameness with itself. And this departure of fire we denominate refrigeration; but the coalition which takes place when fire is absent we call a concretion, and cold rigidity. But among all those which we denominate fusile waters, that which, becoming most dense from the most attenuated and equable parts, is of a uniform kind, and participates a splendid and yellow colour, is that most honoured and valuable possession gold, which is usually impelled through a rock. And a branch of gold, on account of its density most hard and black, is called a diamond. But that which contains parts proximate to gold, which possesses more than one species, surpasses gold in density, and participates but a small and attenuated part of earth, so that it becomes of a harder nature, but from its internally possessing great intervals is lighter;—this is one kind of splendid and concrete waters, and is denominated brass. But when an earthly nature, being mingled with this, is through antiquity separated from other parts of the brass, and becomes of itself conspicuous, it is then denominated rust. In a similar manner other particulars of this nature may be investigated without much labour by the assistance of assimilative reasons. And if any one, for the sake of relaxation, omitting for a while the speculation of eternal beings, should pursue the assimilative arguments concerning generation, and should by this means possess a pleasure unattended with repentance, such a one will establish for himself in life a moderate and prudent diversion.

This being admitted, let us run over the assimilative reasons concerning the particulars which yet remain for discussion When such water then as is attenuated and moist is mingled with fire, (being denominated moist through its motion and rolling progression on the earth, and likewise soft, because its bases being less stable than those of earth easily yield to impulsion,) this, when separated from fire and deserted by air, becomes more equable, and through the departure of these is compelled into itself: and being thus collected, if it suffers this alteration above the earth, it becomes hail; but if upon the earth, ice; which then takes place in consequence of extreme congelation. But when it is less congealed, if this happens above the earth, it becomes snow; but when upon the earth, and this from collected dew, it then becomes frost. But when many species of water are mingled with each other, the whole kind, which is strained from the earth through plants is called moisture or liquor. These liquors, being dissimilar on account of their mixtures, exhibit many other nameless kinds: but four, which are of a fiery species, and which become in an eminent degree diaphanous, are allotted appellations. And that which heats the soul in conjunction with the body is called wine. But that which is smooth, and segregative of the sight, and on this account splendid, refulgent, and unctuous to the view, is an oleaginous species, and is pitch, gum, oil, and other things endued with a similar power. Again, that which possesses a power of diffusing the things collected about the mouth, and this as far as nature will permit, at the same time bringing sweetness with its power, is generally denominated honey. And lastly, that which dissolves the flesh by burning, is of a frothy nature, and is secreted from all liquors, is called juice. But the species of earth strained through water produces a stony body in the following manner:—When collected water fails in mingling, it passes into the form of air; but, becoming air, it returns to its proper place. Hence, as there is no vacuum, it impels the proximate air; and this, if the impulsion is weighty, being poured round the bulk of earth, becomes vehemently compressed, and betakes itself to those seats from whence the new air ascended. But earth, when indissolubly associated with water, through the ministry of air composes stones: the more beautiful sort indeed being such as are resplendent from equal and plane parts, but the deformed being of a contrary composition. But when all the moisture is hurried away by the violence of fire, and the body by this means becomes more dry, then a species of earth which is denominated fictile is produced. Sometimes, likewise, when the moisture is left behind, and the earth becomes fusile through fire, then through refrigeration a stone with a black colour is generated. But when this species of strained earth in a similar manner through mixture is deprived of much moisture, but is composed from more attenuated parts of earth, is salt and semiconcrete, and again emerges through water; then it is partly called nitre, a cathartic kind of oil, and earth, and partly salt, a substance most elegantly and legitimately adapted to the common wants of the body, and most grateful to divinity. But the parts common to both these are not soluble by water, but through some such thing are thus collected together by fire. Again, fire and air do not liquefy the bulk of earth. For since these naturally consist of parts smaller than the void spaces of earth, they permeate through its most capacious pores without any violence, and neither subject it to dissolution nor liquefaction. But the parts of water, because they are greater and pass along with violence, dissolve and liquefy the mass of earth. Hence, water alone dissolves earth when violently composed, but fire alone when it is properly composed; for an entrance in this case is afforded to nothing but fire.

Again, fire alone permeates the most violent association of the parts of water; but both fire and air diffuse themselves through its more debile collection; air through its void, and fire through its triangular spaces. But nothing is capable of dissolving air when collected, together by violence, except it operates according to an element: but when it coheres together without force, it is resolved by fire alone. Again, bodies which are so composed from water and earth that the water compressed by force obstructs the void spaces of earth, cannot in this case afford an ingress to the water externally approaching; and in consequence of this, the water flowing round such a body suffers the whole mass to remain without liquefaction. But the parts of fire entering into the void spaces of water, as water into those of earth, and influencing water in the same manner as fire influences air, become in this case the causes of liquefaction to a common body. But these partly possess less water than earth; such as the whole genus of glass, and such stones as are denominated fusile: and partly, on the contrary, they possess more of water; such as all those bodies which coalesce into waxen and vaporisic substances. And thus we have nearly exhibited all those species, which are varied by figures, communications and mutations into each other; but it is now necessary that we should endeavor to render apparent the causes through which the passions of these are produced.

In the first place, then, sense ought always to be present with discourses of this kind. But we have not yet run through the generation of flesh, and such things as pertain to flesh, together with that part of the soul which is mortal. For all these are inseparable from the passions subsisting with sense, and cannot without these passions be sufficiently explained; though, indeed, even in conjunction with these, it is scarcely possible to unfold their production. We should, therefore, first of all establish other things; and then consider such things as are consequent to these. That in our disputation, therefore, the passions themselves may follow the genera in succession, let our first investigations be concerning such things as pertain to body and soul. Let us then first of all inquire why fire is called hot. And the reason of this we shall be able to perceive by considering the separation and division of fire about our bodies: for that this passion is a certain sharpness is nearly evident to all. But we ought to consider the tenuity of its angles, the sharpness of its sides, the smallness of its parts, and the velocity of its motion, through all which it becomes vehement and penetrating, and swiftly divides that with which it meets; calling to mind for this purpose the generation of its figure. For fire, indeed, and no other nature, separating our bodies and distributing them into small parts, produces in us that passion which is very properly denominated heat. But the passion contrary to this, though sufficiently manifest, ought not to pass without an explanation. For the moist parts of bodies larger than our humid parts, entering into our bodies, expel the smaller parts; but, not being able to penetrate into their receptacles, coagulate our moisture, and cause it through equability to pass from an unequable and agitated state into one immovable and collected. But that which is collected together contrary to nature, naturally opposes such a condition, and endeavors by repulsion to recall itself into a contrary situation. In this contest and agitation a trembling and numbness takes place; and all this passion, together with that which produces it, is denominated cold. But we call that hard to which our flesh gives way; and soft, which yields to the pressure of our flesh. And we thus denominate them with reference to each other. But every thing yields to pressure which is established on a small base. But that which rests on triangular bases, on account of its being vehemently firm, is of a most resisting nature; and, because it is dense in the highest degree, strongly repels all opposing pressure.

Again, the nature of heavy and light will become eminently apparent, when investigated together with upwards and downwards. But indeed it is by no means rightly asserted that there are naturally two certain places distant by a long interval from each other: one denominated downwards, to which all bodies tend endued with bulk, but the other upwards, to which every thing is involuntarily impelled. For, the whole universe being spherical, all such things as by an equal departure from the middle become extremes, ought to become naturally extremes in a similar manner. But the middle, being separated from the extremes according to the same measures, ought to be considered as in a situation just opposite to all things. Such, then, being the natural disposition of the world, he who places any one of the above-mentioned particulars either upwards or downwards, will justly appear by such appellations to wander from the truth. For the middle place in the universe cannot be properly called either naturally downwards or upwards, but can only be denominated that which is the middle. But that which environs is neither the middle, nor contains any parts in itself differing from each other with reference to the middle, nor does it possess any thing corresponding to an opposite direction. But to that which is every way naturally similar how can any one with propriety attribute contrary names? For, if there be any thing solid, and endued with equal powers, in the middle of the universe, it will never tend to any part of the extremities, through the perfect similitude which they every where possess. But if any one moves about this solid in a circle, he will often stand with his feet in opposite directions, and will denominate the same part of himself both upwards and downwards. Since the universe, therefore, as we have just observed, is of a spherical figure, it is not the part of a prudent man to assert that it has any place which is either upwards or downwards. But from whence these names originate, and, in what things existing, we transfer them from thence to the universe, it is our business at present to investigate. If any one then should be seated in that region of the world which for the most part belongs to the nature of fire, and to which it on all sides tends, and if such a one should acquire a power of taking away the parts of fire, and of causing them to balance; or, placing the parts in a scale, should violently seize on the beam, and, drawing out the fire, hurl it downwards into dissimilar air—it is evident that in this case a less portion of fire would be more easily compelled than a greater. For, when two things are at the same time suspended from one power, it is necessary that the less quantity should more easily, and the greater with less readiness, yield to the oppressive force. Hence, the one is called heavy, and tending downwards; but the other light, and tending upwards. The same thing happens to us who inhabit this terrestrial region. For, walking on the earth, and separating the terrene genera from each other, we sometimes violently hurl a fragment of earth into its dissimilar the air, and this with a motion contrary to its nature; each region at the same time retaining that to which it is allied. But the less portion, being more easily impelled into a dissimilar place than the larger, first of all yields to the violence: and this we denominate light, and call the place into which it is violently hurled, upwards.

But the passion contrary to this we denominate heavy and downwards. Hence it is necessary that these should mutually differ from each other; and this through the multitude of genera obtaining contrary situations. For that which is light in one place is contrary to that which is light in a contrary situation: likewise the heavy to the heavy, the downward to the downward, and the upward to the upward. For all these will be found to be contrary, transverse, and every way different from each other. One thing however is to be understood concerning all these, that the progression of each, tending to its kindred nature, renders the proceeding body heavy, and the place to which it tends, downwards. But this progression influences in a different manner such as are differently affected. And thus have I unfolded the causes of these passions.

But again, any one who beholds the cause of the passion of smoothness and roughness may be able to disclose it to others. For hardness mingled with inequality produces the one, and equality with density the other. But among the common passions which subsist about the whole body, that is the greatest which is the cause of pleasure and pain: to which may be added, such as through the parts of the body detain the senses, and have in these pleasures and pains as their attendants. In this manner, then, we should receive the causes of every passion, both sensible and insensible, calling to mind the distinctions which we formerly established concerning the easily and difficultly movable nature. For in this manner we ought to pursue all such things as we design to apprehend. Thus, with respect to that which is naturally easily movable, when any slender passion falls upon it, the several parts give themselves up to each other in a circular progression, producing the same effect; till, having arrived at the seat of prudence, they announce the power of that by which the passion was induced. But that which is affected in a contrary manner, being stable and without a circular progression, alone suffers; but does not move any of the parts to which it is proximate. Hence, the parts not mutually giving themselves up to each other, and the first passion in them becoming immovable with respect to the whole animal, that which suffers is rendered void of sensation. This last case indeed happens about the bones and hairs, and such other parts of our composition as are mostly terrene. But the circumstances belonging to the easily movable nature take place about the instruments of sight and hearing, through their containing the most abundant power of fire and air. But it is necessary to consider the peculiarities of pleasure and pain as follows:—When a passion is produced in us contrary to nature, and with violence and abundance, then it becomes the occasion of pain. And again, when a passion conformable to our nature is excited, and this with abundance, it causes pleasure and delight. But that which is contrary to these produces contrary effects. But a passion, the whole of which is induced with great facility, is eminently indeed the object of sensation, but does not participate of pleasure and pain. And of this kind are the passions subsisting about the sight; to which, as we have above asserted, our body is allied. For such objects as exhibit sections and burnings, and other passions of a similar kind, do not cause pain to the sight; nor, again, does the sight receive pleasure when it is restored to the same form as before. But the most vehement and clear sensations influence it with pain, so far as it suffers any thing, strikes against, or comes into contact with, any object. For no violence subsists in the separation or concretion of the sight. But such bodies as are composed from larger parts, and which scarcely yield to impulsion, when they transfer the induced motions to the whole body, contain in themselves pleasures and pains; when varied, indeed, pains, but, when restored to their pristine situation, pleasures. Again, whatever bodies in a small degree receive departures and evacuations of themselves, accompanied at the same time with abundant repletions,—since such bodies have no sense of evacuation, but are sensible of repletion, they do not affect the mortal part of the soul with any pain, but, on the contrary, influence it with the greatest delight. And the truth of this is manifest from the sensation of sweet odours. But such bodies as suffer an abundant variation, and are scarce able to be restored in a small degree to their pristine situation, are totally affected in a manner contrary to those we have just described. And the truth of this is manifest in the burnings and sections of the body. And thus have we nearly discussed the common passions of the whole body, and the appellations assigned to the causes by which they are produced.

Let us now endeavor to explain those passions which take place in particular parts of our bodies, and relate from whence they arise, and by what causes they are induced. In the first place, let us if possible complete what we formerly left unfinished concerning humours; since these are passions subsisting about the tongue. But these, as well as many other things, appear to be produced by certain separations and concretions; and, besides this, to employ smoothness and roughness more than the rest. For certain small veins extend themselves from the tongue to the heart, and are the messengers of tastes. And when any thing falls upon these so as to penetrate the moist and delicate texture of the flesh, which through its terrestrial nature is moderately liquefied, it then contracts and dries the veins. Hence, if these penetrating substances are of a more rough nature, they produce a sharp taste; but, if less rough, a sour taste. But such things as are purgative of these veins, and which wash away whatever is found adhering to the tongue, if they accomplish this in an immoderate degree, so as to liquefy something of the nature of the tongue, such as is the power of nitre;—all such as these are denominated bitter. But whatever is subordinate to this property of nitre, and purges in a more moderate degree, appears to us to be salt, without the roughness of bitterness, and to be more friendly to our nature. Again, such things as, communicating with the heat of the mouth, and being rendered smooth by it, heat also in their turn the mouth—and which through their lightness are elevated towards the senses of the head, at the same time dividing whatever they meet with in their ascent;—all these, through powers of this kind, are denominated sharp. But sometimes these several particulars, becoming attenuated through rottenness, enter into the narrow veins, and compel the interior parts, as well the terrene as those containing the symmetry of air, to be mingled together by moving about each other; and when mingled cause some of the parts to glide round, some to enter into, others, and when entered to render them hollow and extended; and this in the place where a hollow moisture is extended about the air. This moisture too being at one time terrene and at another pure, a moist orbicular receptacle of air is produced from the hollow water. But that which is produced from pure water is on all sides diaphanous, and is called a bubble. On the contrary, that which owes its subsistence to a more earthly moisture, and which is at the same time agitated and elevated, is denominated fervid, and a fermentation. But the cause of all these passions receives the appellation of acute. And a passion contrary to all that has been asserted concerning these proceeds from a contrary cause. But when the composition of the things entering into moist substances is naturally accommodated to the quality of the tongue, it polishes and anoints its asperities, and collects together or relaxes such parts as were either assembled or dissipated contrary to nature, and restores them to their proper and natural habit. Hence, all such substances are pleasant and friendly to every one, become the remedies of violent passions, and are denominated sweet. And thus much may suffice concerning particulars of this kind.

There are, however, no species about the power of the nostrils: for all odours are but half begotten. But it happens to no species to be commensurate with any odour. And our veins, with respect to particulars of this kind, are too narrow to admit the genera of earth and water, and too broad to receive those of fire and air; and hence no one ever perceives an odour of any one of these. But odours are always produced from the madefaction, corruption, liquefaction or evaporation of the elements. For, water becoming changed into air, and air into water, odours are generated in the middle of these. And all odours are either smoke or mists. But, of these, that which passes from air into water is a mist; but that which is changed from water into air, smoke. And hence it comes to pass that all odours are more attenuated than water, and more dense than air. But the truth of this is sufficiently evident when any one, in consequence of a disagreeable smell, violently draws his breath inwards; for then no odour is washed off, but breath alone follows unattended by smell. On this account, the varieties of these subsist without a name; as they are neither composed from many nor from simple species. But two of these alone receive an appellation, the pleasant and the disagreeable: the latter of which disturbs and violently assaults all that cavity which lies between the top of the head and the navel; but the former allures this part of the body, and by its amicable ingress preserves it in a condition accommodated to its nature. But we ought to consider the third sensitive part of our composition, hearing, in such a manner that we may explain through what causes the passions with which it is conversant subsist. We ought, therefore, entirely to desire voice a certain pulsation of the air, penetrating through the ears, brain, and blood, as far as to the soul: and we should call the motion arising from hence, which commences from the head and ends in the seat of the liver, hearing. When this motion is swift, a sharp sound is produced; but, when slow, a flat sound. And the former of these is equal and smooth, but the latter rough. Many voices too produce a great sound, but a small sound is the result of a few. But it is necessary that we should speak about the symphonies of these in the subsequent part of this discourse. The fourth sensitive genus now remains for our discussion; which contains in itself an abundant variety, all which are denominated colours. But colour is a flame flowing from bodies, and possessing parts commensurate to the sight with respect to perception. But we have already considered the causes from which sight is produced. It appears then that we may now speak of colours according to assimilative reasons as follows:

Of things which, proceeding from other parts, fall on the sight, some are greater, others less, and others equal to the parts of the sight. Such as are equal, therefore, cannot be perceived; and these we denominate diaphanous. But, among such as are larger or smaller, some of these separate, but others mingle the sight, similar to the operations of heat and cold about the flesh, or to things four, acute and hot about the tongue. But things which affect, the sight in this manner are called black and white; which are indeed the passions of those particulars we have just related, being their sisters, as it were, and the same with them in a different genus; but which, nevertheless, through these causes appear to be different. We should, therefore, speak of them as follows:—That the colour which is segregative of the light is white; but that which produces an effect contrary to this, black. But when a more acute motion, and of a different kind of fire, falls upon and separates the sight, as far as to the eyes, at the same time violently propelling and liquefying the transitions of the eyes, then a collected substance of fire and water flows from thence, which we denominate a tear; but the motion itself is a fire meeting with the sight in an opposite direction. And, indeed, when a fire, leaping as it were from a certain coruscation, becomes mingled with another fire, penetrating and extinguished by moisture, from this mixture colours of all-various kinds are produced. In this case we call the passion a vibrating splendour, and that which produces it fulgid and rutilating. But a kind of fire which subsists in the middle of these, arriving at the moisture of the eyes, and becoming mingled with it, is by no means splendid: but in consequence of the rays of fire being mingled through moisture, and producing a bloody colour, we denominate the mixture red. And when splendour is mingled with red and white, it generates a yellow colour. But to relate in what measure each of these is mingled with each, is not the business of one endued with intellect, even though he were well informed in this affair; since he would not be able to produce concerning these either a necessary or an assimilative reason. But red, when mingled with black and white, produces a purple colour. And when to these, mingled and burnt together, more of black is added, a more obscure colour is produced. A ruddy colour is generated from the mixture of yellow and brown; but brown from the mixture of black and white. A pallid colour arises from the mingling of white and yellow. But that which is splendid conjoined with white, and falling upon abundance of black, gives completion to an azure colour. And azure mingled with white generates a gray colour. But from the temperament of a ruddy colour with black, green is produced. All the rest, will be nearly evident from these, to any one who, imitating the former mixtures, preserves assimilative reasons in his discourse. But if any one undertakes the investigation of these, for the sake of the things themselves, such a one must be ignorant of the difference between a divine and human nature: since a God is indeed sufficient for the purpose of mingling many things into one, and of again dissolving the one into many, as being at the same time both knowing and able: but there is no man at present who is able to accomplish either of these undertakings, nor will there ever be one in any future circulation of time. But all these which thus naturally subsist from necessity, were assumed in the things which are generated by the artificer of that which is most beautiful and best, when he produced a self-sufficient and most perfect God; employing, indeed, causes which are subservient to these, but operating himself in the best manner in all generated natures. On this account it is requisite to distinguish two species of causes; the one necessary, but the other divine. And we should inquire after the divine cause in all things, for the sake of obtaining a blessed life in as great a degree as our nature is capable of receiving it; but we should investigate the necessary cause for the sake of that which is divine. For we should consider, that without these two species of causes, the objects of our pursuit can neither be understood nor apprehended, nor in any other way become participated. But since to us at present, as to artificers, matter lies in subjection, the genera, of causes serving as prepared materials from which the remaining discourse is to be woven, let us again return with brevity to our first discussions, and swiftly pass from thence to the place at which we are now arrived; by this means endeavoring to establish an end and summit to our disputation, which may harmonize with its beginning.

Indeed, as we asserted towards the commencement of our discourse, when all sensible natures were in a disordered state of subsistence, Divinity rendered each commensurate with itself, and all with one another, and connected them as much as possible with the bands of analogy and symmetry. For then nothing participated of order except by accident; nor could any thing with propriety be distinguished by the appellation which it receives at present, such for instance as fire, water, and the rest of this kind. But the demiurgus in the first place adorned all these, afterwards established the world from their conjunction, and rendered it one animal, containing in itself all mortal and immortal animals. And of divine natures, indeed, he himself became the author; but he delivered to his offspring the junior Gods the fabrication of mortal natures. Hence, these imitating their father's power, and receiving the immortal principle of the soul, fashioned posterior to this the mortal body, assigned the whole body as a vehicle to the soul, and fabricated in it another mortal species of soul, possessing dire and necessary passions through its union with the body. The first indeed of these passions is pleasure, which is the greatest allurement to evil; but the next is pain, which is the exile of good. After these follow boldness and fear, those mad advisers; anger, hard to be appeased; hope, which is easily deceived; together with irrational sense, and love, the general invader of all things. In consequence, therefore, of mingling these together, the junior Gods necessarily composed the mortal race. And religiously fearing lest the divine nature should be defiled through this rout of molestations more than extreme necessity required, they lodged the mortal part, separate from the divine, in a different receptacle of the body; fabricating the head and breast, and placing the neck between as an isthmus and boundary, that the two extremes might be separate from each other.

In the breast, therefore, and that which is called the thorax, they seated the mortal genus of the soul. And as one part of it is naturally better, but another naturally worse, they fabricated the cavity of the thorax; distributing this receptacle in the woman different from that of the man, and placing in the middle of these the midriff or diaphragm. That part of the soul, therefore, which participates of fortitude and anger, and is fond of contention, they seated nearer the head, between the midriff and the neck; that becoming obedient to reason, and uniting with it in amicable conjunction, it might together with reason forcibly repress the race of desires, whenever they should be found unwilling to obey the mandates of reason, issuing her orders from her lofty place of abode. But they established the heart, *which is both the fountain of the veins, and of the blood, which is vehemently impelled through all the members of the body in a* CIRCULAR PROGRESSION, in an habitation corresponding to that of a satellite; that when the irascible part becomes inflamed, reason at the same time announcing that some unjust action has taken place externally, or has been performed by some one of the inward desires, then every thing sensitive in the body may swiftly through all the narrow pores perceive the threatenings and exhortations, may be in every respect obedient, and may thus permit that which is the best in all these to maintain the sovereign command.

But as the Gods previously knew that the palpitation of the heart in the expectation of dreadful events, and the effervescence of anger, and every kind of wrathful inflation, would be produced by fire, they implanted in the body the idea of the lungs, artificially producing them as a guardian to the heart. And, in the first place, they rendered them soft and bloodless, and afterwards internally perforated with hollow pipes like a sponge; that through their receiving spirit and imbibing moisture, they might become themselves refrigerated, and might afford respiration and remission to the heart in its excessive heat. Hence they deduced the arteries as so many canals through the substance of the lungs; and placed the lungs like a soft thicket round the heart, that when anger rages in it with too much vehemence it may leap into submission, and becoming refrigerated may be subject to less endurance, and may be able together with anger to yield with greater facility to the authority of reason. But they seated that part of the soul which is desiderative of meats and drinks, and such other things as it requires through the nature of body, between the præcordia and the boundary about the navel; fabricating all this place as a manger subservient to the nutriment of the body, and binding in it this part of the soul as a rustic and savage animal. But it is necessary that this part should nourish its conjoined body, if the mortal race has a necessary existence in the nature of things. That this part, therefore, might be always fed at the manger, and might dwell remote from the deliberative part, molesting it in the smallest degree with its tumults and clamours, and permitting it, as that which is most excellent in our composition, to consult in quiet for the common utility of the whole animal; on this account the Gods assigned it such a subordinate situation.

However, as the Divinity perceived that this part would not be obedient to reason, but that it would naturally reject its authority in consequence of every sensible impression, and would be animastically hurried away by images and phantasms both by day and night—considering this, he constituted the form of the liver, and placed it in the habitation of this desiderative part; composing it dense and smooth, splendid and sweet, and at the same time mingled with bitterness; that the power of cogitations, descending from intellect into the liver as into a mirror receiving various resemblances and exhibiting images to the view, might at one time terrify this irrational nature by employing a kindred part of bitterness and introducing dreadful threats, so that the whole liver being gradually mingled might represent bilious colours, and becoming contracted might be rendered throughout wrinkled and rough; and that, besides this, it might influence its lobe, ventricle, and gates, in such a manner, that by distorting and twisting some of these from their proper disposition, and obstructing and shutting in others, it might be the cause of damages and pains. And again, that at another time a certain inspiration of gentleness from the dianoëtic power, by describing contrary phantasms and affording rest to bitterness, through its being unwilling either to excite or apply itself to a nature contrary to its own; and besides this, by employing the innate sweetness of the liver, and rendering all its parts properly disposed, smooth, and free, might cause that part of the soul which resides about the liver to become peaceful and happy, so that it might even refrain from excess in the night, and employ prophetic energies in sleep: since it does not participate of reason and prudence. For those who composed us, calling to mind the mandate of their father, that they should render the mortal race as far as possible the best, so constituted the depraved part of our nature that it might become connected with truth; establishing in this part a prophetic knowledge of future events. But that Divinity assigned divination to human madness may be sufficiently inferred from hence; that no one while endued with intellect becomes connected with a divine and true prophecy; but this alone takes place either when the power of prudence is fettered by sleep, or suffers some mutation through disease, or a certain enthusiastic energy: it being in this case the employment of prudence to understand what was asserted either sleeping or waking by a prophetic and enthusiastic nature; and so to distinguish all the phantastic appearances as to be able to explain what and to whom any thing of future, past, or present good is portended. But it is by no means the office of that which abides and is still about to abide in this enthusiastic energy, to judge of itself either concerning the appearances or vociferations. Hence it was well said by the antients, that to transact and know his own concerns and himself, is alone the province of a prudent man. And on this account the law orders that the race of prophets should preside as judges over divine predictions; who are indeed called by some diviners—but this in consequence of being ignorant that such men are interpreters of ænigmatical visions and predictions, and on this account should not be called diviners, but rather prophets of divinations. The nature, therefore, of the liver was produced on this account, and seated in the place we have mentioned, viz. for the sake of prediction. And besides this, while each of such like parts is living, it possesses clearer indications; but when deprived of life it then becomes blind, and the divination is rendered too obscure to signify any thing sufficiently clear. But an intestine which subsists for the sake of the liver, is placed near it on the left hand, that it may always render the liver splendid and pure, and prepared like a mirror for the apt reception of resemblant forms. On this account, when certain impurities are produced about the liver through bodily disease, then the spleen, purifying these by its rarity, receives them into itself from its being of a hollow and bloodless contexture. Hence, being filled with purgations, it increases in bulk, and becomes inflated with corruption. And again, when the body is purified, then becoming depressed it subsides into the same condition as before. And thus we have spoken concerning both the mortal and divine part of the soul, and have related where they are situated, in conjunction with what natures, and why they are separated from each other. That all this indeed is unfolded according to indisputable truth, can only be asserted when confirmed by the vocal attestation of a God: but that it is spoken according to assimilative reasons, we should not hesitate to evince both now and hereafter by a more diligent discussion of what remains.

It is proper to investigate in a similar manner the subsequent part of our disputation; and this is no other than to relate how the other members of the body were produced. It is becoming, therefore, in the most eminent degree that they should be composed as follows: Those artificers then of our race well knew that we should be intemperate in the assumption of meats and drinks, and that we should often through gluttony use more than was moderate and necessary. Hence, lest sudden destruction should take place through disease, and the mortal race thus becoming imperfect should presently cease to exist; the Gods previously perceiving this consequence, fabricated in the lower parts a hollow receptacle for the purpose of receiving a superabundance of solid and liquid aliment; and, besides this, inverted it with the spiral folds of the intestines, lest, the assumed nutriment swiftly passing away, the body should as swiftly require an accession of new aliment; and, by producing an insatiable appetite through gluttony, should render our whole race void of philosophy and the Muses, and unobedient to the most divine part of our composition. But the nature of the bones and flesh, and other things of this kind, was constituted as follows: In the first place, the generation of the marrow serves as a principle to all these. For the bonds of that life which the soul leads through its conjunction with the body, being woven together in the marrow, become the stable roots of the mortal race. But the marrow itself is generated from other particulars. For, among the triangles, such as are first, being unbent and smooth, were particularly accommodated to the generation of fire and water, air and earth; and the Divinity separating each of these apart from their genera, and mingling them commensurate with each other, composing by this means an all-various mixture of seeds for the mortal race, produced from these the nature of the marrow. But afterwards disseminating in the marrow, he bound in it the genera of souls. Besides, in this first distribution, he immediately separated as many figures and of such kinds as it was requisite the marrow should possess. And he fashioned indeed that part of the marrow in which as in a cultivated field the divine seed was to be sown, every way globular, and called it εγκεφαλον, or the brain; because in every animal, when it has acquired the perfection of its form, the receptacle of this substance is denominated the head. But he distinguished with round and at the same time oblong figures, that receptacle of the body which was destined to contain the remaining and mortal part of the soul; and was willing that the whole should receive the appellation of marrow. And besides this, hurling from these as anchors the bonds of all the soul, he fabricated the whole of our body about the substance of the marrow, and inverted it on all sides with a covering of bones.

But he thus composed the nature of the bones. In the first place, bruising together pure and smooth earth, he mingled and moistened it with marrow; after this he placed it in fire, then merged it in water, then again seated it in fire, and after this dipped it in water. And thus, by often transferring it into each, he rendered it incapable of being liquefied by both. Employing therefore this nature of bone, he fashioned like one working with a wheel a bony sphere, and placed it round the brain; leaving a narrow passage in the sphere itself. And besides this, forming certain vertebræ from bone about the marrow of the neck and back, he extended them like hinges, commencing from the head and proceeding through the whole cavity of the body. And thus he preserved all the seed, by fortifying it round about with a stony vestment. He likewise added joints, for the purpose of motion and inflection, employing the nature of that which is distinguished by difference in their fabrication, as this is endued with a certain middle capacity. But, as he thought that the habit of the bony nature would become more dry and inflexible than it ought to be, and that, when it became heated and again cooled, it would in consequence of ulceration swiftly corrupt the seed which it contained, on this account he fashioned the genus of nerves and flesh; that the nerves, by binding all the other members, and becoming stretched and remitted about those hinges the vertebrae, might render the body apt to become inflected and extended as occasion required: but that the flesh might serve as a covering from the heat and a protection from the cold; and, besides this, might defend it from falls, in the same manner as external supports, gently and easily yielding to the motions of the body. He likewise placed a hot moisture in the nature of the flesh, that, becoming in summer externally dewy and moist, it might afford a kindred refrigeration to the whole body; and that again in winter, through its own proper fire, it might moderately repel the externally introduced and surrounding cold. When, therefore, the plastic artificer of our bodies had perceived all this through a dianoëtic energy, having mingled and harmonized together water, fire, and earth, and added to the mixture a sharp and salt ferment, he gradually composed soft and succulent flesh.

But he mingled the nature of the nerves from bone and unfermented flesh, composing one middle substance from the power of both, and tingeing it with a yellow colour. And on this account it comes to pass that the power of the nerves is more intense and viscous than that of the flesh, but more soft and moist than that of the bones. Hence, the Divinity bound the bones and marrow to each other with the nerves, and afterwards inverted them all supernally with the flesh, as with a dark concealing shade. Such of the bones, therefore, as were the most animated he covered with the least flesh; but such as were the least animated he inverted with flesh the most abundant and dense. And, besides this, he added but a small quantity of flesh to the joints of the bones, except where reason evinces the necessity of the contrary: and this lest they should be a hindrance to the inflections, and retard the motions of the body; and again, lest in consequence of their being many and dense, and vehemently compressed in one another, they should cause through their solidity a privation of sense, a difficulty of recollection, and a remission of the dianoëtic energy. On this account he inverted with abundance of flesh the bones of the groin, legs, loins, the upper part of the arms, and that part which extends from the elbow to the wrist, and such other parts of our bodies as are without articulation, together with such inward bones as through the paucity of soul in the marrow are destitute of a prudential energy. But he covered with a less quantity of flesh such bones as are endued with prudence: unless, perhaps, the fleshy substance of the tongue, which was produced for the sake of sensation, is to be excepted. In other parts, the case is such as we have described. For a nature which is generated and nourished from necessity can by no means at one and the same time receive a dense bone and abundant flesh, united with acuteness of sensation. But this would be most eminently the case with the composition of the head, if all these were willing to coalesce in amicable conjunction: and the human race, possessing a fleshy, nervous, and robust head, would enjoy a life twice as long, or still more abundantly extended, healthy and unmolested, than that which we at present possess.

Again, in consequence of those artificers of our generation considering whether they should fabricate our race possessing a life more lasting indeed but of a worse condition, or of a shorter extent but of a more excellent condition, it appeared to them that a shorter but more excellent life was by all means to be preferred to one more lasting but of a subordinate condition. Hence they covered the head with a thin bone, but did not invert it with flesh and nerves, because it was destitute of inflections. On all these accounts, therefore, the head was added to the body as the most sensitive and prudent, but at the same time by far the most imbecil part of all the man. But through these causes, and in this manner, the Divinity placing the nerves about the extreme part of the head, conglutinated them in a circle about the neck, (after a certain similitude), and bound with them those lofty cheekbones situated under the countenance; but he disseminated the rest about all the members, connecting joint with joint. Besides, those adorners of our race ornamented us with the power of the mouth, teeth, tongue, and lips, and this for the sake of things which are at the same time both necessary and the best; producing ingression for the sake of necessaries, but egression for the sake of such as are best. Every thing, indeed, which being introduced affords nutriment to the body, is necessary; but the stream of words flowing forth externally, and becoming subservient to prudence, is the most beautiful and best of all effluxion? Besides, it was not possible that the head could remain without any other covering than that of a naked bone, through the extremities of heat and cold in the different seasons; nor, again, could it become the instrument of knowledge when invested with darkness, dulled, and without sensation, through the perturbation of flesh. Hence, a part of a fleshy nature, not entirely dried, and surpassing the residue, was separated from the rest; and which is now denominated a membrane. This membrane passing into union with itself, and blossoming about the moisture of the brain, circularly invests the head. But the moisture flowing under the sutures of the head irrigates this membrane, and, causing it to close together at the crown, connects it, as it were, in a knot. But an all-various species of futures is generated through the power of the circulations and the nutriment; the variety becoming greater when these oppose each other with greater violence, but less when they are in a state of less opposition. All this membrane the divine artificer of our bodies circularly pierced with fire. And hence, becoming as it were wounded, and the moisture externally flowing through it, whatever is moist, hot, and pure, passes away; but whatever is mingled from the same natures as the membrane itself, this, in consequence of receiving an external production, becomes extended into length, and possesses a tenuity equal to the punctuation of the membrane. But this substance, from the slowness of its motion, being continually thrust back by the externally surrounding spirit, again revolves itself under the membrane, and there fixes the roots of its progression. Hence, from these passions the race of hairs springs up in the membrane of the head, being naturally allied to, and becoming, as it were, the reins of this membrane, at the same time that they are more hard and dense through the compression of cold. For every hair, when it proceeds beyond the membrane, becomes hardened through cold. After this manner, then, the artificer planted our head with hairs, employing for this purpose the causes which we have mentioned.

But at the same time he understood by a dianoëtic energy, that instead of flesh a light covering was necessary for the security of the brain; which might sufficiently shade and protect it like a garment from the extremities of heat and cold, but by no means hinder the acuteness of sensation. But that comprehension of nerve, skin, and bone about the fingers, being a mixture of three substances, and becoming of a drier nature, produced one common hard membrane from the whole. These indeed were the ministrant causes of its fabrication; but the most principal cause consists in that cogitation which produced this membrane for the sake of future advantage. For those artificers of our nature well knew that at some time or other women and other animals would be generated from men; and that nails would be of the greatest advantage in many respects to the bestial tribes. Hence they impressed in men the generation of nails, at the very period of their production. But from this reason, and through these causes, they planted the skin, hairs, and nails in the members situated at the extremities of the body. However, as all the parts and members of a mortal animal were generated in alliance with each other, and necessarily possessed their life in the union of fire and spirit, lest the animal becoming resolved and exhausted by these should swiftly decay, the Gods devised the following remedy:—For mingling a nature allied to the human with other forms and senses, they planted, as it were, another animal; such as those mild trees, plants, and seeds, which, being now brought to perfection through the exercise of agriculture, are friendly to our nature; though prior to this they were of a rustic kind, being more antient than such as are mild. For whatever participates of life we may justly and with the greatest rectitude denominate an animal. But this which we are now speaking of participates the third species of soul, which we place between the præcordia and the navel: and in which there is neither any thing of opinion, reason, or intellect; but to which a pleasant and painful sense, together with desires, belongs. For it continually suffers all things. But when it is converted in itself, about itself, and, rejecting external, employs its own proper motion, it is not allotted by its generation a nature capable of considering its own concerns by any thing like a reasoning energy. On this account it lives, and is not different from an animal; but, becoming stably rooted, abides in a fixed position, through its being deprived of a motion originating from itself.

But when those superior artificers of our composition had implanted all these genera for the purpose of supplying nutriment to our nature, they deduced various channels in our body as in a garden, that it might be irrigated as it were by the accession of flowing moisture. And, in the first place, they cut two occult channels under the concretion of the skin and flesh, viz. two veins in the back, according to the double figure of the body on the right hand and the left. These they placed with the spine of the back, so as to receive the prolific marrow in the middle, that it might thus flourish in the most eminent degree; and, by copiously flowing from hence to other parts, might afford an equable irrigation. But after this, cutting the veins about the head, and weaving them with each other in an opposite direction, they separated them; inclining some from the right hand to the left hand parts of the body, and some from the left to the right, that the head, together with the skin, might be bound to the body, as it is not circularly divided with nerves about its summit; and besides this, that the passion of the senses might from each of these parts be deduced on all sides through the whole of the body. In this manner, then, they deduced an aqueduct from hence; the truth of which we shall easily perceive by assenting to the following position. That all such things as are composed from lesser parts are able to contain such as are greater; but such as consist from greater cannot invest those composed from lesser parts. But fire, among all the genera of things, is constituted from the smallest parts. Hence, it penetrates through water, earth, and air, and the composites from these; and this in such a manner, that nothing can restrain its pervading power. The same must be understood of that ventricle our belly; that it is able to retain the intromitted meat and drink, but cannot stay spirit and fire, because these consist of smaller parts than those from which the belly is composed. These, therefore, the Divinity employed for the purpose of producing an irrigation from the belly into the veins; weaving, from fire and air a certain flexible substance like a bow-net, and which possesses a two-fold gibbosity at the entrance. One of these he again wove together, divided into two parts; and circularly extended these parts from the curvatures like ropes through the whole body, as far as to the extremities of the not. All the interior parts therefore of the network he composed from fire; but the gibbosities and the receptacle itself from air. And lastly, receiving these, he disposed them in the animal new formed as follows:—In the first place, one of the gibbous parts he assigned to the mouth; but, as the gibbosity of this part is two-fold, he caused one part to pass through the arteries into the lungs, but the other along with the arteries into the belly. But having divided the other gibbous part according to each of its parts, he caused it to pass in common to the channels of the nose, so that, when the one part does not reach the mouth, all its streams may be filled from this. But he placed the other cavity of this gibbous substance about the hollow parts of the body; and caused the whole of this at one time to flow together gently into the gibbous parts, as they were of an aërial texture, and at another time to flow back again through the convex receptacles. But he so disposed the not, as being composed from a thin body, that it might inwardly penetrate and again emerge through this substance. Besides this, he ordered that the interior rays of fire should follow in continued succession, the air at the same time passing into each of the parts; and that this should never cease to take place as long as the mortal animal continued to subsist. But, in assigning an appellation to a motion of this kind, we denominate it expiration and respiration. But all this operation and the whole of this passion in our nature take place in the body by a certain irrigation and refrigeration conducive to our nutriment and life. For, when the breath passes inwardly and outwardly, an interior fire attends it in its course; and being diffused through the belly, when it meets with solid and liquid aliments, it reduces them to a state of fluidity; and, distributing them into the smallest parts, educes them as from a fountain through the avenues of its progression: pouring these small particles into the channels of the veins, and deducing rivers through the body as through a valley of veins.

But let us again consider the passion of respiration, and investigate through what causes it was generated, such as we perceive it at present. We should, consider it, therefore, as follows:—As there is no such thing as a vacuum into which any thing in motion can enter, and as breath passes from us externally, it is evident to every one that it cannot proceed into a void space, but must thrust that which is nearest to it from its proper seat; that again the repulsed nature must always expel its neighbour; and that from a necessity of this kind every thing which is impelled into that seat from which the emitted breath is excluded, must, when it has entered into and filled up this space, attend on the breath in its progression. And all this must take place like the revolution of a wheel, through the impossibility of a vacuum. Hence, when the breast and the lungs externally dismiss the breath, they are again replenished through the air which surrounds the body entering into and riding round the avenues of the flesh. But the air being again externally dismissed, and flowing round the body, impels the respiration inward, through the passages of the mouth and nostrils.

But we should establish the following as the cause from which the origin of these was derived. Every animal belonging to the universe possesses a heat in the veins and the blood, like a certain fountain of fire; and this heat we compared to a bow-net, extended through the middle of the body, and wholly woven from fire; all such things as are external being composed from air. But it must be confessed that heat naturally proceeds externally into a region to which it is allied. But as there are two progressions, one according to the body externally, but the other again according to the mouth and nostrils, hence, when the breath is impelled inward, it again thrusts back that by which it was impelled. And that which is drawn back, meeting with fire, becomes heated; while that which is exhaled becomes refrigerated. In consequence, therefore, of the heat being changed, and such things as subsist according to the other transition becoming more hot, and that again which is more fervid verging to its own nature,—hence, one thing strikes against and repels another in its course; and as they always suffer and mutually influence each other in the same manner, leaping this way and that in a circular progression, they give birth to the expiration and respiration of the breath. But in this manner also we should investigate the causes of those passions which arise from medical cupping-glasses, from drinking, from things violently hurled, whether upwards or on the ground; together with such sounds as appear swift and slow, sharp and flat, and which are at one time borne along unharmoniously, through the dissimilitude of the motion which they cause within us, and at another time attended with harmony, through the similitude of motion which they produce. For, the motions of such sounds as are prior and swifter ceasing, and proceeding to a nature similar to their own, are comprehended by such as are slower, which now succeed to the swifter, and set them again in motion. But during their comprehension of these they do not disturb them by introducing another motion, but lead on the beginning of the slower lation in conformity to that of the swifter. And these, adapting to themselves a similitude of the ceasing motion, mingle together one passion from the union of sharp and flat. From whence they afford pleasure to the unwise, but joy to the wise, through the imitation of divine harmony subsisting in mortal motions. And, indeed, with respect to all effluxions of water, the falling of thunder, and the wonderful circumstances observed in the attraction of amber, and of the Herculean stone;—in all these, nothing in reality of attraction takes place: but, as a vacuum cannot any where be found, and these particulars mutually impel each other,—hence, from the individuals when separated and mingled together tending to their proper seats, and from these passions being interwoven with each other, such admirable effects present themselves to the view of the accurate investigator. And indeed respiration (from whence our discourse originated) is generated from these causes, and after this manner, as we asserted above. For fire, dividing the aliment and becoming elevated internally, attending at the same time the breath in its ascent, fills the veins from the belly by this joint elevation; and this in consequence of drawing upwards from thence the dissected parts: so that by this means, through the whole body of every animal, the streams of nutriment are abundantly diffused. But the parts which are recently dissected and separated from their kindred natures, some of which are fruits and others grass, and which were produced by Divinity for the nourishment of our bodies, possess all-various colours through their mixture with each other: but for the most part a red colour predominates in them, whose nature is fabricated from a section of fire, and an abstersion in a moist substance. And hence, the colour of that which flows about the body is such as appears to the sight, and which we denominate blood; being the pasture of the flesh and of the whole body; from whence an irrigation becoming every where diffused, it copiously replenishes all the exhausted parts.

But the manner of impletion and evacuation is produced in the same way as in the universe the lation of every thing takes place, viz. from that cause through which every kindred nature tends to itself. For the natures by which we are externally invested perpetually liquefy and distribute our bodies, dismissing every species to its kindred form. But the sanguineous parts, being distributed and comprehended within us, as is the case with every animal constituted under the heavens, are compelled to imitate the local motion of the universe. Each, therefore, of the divided parts within us, being borne along to its kindred nature, replenishes again that which is void. But when the effluxions for pass the accessions, a corruption of the whole animal ensues; and when the contrary takes place, it receives an increase. The recent composition, therefore, of every animal possessing new triangles, like ships formed from timbers unimpaired by age, causes a strong enclosure of them within each other: but the whole of its delicate bulk unites in amicable conjunction, as being generated from most recent marrow, and nourished in milk. Those triangles, therefore, from which the liquid and solid aliments are composed, approaching externally, and being received into the animal, as they are more antient and imbecil than its own proper triangles, are vanquished and cut in pieces by the new triangles: and the animal is rendered of a large size, through its being nourished from a multitude of similar parts. But when it relaxes the root of its triangles, in consequence of becoming wearied and tamed, through many contests with many particulars in a long course of time; then it is no longer able to reduce by section the received aliment into a similitude of itself, but its own parts become easily dissipated by the natures which are externally introduced. Hence the whole animal, becoming by this means vanquished, decays; and the passion itself is denominated old-age. But the end of its existence then arrives, when the jointly harmonized bonds of the triangles about the marrow no longer possess a detaining power, but becoming separated through the weariness of labour, desert the bonds of the soul. The soul, however, in this case being concealed in a state according to nature, flies away with pleasure and delight, For every thing contrary to nature is painful; but that which happens naturally is pleasant. Hence, the death which is produced through wounds and disease is painful and violent; but that which is caused from old-age, proceeding to an end according to nature, is of all deaths the most free from labour, and is rather accompanied with pleasure than pain.

But it must be obvious to every one from whence diseases are produced. For, since there are four genera from which the body is composed, viz. earth, fire, water, and air, the unnatural abundance and defect, of these, and a translation from their own proper to a foreign seat, in consequence of which each of these does not receive that which is accommodated to its nature, together with all such circumstances as these, produce contentions and disease. For, each of these subsisting and being transferred in a manner contrary to nature, such things as were formerly heated become cold, such as were once dry become moist, such as were light heavy, and every thing receives all possible mutations. For we assert that when the same thing approaches to, and departs from, the same, in the same manner, and according to analogy, then alone it permits that which is the same to abide healthy and safe. But that which inordinately wanders, either in acceding or departing, produces all-various mutations, diseases, and infinite corruptions. Likewise a second apprehension of diseases may be obtained by any one who is so disposed, from the second compositions of things constituted according to nature. For, since the concretion of marrow, bone, flesh, and nerve, is derived from these, as likewise the blood, though from a different mode of coalition, hence many events happen in the same manner as those we have mentioned above; but the greatest and most severe diseases subsist as follows: When the generation of these second compositions takes place inversely, then they become subject to corruption. For the flesh and nerves are naturally generated from blood: the nerves indeed from fibres, through the alliance subsisting between these; but the flesh from the coalition of that which when separated from the fibres passes into a state of concretion. But that substance again which arises from nerves and flesh, being glutinous and fat, increases at the same time by nutrition the flesh, which for the most part subsists about the nature of the bones; and likewise the bone itself, with which the marrow is surrounded. And again, that which trickles through the density of the bones, being the most pure kind of the triangles, and the most smooth and unctuous, while it drops and distils from the bones, irrigates the marrow. And hence, when each particular subsists in this manner, a healthy condition of body is produced; but a diseased condition when the contrary is the case. For, when the flesh becoming liquefied again transmits the consumption into the veins, then the blood, together with spirit, becoming abundant and all-various in the veins, diversified with colours and density, and infected with acid and salt qualities, generates all-various bile, corruption, and phlegm. And all these, being again thus generated and corrupted, in the first place destroy the blood itself; and this, no longer affording nutriment to the body, is every where borne along through the veins, without observing a natural order in its circulations. But these indeed are unfriendly to each other, because they derive no mutual advantages from the properties with which each is endued. They likewise war upon the natural habit of the body, and its perseverance in its proper state, by introducing dissolutions and liquefactions.

A most antient portion of flesh, therefore, when it is liquefied and rendered difficult of digestion, grows black through antient burning; but through its being entirely macerated it becomes bitter, and adverse to all the other parts of the body which are not yet infected with corruption. And then indeed the black colour possesses sharpness instead of bitterness; that which was bitter becoming more attenuated: and the bitterness, being again tinged with blood, possesses a redder colour; but, from the black which is mingled with this, becomes of a bilious nature. But, besides this, a yellow colour is mingled with bitterness, when the new flesh liquefies through the fire subsisting about flame. And, indeed, either some physician will assign to all these the common appellation of bile, or some one who is able to consider things many and dissimilar, and to behold one genus in many particulars deserving one denomination. But such other things as are called species of bile receive an appellation peculiar to each, according to colour. But corruption (῾χωρ) which is the defluxion or whey of the blood, is gentle and mild: but that which is the sediment of black and sharp bile is of a ferocious and rustic nature, when it is mingled through heat with a saline power. And a substance of this kind is denominated acid phlegm. But a portion of recent and delicate flesh is often liquefied together with the air, and is after wards inflated and comprehended by moisture: and from this passion bubbles are produced, which taken separately are invisible on account of their smallness, but which, when collected into a large bulk, become conspicuous, and possess a white colour on account of the generation of froth. And we denominate all this liquefaction of delicate flesh, and which is woven together with spirit, white phlegm. But we call the sediment of recent phlegm tears and sweat; together with every thing of that kind into which the body is every day resolved. And all these, indeed, become the instruments of disease, when the blood does not naturally abound from liquid and solid aliment, but increases from contraries in such a manner as to violate the laws of nature. When, therefore, any part of the flesh is cut off, but at the same time the foundation of it remains, the calamity possesses but half its power; for it is capable of being easily recovered. But when that which binds the flesh to the bones becomes diseased, and the blood flowing from it and the nerves no longer nourishes the bones and binds the flesh, but, instead of being fat, smooth, and glutinous, becomes rough and salt through bad diet; then, in consequence of suffering all this, and being separated from the bones, it is refrigerated under the flesh and nerves. For the flesh, falling from its roots, leaves the nerves bare, and drenched in a salt humour; and hence, gliding again into the circulation of the blood, it increases the number of the diseases we have already described. And these passions, indeed, which subsist about the body, are of a grievous nature: but those which precede these are still more afflictive and troublesome. But this takes place when the bone through the density of the flesh does not admit sufficient respiration, but, being heated through filthiness, becomes rotten, receives no nutriment, but falls upon the flesh, which is on the contrary refrigerated; and the flesh again falls on the blood, so that by this means diseases more severe than the former are produced. But the extremity of all maladies then happens, when the nature of the marrow becomes diseased through some defect or excess: for then it produces the most vehement and fatal diseases; as the whole nature of the body is in this case necessarily dissipated and dissolved.

But it is requisite after this to understand that the third species of diseases receives a tripartite division. For one of the divisions is produced by spirit, the other by phlegm, and the other by bile. For when the lungs, those distributive guardians of the breath, being obstructed by defluxions, cannot afford a free passage to the breath; then, as there is no emission of the breath in one part, and more is received into another part than is requisite, the parts without refrigeration become rotten; but that which is received in too great abundance passing through the veins, distorts them and liquefies the diaphragm situated in the middle of the body: and thus ten thousand grievous diseases arise from hence, together with an abundance of sweat. But often, when the flesh becomes separated within the body, breath is produced; and this being incapable of departing externally, causes the same torments as the breath when entering from without. It produces, however, the greatest pains, when surrounding the nerves and neighbouring veins it inflates them, and stretches and distorts the ligaments and nerves continued from the back. And these diseases, from the stretching and inflating passion, are denominated tensions and contortions from behind; and of which it is difficult to find a cure. For, fevers taking place dissolve these diseases in a most eminent degree. But the white phlegm possessing a difficulty of respiring externally, through the spirit of the bubbles, variegates the body indeed in a milder nature, yet sprinkles it with white spots, and generates other diseases of a similar kind. But when this white phlegm is mingled with black bile, and becomes dissipated about the circulations of the head, which are of a most divine nature, then it disturbs these circulations; and if this happens in sleep, the perturbation is less violent; but if to those who are awake, it cannot without difficulty be expelled. And as this is a disease of a sacred nature, it is most justly denominated a sacred disease.

A sharp and salt phlegm is the fountain of all such diseases as are produced by a defluxion of humours: and because the places into which this phlegm flows possess an omniform variety, it generates all-various diseases. But whatever parts of the body are said to be inflated are thus affected from the inflammation of bile: which, when it expires, produces externally various tumours from its fervid nature; but, when inwardly restrained, generates many inflammatory diseases. It is, however, then greatest, when, being mingled with pure blood, it removes the fibres from their natural order, which are scattered into the blood for this purpose, that it may possess tenuity and density in a commensurate degree; and that it may neither through heat (as it is of a moist nature) flow from the thin body, nor, when becoming more dense, and of consequence more unadapted to motion, may scarcely be able to flow back again through the veins. The fibres, therefore, are very serviceable on this occasion, which if any one should collect together in the blood when dead, and in a state of frigidity, all the remaining blood would become diffused; and when poured forth they would be swiftly coagulated, together with the cold by which they are surrounded. But as the fibres possess this power in the blood, and the bile naturally becomes antient blood, and is again liquefied from flesh into this, such things as are hot and moist falling gradually the first of all, hence it becomes collected together through the power of the fibres. When the bile is coagulated and violently extinguished, it causes a tempest and tremour within. But when it flows more abundantly, vanquishing the fibres by its own proper heat, and becoming fervid in an inordinate degree, it then preserves the body: and if it retains its conquering power to the end, it penetrates into the marrow; and burning the bonds of the soul, as if they were the cables of a ship, dissolves her union, and dismisses her from thence entirely free. But when it flows with less abundance, and the body becoming liquefied opposes its passage, then finding itself vanquished, it either falls through the whole body, or, being compelled through the veins into the upper or lower belly, like one flying from a seditious city, it escapes from the body and introduces defluxions, dysenteries, or gripings of the intestines, and all diseases of a similar kind. When the body, therefore, is eminently diseased through excess of fire, it then labours under continued burnings and fever; but when through excess of air, under quotidian fevers under tertian through water, because water is more sluggish than fire and air; under quartan, through excess of earth. For earth, being the most sluggish of all these, is purified in quadruple periods of time; and on this account introduces quartan fevers, which it is scarcely possible to disperse. And in this manner are the diseases of the body produced.

But the diseases of the soul, which subsist through the habit of the body, are as follow:—We must admit that the disease of the soul is folly, or a privation of intellect. But there are two kinds of folly; the one madness, the other ignorance. Whatever passion, therefore, introduces either of these must be called a disease. And we should establish excessive pleasures and pains as the greatest diseases of the soul. For, when a man is too much elevated with joy or depressed with grief, while he hastens immoderately either to retain the one or to fly from the other, he is not able either to perceive or hear any thing properly, but is agitated with fury, and is very little capable of exercising the reasoning power. But he who possesses a great quantity of fluid seed about the marrow, and who, like a tree laden with a superabundance of fruit, riots in the excess,—such a one being influenced by many pains and pleasures in desires, and their attendant offspring, will be agitated with fury for the greatest part of his life through mighty pleasures and pains: and though the soul of such a one will be diseased and unwise, from the body with which it is connected, yet it will be falsely considered not as diseased, but as voluntarily bad. But in reality venereal intemperance for the most part becomes a disease of the soul, through a habit of one kind, from the tenuity of the bones, in a body fluid and moist. And, indeed, it may be nearly asserted, that all intemperance of pleasures of whatever kind, and all disgraceful conduct, is not properly blamed as the consequence of voluntary guilt. For no one is voluntarily bad: but he who is depraved becomes so through a certain ill habit of body, and an unskilful education. But these two circumstances are inimical to all, and productive of a certain ill. And again, the soul, when influenced by pain, suffers much depravity from this through the body. For, when sharp and salt phlegm, and likewise bitter and bilious humours, wandering through the body, are prevented from passing forth externally, but, revolving inwardly, mingle their exhalations with the circulation of the soul; in this case they produce all-various diseases of the soul, in a greater and less degree, and less and more numerous. They are introduced, indeed, to three seats of the soul; and according to the diversity of the place, each generates all-various species of difficulty and sorrow, of boldness and timidity, and, still further, of oblivion and indocility. But, besides this, the vicious manners of cities, and discourses both private and public, often contribute to increase this malady: nor are any disciplines taught in the early part of life, which might serve as remedies for such mighty ills. And thus all such as are vicious are so through two involuntary causes; the existence of which we should always rather ascribe to the planters than to the things planted, and to the educators rather than to the educated. We should, therefore, endeavor to the utmost of our ability, by education, studies, and disciplines, to fly from vice, and acquire its contrary, virtue. But these particulars, indeed, belong to another mode of discourse.

Again, therefore, with respect to the contrary of these, it is now proper to explain in a becoming manner by what culture, and from what causes, we may preserve both the body and dianoëtic energies of the soul. For it is more just to discourse concerning good things than of such as are evil. But every thing good is beautiful; and that which is beautiful is not destitute of measure. An animal, therefore, which is about to be beautiful and good, must possess commensuration. But, perceiving certain small particulars of things commensurate, we syllogize concerning them; while at the same time we are ignorant of such as are greatest and the chief. For, indeed, no symmetry and immoderation is of greater consequence with respect to health and disease, virtue and vice, than that of the soul towards the body. But we consider no circumstance of these; nor do we perceive that when a more imbecil and inferior form is the vehicle of a robust and every way mighty soul, and when, on the contrary, these two pass into a state of concretion, then the whole animal cannot subsist in a beautiful manner: For it is incommensurate through the want of the greatest symmetry. But the animal whose composition is contrary to this, affords a spectacle to him who is able to behold it, of all spectacles the most beautiful and lovely. When the body, therefore, possesses legs immoderately large, or any other member surpassing its just proportion, and becomes through this incommensurate with itself, it is rendered at the same time base, in the endurance of labour suffers many molestations and many convulsions, and through an aggregation of accidents becomes the cause of innumerable maladies to itself. The same too must be understood concerning that composition of body and soul which we denominate an animal. As, for instance, that when the soul in this composite is more robust than the body, and possesses it raging and transported, then the soul, agitating the whole of it, inwardly fills it with diseases; and, when she vehemently applies herself to certain disciplines, causes it to liquefy and waste away. Lastly, when the soul employs herself in teaching and literary contests, both in public and private, through a certain ambitious strife, then inflaming the body, she dissolves its constitution; and besides this, introducing distillations of humours, she deceives the most part of those who are called physicians, and induces them to consider these effects as proceeding from contrary causes.

But again, when a mighty body and above measure frigid is conjoined with a small and imbecil dianoëtic part, since there are naturally two-fold desires in man, one of aliment through the body, but the other of prudence through the most divine part of our nature;—in this case, the motions of that which is more powerful prevail, and increase that which is their own: but render the dianoëtic part of the soul dull, indocile, and oblivious, and thus produce ignorance, which is the greatest of all diseases. But this one thing alone is the health and safety of both—neither to move the soul without the body, nor the body without the soul; that, being equally balanced in their mutual contentions, the health of the whole composite may be preserved. Hence, he who vehemently applies himself to the mathematics, or to any other dianoëtic exercise, should also employ the motion of the body, and be familiar with gymnastic. And again, he who is careful in forming his body aright should at the same time unite with this the motions of the soul, employing music and all philosophy; if he is to be rendered such a one as can be justly called beautiful, and at the same time truly good. In the same manner, too, we ought to take care of the parts of the body, imitating the form of the whole. For when the body, through such things as are introduced from without, is inflamed and refrigerated, and is again rendered dry and moist by externals, and suffers every thing consequent to these affections; then, if any one in a quiet state gives up his body to motions, he will be vanquished by them and dissolved. But if anyone imitates that nature which we called the nourisher of the universe, so as never to suffer the body to be in a state of rest, but perpetually moves and agitates it throughout, he will then assist the internal and external motions according to nature; and, in consequence of a moderate agitation, will reduce into order and adorn the wandering passions and parts of the body, according to their alliance with each other. Such a one, indeed, as we said in our former discourse about the universe, will not, by placing foe against foe, suffer war and disease to be produced in the body; but, combining friend with friend, will thus render the body healthy and sound. But, of all motions, that is the best in any nature which takes place in itself from itself: for this is particularly allied to the dianoëtic motion of the universe. But that motion is of the worse kind which is produced by another. And that is the worst of all motions, when the body, being in a recumbent and quiet state, is moved by others according to parts. And hence, of all the purgations and concretions of the body, that is the best which subsists through gymnastic. The next to this is that which takes place through easy carriage, whether in a ship or any other convenient vehicle. But the third species of motion is only to be used when vehemently necessary, and at no other time by any one endued with intellect: and this is that medical motion which is performed by pharmaceutical purgations. For diseases, unless they are extremely dangerous, are not to be irritated by medicines. For every composition of diseases is in a certain respect similar to the nature of animals. And indeed the association of the animal nature is allotted stated periods of life; both the whole genus, and every individual, containing in itself a fatal term of living, separate from the passions which necessity produces. For the triangles, which from the very beginning possessed the power of each animal, are sufficiently able to cohere together for a certain time: but life beyond this period cannot be extended to any one. The same mode of composition likewise subsists about diseases; which if any one destroys by medicine before the fated time, he will only produce great diseases from small ones, and many from a few. On this account it is necessary to discipline all such maladies by proper diet, according as every one's leisure will permit; and to avoid irritating by medicines a most difficult disease. And thus much may suffice concerning the common animal and its corporeal part; and how these may be disciplined and governed in such a manner as to produce a life according to reason in the most eminent degree.

But that which is destined to govern, ought much more and by far the first to be furnished as much as possible with such materials as may render it capable, of disciplinative sway, in a manner the most beautiful and the best. To discuss accurately indeed particulars of this kind would require a treatise solely confined to such a discussion: but if any one slightly considers this affair in a manner consequent to what has been above delivered, such a one by thus proceeding will not unseasonably arrive at the end of his pursuit. We have often then previously asserted that there are three species of soul within us, triply distributed; and that each has its own proper motions. And we shall now, therefore, briefly affirm, that when any one of them is in a torpid state, and rests from its own proper motions, it necessarily becomes most imbecil; but that, when it is employed in convenient exercises, it becomes most vigorous and robust. We should, therefore, be careful that the several species may preserve their motions, so as to be commensurate to each other.

But with respect, however, to the most principal and excellent species of the soul, we should conceive as follows: that Divinity assigned this to each of us as a daemon; and that it resides in the very summit of the body, elevating us from earth to an alliance with the heavens; as we are not terrestrial plants, but blossoms of heaven. And this indeed is most truly asserted. For, from whence the first generation of the soul arose, from thence a divine nature being suspended from our head and root, directs and governs the whole of our corporeal frame. In him, therefore, who vehemently labours to satisfy the cravings of desire and ambition, all the conceptions of his soul must be necessarily mortal; and himself as much as possible must become entirely mortal, since he leaves nothing unaccomplished which tends to increase his perishable part. But it is necessary that he who is sedulously employed in the acquisition of knowledge, who is anxious to acquire the wisdom of truth, and who employs his most vigorous exertions in this one pursuit;—it is perfectly necessary that such a one, if he touches on the truth, should be endued with wisdom about immortal and divine concerns; and that he should participate of immortality, as far as human nature permits, without leaving any part of it behind. And besides, as such a one always cultivates that which is divine, and has a daemon most excellently adorned residing in his essence, he must be happy in the most eminent degree. But the culture of all the parts is indeed entirely one, and consists in assigning proper nutriment and motion to each. But the motions which are allied to the divine part of our nature are the dianoëtic energies and circulations of the universe. These, therefore, each of us ought to pursue; restoring in such a manner those revolutions in our head (which have been corrupted by our wanderings about generation), through diligently considering the harmonies and circulations of the universe, that the intellective power may become assimilated to the object of intelligence, according to its ancient nature. For, when thus assimilated, we shall obtain the end of the best life proposed by the Gods to men, both at present and in all the future circulations of time. And now that disputation which we announced at the beginning concerning the universe, as far as to the generation of man, has almost received its consummation. For we shall briefly run over the generation of other animals, and this no further than necessity requires: for thus any one may appear to himself to preserve a convenient measure in such a disputation. Let us, therefore, speak concerning these as follows:

Those who on becoming men are timid, and pass through life unjustly, will according to assimilative reasoning be changed into women in their second generation. And at the same time through this cause the Gods devised the love of copulation; composing an animal or animated substance, and placing one in us, but another in the female nature. But they produced each in the following manner. That procession of liquid aliment which passes through the lungs under the reins into the bladder, and which being compressed by the breath is emitted externally,—this the Gods receiving, they deduced it after the manner of a pipe into the concrete marrow, through the neck and spine of the back: and this is what we called seed in the former part of our discourse. But this, in consequence of being animated and receiving respiration, produces in the part where it respires a vital desire of effluxion; and thus perfects in us the love of begetting. On this account, that nature which subsists about the privy parts of men, becoming refractory and imperious, and as it were an animal unobedient to reason, endeavors through raging desire to possess absolute sway. In like manner the privities and matrix of women, forming an animal desirous of procreating children, when it remains without fruit beyond the flower of its age, or for a still more extended period, suffers the restraint with difficulty and indignation; and wandering every way through the body, obstructs the passage of the breath, does not permit respiration to take place, introduces other extreme difficulties, and causes all-various diseases; till the desire and love of the parts educe seed like fruit from a tree: but, when educed, they scatter it into the matrix as into a field. Hence women conceive animals invisible at first through their smallness, rude and unformed; when they become large, through dispersion of the seed, nourish them within; and, lastly, leading them into light perfect the generation of animals. In this manner, therefore, is the generation of women and every thing female performed. But the tribe of birds in the next place, fashioned from men, and receiving wings instead of hairs. These are produced from such men as are indeed innocent, but inconstant and light; who are curious about things situated on high; but are so infatuated as to think, from the testimony of the sight, that demonstrations about things of this kind are the most firm and incontrovertible of all. But the pedestrian and savage tribe of animals was generated from men, who being entirely destitute of philosophy, never elevated their eyes to any object in the heavens; and this because they never employed the circulations in the head, but followed the impulse of those parts of the soul which rule in the belly and breast. Hence from studies of this kind drawing the anterior members and head to the ground, they fix them through proximity of nature in the earth. Besides this, they possess long and all-various heads; as the circulations of each are through idleness compressed and broken: and by this means their race becomes quadruped and multiped; the Divinity assigning many feet to such as are more unwise, that they may be more strongly drawn towards the earth. But the most unwise of these, and every way extending all their body on the earth, as if there was no longer any occasion of feet, the Gods generated without feet, and destined them to creep on the earth. The fourth genus is the aquatic, which was produced from such men as were stupid and ignorant in the most remarkable degree; and whom those transformers of our nature did not think deserving of a pure respiration, on account of their possessing a soul in an unpurified state, through extreme transgression. And hence they impelled them into the turbid and profound respiration of water, instead of the attenuated and pure respiration of air: from whence the genus of fish and oysters, and the multitude of all aquatic animals arose; and who are allotted habitations in the last regions of the universe, as the punishment of extreme ignorance. And thus after this manner, both formerly and now, animals migrate into each other; while they are changed by the loss and acquisition of intellect and folly. Our discourse, therefore, concerning the universe has now obtained its conclusion. For this world, comprehending and receiving its completion from mortal and immortal animals, is thus rendered a visible animal containing visible natures, the image of an intelligible God, sensible, the greatest and best, the most beautiful and perfect; being no other than this one and only-begotten heaven.

# Timaeus

Translated by Donald J. Zeyl.

Socrates, Critias, Timaeus, Hermocrates

Socrates:: One, two, three… Where's number four, Timaeus? The four of you were my guests yesterday and today I'm to be yours.

Timaeus:: He came down with something or other, Socrates. He wouldn't have missed our meeting willingly.

Socrates:: Well then, isn't it for you and your companions to fill in for your absent friend?

Timaeus:: You're quite right. Anyhow, we'll do our best not to come up short. You did such a fine job yesterday hosting us visitors that now it wouldn't be right if the three of us didn't go all out to give you a feast in return.

Socrates:: Do you remember all the subjects I assigned to you to speak on?

Timaeus:: Some we do. And if there are any we don't—well, you're here to remind us. Better still, if it's not too much trouble, why don't you take a few minutes to go back through them from the beginning? That way they'll be the more firmly fixed in our minds.

Socrates:: Very well. I talked about politics yesterday and my main point, I think, had to do with the kind of political structure cities should have and the kind of men that should make it up so as to be the best possible.

Timaeus:: Yes, Socrates, so you did, and we were all very satisfied with your description of it.

Socrates:: Didn't we begin by separating off the class of farmers and all the other craftsmen in the city from the class of those who were to wage war on its behalf?

Timaeus:: Yes.

Socrates:: And we followed nature in giving each person only one occupation, one craft for which he was well suited. And so we said that only those whose job it was to wage war on everyone's behalf should be the guardians of the city. And if some foreigner or even a citizen were to go against the city to cause trouble, these guardians should judge their own subjects lightly, since they are their natural friends. But they should be harsh, we said, with the enemies they encountered on the battlefield.

Timaeus:: Yes, absolutely.

Socrates:: That's because—as I think we said—the guardians' souls should have a nature that is at once both spirited and philosophical to the highest degree, to enable them to be appropriately gentle or harsh as the case may be.

Timaeus:: Yes.

Socrates:: What about their training? Didn't we say that they were to be given both physical and cultural training, as well as training in any other appropriate fields of learning?

Timaeus:: We certainly did.

Socrates:: Yes, and we said, I think, that those who received this training shouldn't consider gold or silver or anything else as their own private property. Like the professionals they are, they should receive from those under their protection a wage for their guardianship that's in keeping with their moderate way of life. And we said that they should share their expenses and spend their time together, live in one another's company, and devote their care above all to excellence, now that they were relieved of all other occupations.

Timaeus:: Yes, we said that as well.

Socrates:: And in fact we even made mention of women. We said that their natures should be made to correspond with those of men, and that all occupations, whether having to do with war or with the other aspects of life, should be common to both men and women.

Timaeus:: That, too, was discussed.

Socrates:: And what did we say about the procreation of children? We couldn’t possibly forget that subject, because what we said about it was so unusual. We decided that they should all have spouses and children in common and that schemes should be devised to prevent anyone of them from recognizing his or her own particular child. Everyone of them would believe that they all make up a single family, and that all who fall within their own age bracket are their sisters and brothers, that those who are older, who fall in an earlier bracket, are their parents or grandparents, while those who fall in a later one are their children or grandchildren.

Timaeus:: You’re right. That really was an unforgettable point.

Socrates:: And surely we also remember saying, don’t we, that to make their natures as excellent as possible right from the start, the rulers, male and female, should secretly arrange marriages by lot, to make sure that good men and bad ones would each as a group be separately matched up with women like themselves? And we said that this arrangement wouldn’t create any animosity among them, because they’ believe that the matching was due to chance?

Timaeus:: Yes, we remember.

Socrates:: And do we also remember saying that the children of the good parents were to be brought up, while those of the bad ones were to be secretly handed on to another city? And that these children should be constantly watched as they grew up, so that the ones that turned out deserving might be taken back again and the ones they kept who did not turn out that way should change places with them?

Timaeus:: We did say so.

Socrates:: So now, Timaeus, are we done with our review of yesterday's talk—at least with its main points—or are we missing some point we made then? Have we left anything out?

Timaeus:: Not a thing, Socrates. This is exactly what we said.

Socrates:: All right, I'd like to go on now and tell you what I've come to feel about the political structure we've described. My feelings are like those of a man who gazes upon magnificent looking animals, whether they're animals in a painting or even actually alive but standing still, and who then finds himself longing to look at them in motion or engaged in some struggle or conflict that seems to show off their distinctive physical qualities. I felt the same thing about the city we've described. I'd love to listen to someone give a speech depicting our city in a contest with other cities, competing for those prizes that cities typically compete for. I'd love to see our city distinguish itself in the way it goes to war and in the way it pursues the war: that it deals with the other cities, one after another, in ways that reflect positively on its own education and training, both in word and deed—that is, both in how it behaves toward them and how it negotiates with them. Now on these matters, Critias and Hermocrates, I charge myself with being quite unable to sing fitting praise to our city and its men. That this should be so in my case isn't at all surprising. But I have come to have the same opinion of the poets, our ancient poets as well as today's. I have no disrespect for poets in general, but everyone knows that imitators as a breed are best and most adept at imitating the sort of things they've been trained to imitate. It’s difficult enough for any one of them to do a decent job of imitating in performance, let alone in narrative description, anything that lies outside their training. And again, I’ve always thought that sophists as a class are very well versed in making long speeches and doing many other fine things. But because they wander from one city to the next and never settle down in homes of their own, I’m afraid their representations of those philosopher-statesmen would simply miss their mark. Sophists are bound to misrepresent whatever these leaders accomplish on the battlefield when they engage any of their enemies, whether in actual warfare or in negotiations.

So that leaves people of your sort, then. By nature as well as by training you take part in both philosophy and politics at once. Take Timaeus here. He’s from Locri, an Italian city under the rule of excellent laws. None of his compatriots outrank him in property or birth, and he has come to occupy positions of supreme authority and honor in his city. Moreover, he has, in my judgment, mastered the entire field of philosophy. As for Critias, I’m sure that all of us here in Athens know that he’s no mere layman in any of the areas we’re talking about. And many people whose testimony must surely be believed assure us that Hermocrates, too, is well qualified by nature and training to deal with these matters. Already yesterday I was aware of this when you asked me to discuss matters of government, and that’s why I was eager to do your bidding. I knew that if you'd agree to make the follow-up speech, no one could do a better job than you. No one today besides you could present our city pursuing a war that reflects her true character. Only you could give her all she requires. So now that I’m done speaking on my assigned subject, I’ve turned the tables and assigned you to speak on the subject I’ve just described. You’ve thought about this together as a group, and you’ve agreed to reciprocate at this time. Your speeches are your hospitality gifts, and so here I am, all dressed up for the occasion. No one could be more prepared to receive your gifts than I.

Hermocrates:: Yes indeed, Socrates, you won't find us short on enthusiasm, as Timaeus has already told you. We don't have the slightest excuse for not doing as you say. Why, already yesterday, right after we had left here and got to Critias' guest quarters where we're staying—and even earlier on our way there—we were thinking about this very thing. And then Critias brought up a story that goes back a long way. Tell him the story now, Critias, so he can help us decide whether or not it will serve the purpose of our assignment.

Critias:: Yes, we really should, if our third partner, Timaeus, also agrees.

Timaeus:: Of course I do.

Critias:: Let me tell you this story then, Socrates. It's a very strange one, but even so, every word of it is true. It's a story that Solon, the wisest of the seven sages once vouched for. He was a kinsman and a very close friend of my great-grandfather Dropides. Solon himself says as much in many places in his poetry. Well, Dropides told the story to my grandfather Critias, and the old man in his turn would tell it to us from memory. The story is that our city had performed great and marvelous deeds in ancient times, which, owing to the passage of time and to the destruction of human life, have vanished. Of all these deeds one in particular was magnificent. It is this one that we should now do well to commemorate and present to you as our gift of thanks. In so doing we shall also offer the goddess a hymn, as it were, of just and true praise on this her festival.

Socrates:: Splendid! Tell me, though, what was that ancient deed our city performed, the one that Solon reported and old Critias told you about? I’ve never heard of it. They say it really happened?

Critias:: I’ll tell you. It’s an ancient story I heard from a man who was no youngster himself. In fact, at the time Critias was pretty close to ninety years old already—so he said—and I was around ten or so. As it happened, it was the day of the presentation of children during the Apaturia. On this occasion, too, we children got the customary treatment at the feast: our fathers started a recitation contest. Many compositions by many different poets were recited, and many of us children got to sing the verses of Solon, because they were new at the time. Now someone, a member of our clan, said that he thought that Solon was not only the wisest of men in general, but that his poetry in particular showed him to be the most civilized of all the poets. (The man may have been speaking his mind, or else he may have just wanted to make Critias feel good.) And the old man—how well I remember it—was tickled. He grinned broadly and said, “Yes, Amynander, it’s too bad that Solon wrote poetry only as a diversion and didn’t seriously work at it like the other poets. And too bad that he never finished the story he'd brought back home with him from Egypt. He was forced to abandon that story on account of the civil conflicts and all the other troubles he found here when he returned. Otherwise not even Hesiod or Homer, or any other poet at all would ever have become more famous than he. That’s what I think, anyhow.” “Well, Critias? What story was that?” asked the other. “It’s the story about the most magnificent thing our city has ever done,” replied Critias, “an accomplishment that deserves to be known far better than any of her other achievements. But owing to the march of time and the fact that the men who accomplished it have perished, the story has not survived to the present.” “Please tell us from the beginning," said the other, "What was this 'true story' that Solon heard? How did he get to hear it? Who told him?"

"In Egypt," Critias began, "in that part of the Delta where the stream of the Nile divides around the vertex there is a district called the Saitic. The most important city of this district is Sais. (This is in fact also the city from which King Amasis came.) This city was founded by a goddess whose name was 'Neith' in Egyptian and (according to the people there) 'Athena' in Greek. They are very friendly to Athens and claim to be related to our people somehow or other. Now Solon said that when he arrived there the people began to revere him. Furthermore, he said that when he asked those priests of theirs who were scholars of antiquity about ancient times, he discovered that just about every Greek, including himself, was all but completely ignorant about such matters. On one occasion, wanting to lead them on to talk about antiquity, he broached the subject of our own ancient history. He started talking about Phoroneus—the first human being, it is said—and about Niobe, and then he told the story of how Deucalion and Pyrrha survived the flood. He went on to trace the lines of descent of their posterity, and tried to compute their dates by calculating the number of years which had elapsed since the events of which he spoke. And then one of the priests, a very old man, said, 'Ah, Solon, Solon, you Greeks are ever children. There isn't an old man among you.' On hearing this, Solon said, 'What? What do you mean?' 'You are young,' the old priest replied, 'young in soul, every one of you. Your souls are devoid of beliefs about antiquity handed down by ancient tradition. Your souls lack any learning made hoary by time. The reason for that is this: There have been, and there will continue to be, numerous disasters that have destroyed human life in many kinds of ways. The most serious of these involve fire and water, while the lesser ones have numerous other causes. And so also among your people the tale is told that Phaethon, child of the Sun, once harnessed his father's chariot, but was unable to drive it along his father's course. He ended up burning everything on the earth's surface and was destroyed himself when a lightning bolt struck him. This tale is told as a myth, but the truth behind it is that there is a deviation in the heavenly bodies that travel around the earth, which causes huge fires that destroy what is on the earth across vast stretches of time. When this happens all those people who live in mountains or in places that are high and dry are much more likely to perish than the ones who live next to rivers or by the sea. Our Nile, always our savior, is released and at such times, too, saves us from this disaster. On the other hand, whenever the gods send floods of water upon the earth to purge it, the herdsmen and shepherds in the mountains preserve their lives, while those who live in cities, in your region, are swept by the rivers into the sea. But here, in this place, water does not flow from on high onto our fields, either at such a time or any other. On the contrary, its nature is always to rise up from below. This, then, explains the fact that the antiquities preserved here are said to be the most ancient. The truth is that in all places where neither inordinate cold nor heat prevent it, the human race will continue to exist, sometimes in greater, sometimes in lesser numbers. Now of all the events reported to us, no matter where they've occurred—in your parts or in ours—if there are any that are noble or great or distinguished in some other way, they've all been inscribed here in our temples and preserved from antiquity on. In your case, on the other hand, as in that of others, no sooner have you achieved literacy and all the other resources that cities require, than there again, after the usual number of years, comes the heavenly flood. It sweeps upon you like a plague, and leaves only your illiterate and uncultured people behind. You become infants all over again, as it were, completely unfamiliar with anything there was in ancient times, whether here or in your own region. And so, Solon, the account you just gave of your people's lineage is just like a nursery tale. First of all, you people remember only one flood, though in fact there had been a great many before. Second, you are unaware of the fact that the finest and best of all the races of humankind once lived in your region. This is the race from whom you yourself, your whole city, all that you and your countrymen have today, are sprung, thanks to the survival of a small portion of their stock. But this has escaped you, because for many generations the survivors passed on without leaving a written record. Indeed, Solon, there was a time, before the greatest of these devastating floods, when the city that is Athens today not only excelled in war but also distinguished itself by the excellence of its laws in every area. Its accomplishments and its social arrangements are said to have been the finest of all those under heaven of which we have received report.'

"When Solon heard this he was astounded, he said, and with unreserved eagerness begged the priests to give him a detailed, consecutive account of all that concerned those ancient citizens. 'I won't grudge you this, Solon.' the priest replied. I'll tell you the story for your own benefit as well as your city's, and especially in honor of our patron goddess who has founded, nurtured and educated our cities, both yours and ours. Yours she founded first, a thousand years before ours, when she had received from Earth and Hephaestus the seed from which your people were to come. Now our social arrangement, according to the records inscribed in our sacred documents, is eight thousand years old. Nine thousand years ago, then, did these fellow citizens of yours live, whose laws and whose finest achievement I'll briefly describe to you. At another time we'll go through all the details one by one at our leisure and inspect the documents themselves.

"'Let's compare your ancient laws with ours today. You'll discover many instances that once existed among you, existing among us today. First, you'll find that the class of priests is marked off and separated from the other classes. Next, in the case of the working class, you'll find that each group—the herdsmen, the hunters and the farmers—works independently, without mixing with the others. In particular, I'm sure you've noticed that our warrior class has been separated from all the others. It's been assigned by law to occupy itself exclusively with matters of war. Moreover, the style of armor used is that of shields and spears, which we were the first among the peoples of Asia to use for arming ourselves. The goddess instructed us just as she first instructed you in the regions where you live. Moreover, as for wisdom, I'm sure you can see how much attention our way of life here has devoted to it, right from the beginning. In our study of the world order we have traced all our discoveries, including prophecy and health-restoring medicine, from those divine realities to human levels, and we have also acquired all the other related disciplines. This is in fact nothing less than the very same system of social order that the goddess first devised for you when she founded your city, which she did once she had chosen the region in which your people were born, and had discerned that the temperate climate in it throughout the seasons would bring forth men of surpassing wisdom. And, being a lover of both war and wisdom, the goddess chose the region that was likely to bring forth men most like herself, and founded it first. And so you came to live there, and to observe laws such as these. In fact your laws improved even more, so that you came to surpass all other peoples in every excellence, as could be expected from those whose begetting and nurture were divine.

"'Now many great accomplishments of your city recorded here are awe-inspiring, but there is one that surely surpasses them all in magnitude and excellence. The records speak of a vast power that your city once brought to a halt in its insolent march against the whole of Europe and Asia at once—a power that sprang forth from beyond, from the Atlantic ocean. For at that time this ocean was passable, since it had an island in it in front of the strait that you people say you call the 'Pillars of Heracles.' This island was larger than Libya and Asia combined, and it provided passage to the other islands for people who traveled in those days. From those islands one could then travel to the entire continent on the other side, which surrounds that real sea beyond. Everything here inside the strait we're talking about seems nothing but a harbor with a narrow entrance, whereas that really is an ocean out there and the land that embraces it all the way around truly deserves to be called a continent. Now on this Isle of Atlantis a great and marvelous royal power established itself, and ruled not only the whole island, but many of the other islands and parts of the continent as well. What's more, their rule extended even inside the strait, over Libya as far as Egypt, and over Europe as far as Tyrrhenia. Now one day this power gathered all of itself together, and set out to enslave all of the territory inside the strait, including your region and ours, in one fell swoop. Then it was, Solon, that your city's might shone bright with excellence and strength, for all humankind to see. Preeminent among all others in the nobility of her spirit and in her use of all the arts of war, she first rose to the leadership of the Greek cause. Later, forced to stand alone, deserted by her allies, she reached a point of extreme peril. Nevertheless she overcame the invaders and erected her monument of victory. She prevented the enslavement of those not yet enslaved, and generously freed all the rest of us who lived within the boundaries of Heracles. Some time later excessively violent earthquakes and floods occurred, and after the onset of an unbearable day and a night, your entire warrior force sank below the earth all at once, and the Isle of Atlantis likewise sank below the sea and disappeared. That is how the ocean in that region has come to be even now unnavigable and unexplorable, obstructed as it is by a layer of mud at a shallow depth, the residue of the island as it settled.'"

What I've just related, Socrates, is a concise version of old Critias' story, as Solon originally reported it. While you were speaking yesterday about politics and the men you were describing, I was reminded of what I've just told you and was quite amazed as I realized how by some supernatural chance your ideas are on the mark, in substantial agreement with what Solon said. I didn't want to say so at the time, though. Because it had been so long ago, I didn't remember Solon's story very well. So I realized that I would first have to recover the whole story for myself well enough, and then to tell it that way. That's why I was so quick to agree to your assignment yesterday. The most important task in situations like these is to propose a speech that rewards people's expectations, and so I thought that we would be well supplied if I gave this one. And that's how—as Hermocrates has already said—the moment I left here yesterday, I began to repeat the story to him and to Timaeus as it came back to me. After I left them I concentrated on it during the night and recovered just about the whole thing. They say that the lessons of childhood have a marvelous way of being retained. How true that is! In my case, I don't know if I'd be able to recall everything I heard yesterday, but I'd be extremely surprised if any part of this story has gotten away from me, even though it's been a very long time since I heard it. What I heard then gave me so much childlike pleasure—the old man was so eager to teach me because I kept on asking one question after another—that the story has stayed with me like the indelible markings of a picture with the colors burnt in. Besides, I told the whole story to Timaeus and Hermocrates first thing this morning, so that not just I, but they, too, would have a supply of material for our speech.

I've said all this, Socrates, to prepare myself to tell Solon's story now. I won't just give you the main points, but the details, one by one, just the way I heard it. We'll translate the citizens and the city you described to us in mythical fashion yesterday to the realm of fact, and place it before us as though it is ancient Athens itself. And we'll say that the citizens you imagined are the very ones the priest spoke about, our actual ancestors. The congruence will be complete, and our song will be in tune if we say that your imaginary citizens are the ones who really existed at that time. We'll share the task among us, and we'll all try our best to do justice to your assignment. What do you think, Socrates? Will this do as our speech, or should we look for another to replace it?

Socrates:: Well, Critias, what other speech could we possibly prefer to this one? We're in the midst of celebrating the festival of the goddess, and this speech really fits the occasion. So it couldn't be more appropriate. And of course the fact that it's no made-up story but a true account is no small matter. How and where shall we find others to celebrate if we let these men go? We've no choice. Go on with your speech, then, and good luck! It's my turn now to sit back and listen to your speeches that pay back mine of yesterday.

Critias:: All right, Socrates, what do you think of the plan we've arranged for our guest gift to you? We thought that because Timaeus is our expert in astronomy and has made it his main business to know the nature of the universe, he should speak first, beginning with the origin of the universe, and concluding with the nature of human beings. Then I'll go next, once I'm in possession of Timaeus' account of the origin of human beings and your account of how some of them came to have a superior education. I'll introduce them, as not only Solon's account but also his law would have it, into our courtroom and make them citizens of our ancient city—as really being those Athenians of old whom the report of the sacred records has rescued from obscurity—and from then on I'll speak of them as actual Athenian citizens.

Socrates:: Apparently I'll be getting a complete, brilliant banquet of speeches in payment for my own. Very well then, Timaeus, the task of being our next speaker seems to fall to you. Why don't you make an invocation to the gods, as we customarily do?

Timaeus:: That I will, Socrates. Surely anyone with any sense at all will always call upon a god before setting out on any venture, whatever its importance. In our case, we are about to make speeches about the universe—whether it has an origin or even if it does not—and so if we're not to go completely astray we have no choice but to call upon the gods and goddesses, and pray that they above all will approve of all we have to say, and that in consequence we will, too. Let this, then, be our appeal to the gods; to ourselves we must appeal to make sure that you learn as easily as possible, and that I instruct you in the subject matter before us in the way that best conveys my intent.

As I see it, then, we must begin by making the following distinction: What is that which always is and has no becoming, and what is that which becomes but never is? The former is grasped by understanding, which involves a reasoned account. It is unchanging. The latter is grasped by opinion, which involves unreasoning sense perception. It comes to be and passes away, but never really is. Now everything that comes to be must of necessity come to be by the agency of some cause, for it is impossible for anything to come to be without a cause. So whenever the craftsman looks at what is always changeless and, using a thing of that kind as his model, reproduces its form and character, then, of necessity, all that he so completes is beautiful. But were he to look at a thing that has come to be and use as his model something that has been begotten, his work will lack beauty.

Now as to the whole universe or world order [kosmos]—lets just call it by whatever name is most acceptable in a given context—there is a question we need to consider first. This is the sort of question one should begin with in inquiring into any subject. Has it always existed? Was there no origin from which it came to be? Or did it come to be and take its start from some origin? It has come to be. For it is both visible and tangible and it has a body—and all things of that kind are perceptible. And, as we have shown, perceptible things are grasped by opinion, which involves sense perception. As such, they are things that come to be, things that are begotten. Further, we maintain that, necessarily, that which comes to be must come to be by the agency of some cause. Now to find the maker and father of this universe [to pan] is hard enough, and even if I succeeded, to declare him to everyone is impossible. And so we must go back and raise this question about the universe: Which of the two models did the maker use when he fashioned it? Was it the one that does not change and stays the same, or the one that has come to be? Well, if this world of ours is beautiful and its craftsman good, then clearly he looked at the eternal model. But if what it's blasphemous to even say is the case, then he looked at one that has come to be. Now surely it’s clear to all that it was the eternal model he looked at, for, of all the things that have come to be, our universe is the most beautiful, and of causes the craftsman is the most excellent. This, then, is how it has come to be: it is a work of craft, modeled after that which is changeless and is grasped by a rational account, that is, by wisdom.

Since these things are so, it follows by unquestionable necessity that this world is an image of something. Now in every subject it is of utmost importance to begin at the natural beginning, and so, on the subject of an image and its model, we must make the following specification: the accounts we give of things have the same character as the subjects they set forth. So accounts of what is stable and fixed and transparent to understanding are themselves stable and unshifting. We must do our very best to make these accounts as irrefutable and invincible as any account may be. On the other hand, accounts we give of that which has been formed to be like that reality, since they are accounts of what is a likeness, are themselves likely, and stand in proportion to the previous accounts, i.e., what being is to becoming, truth is to convincingness. Don’t be surprised then, Socrates, if it turns out repeatedly that we won’t be able to produce accounts on a great many subjects—on gods or the coming to be of the universe—that are completely and perfectly consistent and accurate. Instead, if we can come up with accounts no less likely than any, we ought to be content, keeping in mind that both I, the speaker, and you, the judges, are only human. So we should accept the likely tale on these matters. It behooves us not to look for anything beyond this.

Socrates:: Bravo, Timaeus! By all means! We must accept it as you say we should. This overture of yours was marvellous. Go on now and let us have the work itself.

Timaeus:: Very well then. Now why did he who framed this whole universe of becoming frame it? Let us state the reason why: He was good, and one who is good can never become jealous of anything. And so, being free of jealousy, he wanted everything to become as much like himself as was possible. In fact, men of wisdom will tell you (and you couldn't do better than to accept their claim) that this, more than anything else, was the most preeminent reason for the origin of the world's coming to be. The god wanted everything to be good and nothing to be bad so far as that was possible, and so he took over all that was visible—not at rest but in discordant and disorderly motion—and brought it from a state of disorder to one of order, because he believed that order was in every way better than disorder. Now it wasn't permitted (nor is it now) that one who is supremely good should do anything but what is best. Accordingly, the god reasoned and concluded that in the realm of things naturally visible no unintelligent thing could as a whole be better than anything which does possess intelligence as a whole, and he further concluded that it is impossible for anything to come to possess intelligence apart from soul. Guided by this reasoning, he put intelligence in soul, and soul in body, and so he constructed the universe. He wanted to produce a piece of work that would be as excellent and supreme as its nature would allow. This, then, in keeping with our likely account, is how we must say divine providence brought our world into being as a truly living thing, endowed with soul and intelligence.

This being so, we have to go on to speak about what comes next. When the maker made our world, what living thing did he make it resemble? Let us not stoop to think that it was any of those that have the natural character of a part, for nothing that is a likeness of anything incomplete could ever turn out beautiful. Rather, let us lay it down that the universe resembles more closely than anything else that Living Thing of which all other living things are parts, both individually and by kinds. For that Living Thing comprehends within itself all intelligible living things, just as our world is made up of us and all the other visible creatures. Since the god wanted nothing more than to make the world like the best of the intelligible things, complete in every way, he made it a single visible living thing, which contains within itself all the living things whose nature it is to share its kind.

Have we been correct in speaking of one universe, or would it have been more correct to say that there are many, in fact infinitely many universes? There is but one universe, if it is to have been crafted after its model. For that which contains all of the intelligible living things couldn't ever be one of a pair, since that would require there to be yet another Living Thing, the one that contained those two, of which they then would be parts, and then it would be more correct to speak of our universe as made in the likeness, now not of those two, but of that other, the one that contains them. So, in order that this living thing should be like the complete Living Thing in respect of uniqueness, the Maker made neither two, nor yet an infinite number of worlds. On the contrary, our universe came to be as the one and only thing of its kind, is so now and will continue to be so in the future.

Now that which comes to be must have bodily form, and be both visible and tangible, but nothing could ever become visible apart from fire, nor tangible without something solid, nor solid without earth. That is why, as he began to put the body of the universe together, the god came to make it out of fire and earth. But it isn't possible to combine two things well all by themselves, without a third; there has to be some bond between the two that unites them. Now the best bond is one that really and truly makes a unity of itself together with the things bonded by it, and this in the nature of things is best accomplished by proportion. For whenever of three numbers which are either solids or squares the middle term between any two of them is such that what the first term is to it, it is to the last, and, conversely, what the last term is to the middle, it is to the first, then, since the middle term turns out to be both first and last, and the last and the first likewise both turn out to be middle terms, they will all of necessity turn out to have the same relationship to each other, and, given this, will all be unified.

So if the body of the universe were to have come to be as a two dimensional plane, a single middle term would have sufficed to bind together its conjoining terms with itself. As it was, however, the universe was to be a solid, and solids are never joined together by just one middle term but always by two. Hence the god set water and air between fire and earth, and made them as proportionate to one another as was possible, so that what fire is to air, air is to water, and what air is to water, water is to earth. He then bound them together and thus he constructed the visible and tangible universe. This is the reason why these four particular constituents were used to beget the body of the world, making it a symphony of proportion. They bestowed friendship upon it, so that, having come together into a unity with itself, it could not be undone by anyone but the one who had bound it together.

Now each one of the four constituents was entirely used up in the process of building the world. The builder built it from all the fire, water, air and earth there was, and left no part or power of any of them out. His intentions in so doing were these: First, that as a living thing it should be as whole and complete as possible and made up of complete parts. Second, that it should be just one universe, in that nothing would be left over from which another one just like it could be made. Third, that it should not get old and diseased. He realized that when heat or cold or anything else that possesses strong powers surrounds a composite body from outside and attacks it, it destroys that body prematurely, brings disease and old age upon it and so causes it to waste away. That is why he concluded that he should fashion the world as a single whole, composed of all wholes, complete and free of old age and disease, and why he fashioned it that way. And he gave it a shape appropriate to the kind of thing it was. The appropriate shape for that living thing that is to contain within itself all the living things would be the one which embraces within itself all the shapes there are. Hence he gave it a round shape, the form of a sphere, with its center equidistant from its extremes in all directions. This of all shapes is the most complete and most like itself, which he gave to it because he believed that likeness is incalculably more excellent than unlikeness. And he gave it a smooth round finish all over on the outside, for many reasons. It needed no eyes, since there was nothing visible left outside it; nor did it need ears, since there was nothing audible there, either. There was no air enveloping it that it might need for breathing, nor did it need any organ by which to take in food or, again, expel it when it had been digested. For since there wasn't anything else, there would be nothing to leave it or come to it from anywhere. It supplied its own waste for its food. Anything that it did or experienced it was designed to do or experience within itself and by itself. For the builder thought that if it were self-sufficient, it would be a better thing than if it required other things.

And since it had no need to catch hold of or fend off anything, the god thought that it would be pointless to attach hands to it. Nor would it need feet or any support to stand on. In fact, he awarded it the movement suited to its body—that one of the seven motions which is especially associated with understanding and intelligence. And so he set it turning continuously in the same place, spinning around upon itself. All the other six motions he took away, and made its movement free of their wanderings. And since it didn't need feet to follow this circular path, he begat it without legs or feet.

Applying this entire train of reasoning to the god that was yet to be, the eternal god made it smooth and even all over, equal from the center, a whole and complete body itself, but also made up of complete bodies. In its center he set a soul, which he extended throughout the whole body, and with which he then covered the body outside. And he set it to turn in a circle, a single solitary universe, whose very excellence enables it to keep its own company without requiring anything else. For its knowledge of and friendship with itself is enough. All this, then, explains why this world which he begat for himself is a blessed god.

As for the world's soul, even though we are now embarking on an account of it after we've already given an account of its body, it isn't the case that the god devised it to be younger than the body. For the god would not have united them and then allow the elder to be ruled by the younger. We have a tendency to be casual and random in our speech, reflecting, no doubt, the whole realm of the casual and random of which we are a part. The god, however, gave priority and seniority to the soul, both in its coming to be and in the degree of its excellence, to be the body's mistress and to rule over it as her subject.

The components from which he made the soul and the way in which he made it were as follows: In between the Being that is indivisible and always changeless, and the one that is divisible and comes to be in the corporeal realm, he mixed a third, intermediate form of being, derived from the other two. Similarly, he made a mixture of the Same, and then one of the Different, in between their indivisible and their corporeal, divisible counterparts. And he took the three mixtures and mixed them together to make a uniform mixture, forcing the Different, which was hard to mix, into conformity with the Same. Now when he had mixed these two together with Being, and from the three had made a single mixture, he redivided the whole mixture into as many parts as his task required, each part remaining a mixture of the Same, the Different, and of Being. This is how he began the division: first he took one portion away from the whole, and then he took another, twice as large, followed by a third, one and a half times as large as the second and three times as large as the first. The fourth portion he took was twice as large as the second, the fifth three times as large as the third, the sixth eight times that of the first, and the seventh twenty-seven times that of the first.

After this he went on to fill the double and triple intervals by cutting off still more portions from the mixture and placing these between them, in such a way that in each interval there were two middle terms, one exceeding the first extreme by the same fraction of the extremes by which it was exceeded by the second, and the other exceeding the first extreme by a number equal to that by which it was exceeded by the second. These connections produced intervals of 3/2, 4/3, and 9/8 within the previous intervals. He then proceeded to fill all the 4/3 intervals with the 9/8 interval, leaving a small portion over every time. The terms of this interval of the portion left over made a numerical ratio of 256/243. And so it was that the mixture, from which he had cut off these portions, was eventually completely used up.

Next, he sliced this entire compound in two along its length, joined the two halves together center to center like an X, and bent them back in a circle, attaching each half to itself end to end and to the ends of the other half at the point opposite to the one where they had been joined together. He then included them in that motion which revolves in the same place without variation, and began to make the one the outer, and the other the inner circle. And he decreed that the outer movement should be the movement of the Same, while the inner one should be that of the Different. He made the movement of the Same revolve toward the right by way of the side, and that of the Different toward the left by way of the diagonal, and he made the revolution of the Same, i.e., the uniform, the dominant one in that he left this one alone undivided, while he divided the inner one six times, to make seven unequal circles. His divisions corresponded to the several double and triple intervals, of which there were three each. He set the circles to go in contrary directions: three to go at the same speed, and the other four to go at speeds different from both each other's and that of the other three. Their speeds, however, were all proportionate to each other.

Once the whole soul had acquired a form that pleased him, he who formed it went on to fashion inside it all that is corporeal, and, joining center to center, he fitted the two together. The soul was woven together with the body from the center on out in every direction to the outermost limit of the universe, and covered it all around on the outside. And, revolving within itself, it initiated a divine beginning of unceasing, intelligent life for all time. Now while the body of the universe had come to be as a visible thing, the soul was invisible. But even so, because it shares in reason and harmony, the soul came to be as the most excellent of all the things begotten by him who is himself most excellent of all that is intelligible and eternal.

Because the soul is a mixture of the Same, the Different and Being (the three components we've described), because it was divided up and bound together in various proportions, and because it circles round upon itself, then, whenever it comes into contact with something whose being is scatterable or else with something whose being is indivisible, it is stirred throughout its whole self. It then declares what exactly that thing is the same as, or what it is different from, and in what respect and in what manner, as well as when, it turns out that they are the same or different and are characterized as such. This applies both to the things that come to be, and to those that are always changeless. And when this contact gives rise to an account that is equally true whether it is about what is different or about what is the same, and is borne along without utterance or sound within the self-moved thing, then, whenever the account concerns anything that is perceptible, the circle of the Different goes straight and proclaims it throughout its whole soul. This is how firm and true opinions and convictions come about. Whenever, on the other hand, the account concerns any object of reasoning, and the circle of the Same runs well and reveals it, the necessary result is understanding and knowledge. And if anyone should ever call that in which these two arise, not soul but something else, what he says will be anything but true.

Now when the Father who had begotten the universe observed it set in motion and alive, a thing that had come to be as a shrine for the everlasting gods, he was well pleased, and in his delight he thought of making it more like its model still. So, as the model was itself an everlasting Living Thing, he set himself to bringing this universe to completion in such a way that it, too, would have that character to the extent that was possible. Now it was the Living Thing's nature to be eternal, but it isn't possible to bestow eternity fully upon anything that is begotten. And so he began to think of making a moving image of eternity: at the same time as he brought order to the universe, he would make an eternal image, moving according to number, of eternity remaining in unity. This number, of course, is what we now call “time.”

For before the heavens came to be, there were no days or nights, no months or years. But now, at the same time as he framed the heavens, he devised their coming to be. These all are parts of time, and was and will be are forms of time that have come to be. Such notions we unthinkingly but incorrectly apply to everlasting being. For we say that it was and is and will be, but according to the true account only is, is appropriately said of it. Was and will be are properly said about the becoming that passes in time, for these two are motions. But that which is always changeless and motionless cannot become either older or younger in the course of time— it neither ever became so, nor is it now such that it has become so, nor will it ever be so in the future. And all in all, none of the characteristics that becoming has bestowed upon the things that are borne about in the realm of perception are appropriate to it. These, rather, are forms of time that have come to be—time that imitates eternity and circles according to number. And what is more, we also say things like these: that what has come to be is what has come to be, that what is coming to be is what is coming to be, and also that what will come to be is what will come to be, and that what is not is what is not. None of these expressions of ours is accurate. But I don’t suppose this is a good time right now to be too meticulous about these matters.

Time, then, came to be together with the universe so that just as they were begotten together, they might also be undone together, should there ever be an undoing of them. And it came to be after the model of that which is sempiternal, so that it might be as much like its model as possible. For the model is something that has being for all eternity, while it, on the other hand, has been, is, and shall be for all time, forevermore. Such was the reason, then, such the god's design for the coming to be of time, that he brought into being the Sun, the Moon and five other stars, for the begetting of time. These are called "wanderers," and they came to be in order to set limits to and stand guard over the numbers of time. When the god had finished making a body for each of them, he placed them into the orbits traced by the period of the Different—seven bodies in seven orbits. He set the Moon in the first circle, around the earth, and the Sun in the second, above it. The Dawn-bearer (the Morning Star, or Venus) and the star said to be sacred to Hermes (Mercury) he set to run in circles that equal the Sun's in speed, though they received the power contrary to its power. As a result, the Sun, the star of Hermes and the Dawn-bearer alike overtake and are overtaken by one another. As for the other bodies, if I were to spell out where he situated them, and all his reasons for doing so, my account, already a digression, would make more work than its purpose calls for. Perhaps later on we could at our leisure give this subject the exposition it deserves.

Now when each of the bodies that were to cooperate in producing time had come into the movement prepared for carrying it and when, bound by bonds of soul, these bodies had been begotten with life and learned their assigned tasks, they began to revolve along the movement of the Different, which is oblique and which goes through the movement of the Same, by which it is also dominated. Some bodies would move in a larger circle, others in a smaller one, the latter moving more quickly and the former more slowly. Indeed, because of the movement of the Same, the ones that go around most quickly appeared to be overtaken by those going more slowly, even though in fact they were overtaking them. For as it revolves, this movement gives to all these circles a spiral twist, because they are moving forward in two contrary directions at once. As a result, it makes that body which departs most slowly from it—and it is the fastest of the movements—appear closest to it.

And so that there might be a conspicuous measure of their relative slowness and quickness with which they move along in their eight revolutions, the god kindled a light in the orbit second from the earth, the light that we now call the Sun. Its chief work would be to shine upon the whole universe and to bestow upon all those living things appropriately endowed and taught by the revolution of the Same and the uniform, a share in number. In this way and for these reasons night-and-day, the period of a single circling, the wisest one, came to be. A month has passed when the Moon has completed its own cycle and overtaken the Sun; a year when the Sun has completed its own cycle.

As for the periods of the other bodies, all but a scattered few have failed to take any note of them. Nobody has given them names or investigated their numerical measurements relative to each other. And so people are all but ignorant of the fact that time really is the wanderings of these bodies, bewilderingly numerous as they are and astonishingly variegated. It is none the less possible, however, to discern that the perfect number of time brings to completion the perfect year at that moment when the relative speeds of all eight periods have been completed together and, measured by the circle of the Same that moves uniformly, have achieved their consummation. This, then, is how as well as why those stars were begotten which, on their way through the universe, would have turnings. The purpose was to make this living thing as like as possible to that perfect and intelligible Living Thing, by way of imitating its sempiternity.

Prior to the coming to be of time, the universe had already been made to resemble in various respects the model in whose likeness the god was making it, but the resemblance still fell short in that it didn’t yet contain all the living things that were to have come to be within it. This remaining task he went on to perform, casting the world into the nature of its model. And so he determined that the living thing he was making should possess the same kinds and numbers of living things as those which, according to the discernment of Intellect, are contained within the real Living Thing. Now there are four of these kinds: first, the heavenly race of gods; next, the kind that has wings and travels through the air; third, the kind that lives in water; and fourth, the kind that has feet and lives on land. The gods he made mostly out of fire, to be the brightest and fairest to the eye. He made them well-rounded, to resemble the universe, and placed them in the wisdom of the dominant circle [i.e., of the Same], to follow the course of the universe. He spread the gods throughout the whole heaven to be a true adornment [kosmos] for it, an intricately wrought whole. And he bestowed two movements upon each of them. The first was rotation, an unvarying movement in the same place, by which the god would always think the same thoughts about the same things. The other was revolution, a forward motion under the dominance of the circular carrying movement of the Same and uniform. With respect to the other five motions, the gods are immobile and stationary, in order that each of them may come as close as possible to attaining perfection.

This, then, was the reason why all those everlasting and unwandering stars—divine living things which stay fixed by revolving without variation in the same place—came to be. Those that have turnings and thus wander in that sort of way came to be as previously described.

The Earth he devised to be our nurturer, and, because it winds around the axis that stretches throughout the universe, also to be the maker and guardian of day and night. Of the gods that have come to be within the universe, Earth ranks as the foremost, the one with greatest seniority.

To describe the dancing movements of these gods, their juxtapositions and the back-circlings and advances of their circular courses on themselves; to tell which of the gods come into line with one another at their conjunctions and how many of them are in opposition, and in what order and at which times they pass in front of or behind one another, so that some are occluded from our view to reappear once again, thereby bringing terrors and portents of things to come to those who cannot reason—to tell all this without the use of visible models would be labor spent in vain. We will make do with this account, and so let this be the conclusion of our discussion of the nature of the visible and generated gods.

As for the other spiritual beings [daimones], it is beyond our task to know and speak of how they came to be. We should accept on faith the assertions of those figures of the past who claimed to be the offspring of gods. They must surely have been well informed about their own ancestors. So we cannot avoid believing the children of gods, even though their accounts lack plausible or compelling proofs. Rather, we should follow custom and believe them, on the ground that what they claim to be reporting are matters of their own concern. Accordingly, let us accept their account of how these gods came to be and state what it is.

Earth and Heaven gave birth to Ocean and Tethys, who in turn gave birth to Phorcys, Cronus and Rhea and all the gods in that generation. Cronus and Rhea gave birth to Zeus and Hera, as well as all those siblings who are called by names we know. These in turn gave birth to yet another generation. In any case, when all the gods had come to be, both the ones who make their rounds conspicuously and the ones who present themselves only to the extent that they are willing, the begetter of this universe spoke to them. This is what he said:

"O gods, works divine whose maker and father I am, whatever has come to be by my hands cannot be undone but by my consent. Now while it is true that anything that is bound is liable to being undone, still, only one who is evil would consent to the undoing of what has been well fitted together and is in fine condition. This is the reason why you, as creatures that have come to be, are neither completely immortal nor exempt from being undone. Still, you will not be undone nor will death be your portion, since you have received the guarantee of my will—a greater, more sovereign bond than those with which you were bound when you came to be. Learn now, therefore, what I declare to you. There remain still three kinds of mortal beings that have not yet been begotten; and as long as they have not come to be, the universe will be incomplete, for it will still lack within it all the kinds of living things it must have if it is to be sufficiently complete. But if these creatures came to be and came to share in life by my hand, they would rival the gods. It is you, then, who must turn yourselves to the task of fashioning these living things, as your nature allows. This will assure their mortality, and this whole universe will really be a completed whole. Imitate the power I used in causing you to be. And to the extent that it is fitting for them to possess something that shares our name of 'immortal', something described as divine and ruling within those of them who always consent to follow after justice and after you, I shall begin by sowing that seed, and then hand it over to you. The rest of the task is yours. Weave what is mortal to what is immortal, fashion and beget living things. Give them food, cause them to grow, and when they perish, receive them back again."

When he had finished this speech, he turned again to the mixing bowl he had used before, the one in which he had blended and mixed the soul of the universe. He began to pour into it what remained of the previous ingredients and to mix them in somewhat the same way, though these were no longer invariably and constantly pure, but of a second and third grade of purity. And when he had compounded it all, he divided the mixture into a number of souls equal to the number of the stars and assigned each soul to a star. He mounted each soul in a carriage, as it were, and showed it the nature of the universe. He described to them the laws that had been foreordained: They would all be assigned one and the same initial birth, so that none would be less well treated by him than any other. Then he would sow each of the souls into that instrument of time suitable to it, where they were to acquire the nature of being the most god-fearing of living things, and, since humans have a twofold nature, the superior kind should be such as would from then on be called "man." So, once the souls were of necessity implanted in bodies, and these bodies had things coming to them and leaving them, the first innate capacity they would of necessity come to have would be sense perception, which arises out of forceful disturbances. This they all would have. The second would be love, mingled with pleasure and pain. And they would come to have fear and spiritedness as well, plus whatever goes with having these emotions, as well as all their natural opposites. And if they could master these emotions, their lives would be just, whereas if they were mastered by them, they would be unjust. And if a person lived a good life throughout the due course of his time, he would at the end return to his dwelling place in his companion star, to live a life of happiness that agreed with his character. But if he failed in this, he would be born a second time, now as a woman. And if even then he still could not refrain from wickedness, he would be changed once again, this time into some wild animal that resembled the wicked character he had acquired. And he would have no rest from these toilsome transformations until he had dragged that massive accretion of fire-water-air-earth into conformity with the revolution of the Same and uniform within him, and so subdued that turbulent, irrational mass by means of reason. This would return him to his original condition of excellence.

Having set out all these ordinances to them—which he did to exempt himself from responsibility for any evil they might afterwards do—the god proceeded to sow some of them into the Earth, some into the Moon, and others into the various other instruments of time. After the sowing, he handed over to the young gods the task of weaving mortal bodies. He had them make whatever else remained that the human soul still needed to have, plus whatever goes with those things. He gave them the task of ruling over these mortal living things and of giving them the finest, the best possible guidance they could give, without being responsible for any evils these creatures might bring upon themselves.

When he had finished assigning all these tasks, he proceeded to abide at rest in his own customary nature. His children immediately began to attend to and obey their father's assignment. Now that they had received the immortal principle of the mortal living thing, they began to imitate the craftsman who had made them. They borrowed parts of fire, earth, water and air from the world, intending to pay them back again, and bonded together into a unity the parts they had taken, but not with those indissoluble bonds by which they themselves were held together. Instead, they proceeded to fuse them together with copious rivets so small as to be invisible, thereby making each body a unit made up of all the components. And they went on to invest this body—into and out of which things were to flow—with the orbits of the immortal soul. These orbits, now bound within a mighty river, neither mastered that river nor were mastered by it, but tossed it violently and were violently tossed by it. Consequently the living thing as a whole did indeed move, but it would proceed in a disorderly, random and irrational way that involved all six of the motions. It would go forwards and backwards, then back and forth to the right and the left, and upwards and downwards, wandering every which way in these six directions. For mighty as the nourishment-bearing billow was in its ebb and flow, mightier still was the turbulence produced by the disturbances caused by the things that struck against the living things. Such disturbances would occur when the body encountered and collided with external fire (i.e., fire other than the body's own) or for that matter with a hard lump of earth or with the flow of gliding waters, or when it was caught up by a surge of air-driven winds. The motions produced by all these encounters would then be conducted through the body to the soul, and strike against it. (That is no doubt why these motions as a group came afterwards to be called "sensations," as they are still called today.) It was just then, at that very instant, that they produced a very long and intense commotion. They cooperated with the continually flowing channel to stir and violently shake the orbits of the soul. They completely bound that of the Same by flowing against it in the opposite direction, and held it fast just as it was beginning to go its way. And they further shook the orbit of the Different right through, with the result that they twisted every which way the three intervals of the double and the three of the triple, as well as the middle terms of the ratios of 3/2, 4/3 and 9/8 that connect them. [These agitations did not undo them, however,] because they cannot be completely undone except by the one who had bound them together. They mutilated and disfigured the circles in every possible way so that the circles barely held together and though they remained in motion, they moved without rhyme or reason, sometimes in the opposite direction, sometimes sideways and sometimes upside down—like a man upside down, head propped against the ground and holding his feet up against something. In that position his right side will present itself both to him and to those looking at him as left, and his left side as right. It is this very thing—and others like it—that had such a dramatic effect upon the revolutions of the soul. Whenever they encounter something outside of them characterizable as same or different, they will speak of it as "the same as" something, or as "different from" something else when the truth is just the opposite, so proving themselves to be misled and unintelligent. Also, at this stage souls do not have a ruling orbit taking the lead. And so when certain sensations come in from outside and attack them, they sweep the soul's entire vessel along with them. It is then that these revolutions, however much in control they seem to be, are actually under their control. All these disturbances are no doubt the reason why even today and not only at the beginning, whenever a soul is bound within a mortal body, it at first lacks intelligence. But as the stream that brings growth and nourishment diminishes and the soul's orbits regain their composure, resume their proper courses and establish themselves more and more with the passage of time, their revolutions are set straight, to conform to the configuration each of the circles takes in its natural course. They then correctly identify what is the same and what is different, and render intelligent the person who possess them. And to be sure, if such a person also gets proper nurture to supplement his education, he'll turn out perfectly whole and healthy, and will have escaped the most grievous of illnesses. But if he neglects this, he'll limp his way through life and return to Hades uninitiated and unintelligent.

But this doesn't happen until later. Our present subject, on the other hand, needs a more detailed treatment. We must move on to treat the prior questions—the ones that deal with how bodies came to be, part by part, as well as the soul. What were the gods' reasons, what was their plan when they caused these to be? In discussing these questions we shall hold fast to what is most likely, and proceed accordingly.

Copying the revolving shape of the universe, the gods bound the two divine orbits into a ball-shaped body, the part that we now call our head. This is the most divine part of us, and master of all our other parts. They then assembled the rest of the body and handed the whole of it to the head, to be in its service. They intended it to share in all the motions there were to be. To keep the head from rolling around on the ground without any way of getting up over its various high spots and out of the low, they gave it the body as a vehicle to make its way easy. This is the reason why the body came to have length and grow four limbs that could flex and extend themselves, divinely devised for the purpose of getting about. Holding on and supporting itself with these limbs, it would be capable of making its way through all regions, while carrying at the top the dwelling place of that most divine, most sacred part of ourselves. This is how as well as why we have all grown arms and legs. And considering the front side to be more honorable and more commanding than the back, the gods gave us the ability to travel for the most part in this direction. Human beings no doubt ought to have the front sides of their bodies distinguishable from and dissimilar to their backs, and so the gods began by setting the face on that side of the head, the soul's vessel. They bound organs inside it to provide completely for the soul, and they assigned this side, the natural front, to be the part that takes the lead.

The eyes were the first of the organs to be fashioned by the gods, to conduct light. The reason why they fastened them within the head is this. They contrived that such fire as was not for burning but for providing a gentle light should become a body, proper to each day. Now the pure fire inside us, cousin to that fire, they made to flow through the eyes: so they made the eyes—the eye as a whole but its middle in particular—close-textured, smooth and dense, to enable them to keep out all the other, coarser stuff, and let that kind of fire pass through pure by itself. Now whenever daylight surrounds the visual stream, like makes contact with like and coalesces with it to make up a single homogeneous body aligned with the direction of the eyes. This happens wherever the internal fire strikes and presses against an external object it has connected with. And because this body of fire has become uniform throughout and thus uniformly affected, it transmits the motions of whatever it comes in contact with as well as of whatever comes in contact with it, to and through the whole body until they reach the soul. This brings about the sensation we call "seeing." At night, however, the kindred fire has departed and so the visual stream is cut off. For now it exits only to encounter something unlike itself. No longer able to bond with the surrounding air, which now has lost its fire, it undergoes changes and dies out. So it not only stops seeing, but even begins to induce sleep. For when the eyelids—which the gods devised to keep eyesight safe—are closed, they shut in the power of the internal fire, which then disperses and evens out the internal motions, and when these have been evened out, a state of quietness ensues. And if this quietness is deep, one falls into an all but dreamless sleep. But if some fairly strong motions remain, they produce images similar in kind and in number to the kind of motions they are, and the kind of regions in which they remain—images which, though formed within, are recalled upon waking as external objects.

And so there is no longer any difficulty in understanding how images are produced in mirrors or in any other smooth reflecting surfaces. On such occasions the internal fire joins forces with the external fire, to form on the smooth surface a single fire which is reshaped in a multitude of ways. So once the fire from the face comes to coalesce with the fire from sight on the smooth and bright surface, you have the inevitable appearance of all images of this sort. What is left will appear as right, because the parts of the fire from sight connect with the opposite parts of the fire from the face, contrary to the usual manner of encounter. But, on the other hand, what is right does appear as right, and what is left as left whenever light switches sides in the process of coalescing with the light with which it coalesces. And this happens whenever the mirror's smooth surface is curled upwards on both sides, thereby bending the right part of the fire from sight towards the left, and the left part towards the right. And when this same smooth surface is turned along the length of the face [i.e., vertically], it makes the whole object appear upside down, because it bends the lower part of the ray toward the top, and the upper part toward the bottom.

Now all of the above are among the auxiliary causes employed in the service of the god as he does his utmost to bring to completion the character of what is most excellent. But because they make things cold or hot, compact or disperse them, and produce all sorts of similar effects, most people regard them not as auxiliary causes, but as the actual causes of all things. Things like these, however, are totally incapable of possessing any reason or understanding about anything. We must pronounce the soul to be the only thing there is that properly possesses understanding. The soul is an invisible thing, whereas fire, water, earth and air have all come to be as visible bodies. So anyone who is a lover of understanding and knowledge must of necessity pursue as primary causes those that belong to intelligent nature, and as secondary all those belonging to things that are moved by others and that set still others in motion by necessity. We too, surely, must do likewise: we must describe both types of causes, distinguishing those which possess understanding and thus fashion what is beautiful and good, from those which, when deserted by intelligence, produce only haphazard and disorderly effects every time.

Let us conclude, then, our discussion of the accompanying auxiliary causes that gave our eyes the power which they now possess. We must next speak of that supremely beneficial function for which the god gave them to us. As my account has it, our sight has indeed proved to be a source of supreme benefit to us, in that none of our present statements about the universe could ever have been made if we had never seen any stars, sun or heaven. As it is, however, our ability to see the periods of day-and-night, of months and of years, of equinoxes and solstices, has led to the invention of number, and has given us the idea of time and opened the path to inquiry into the nature of the universe. These pursuits have given us philosophy, a gift from the gods to the mortal race whose value neither has been nor ever will be surpassed. I'm quite prepared to declare this to be the supreme good our eyesight offers us. Why then should we exalt all the lesser good things, which a non-philosopher struck blind would "lament and bewail in vain"? Let us rather declare that the cause and purpose of this supreme good is this: the god invented sight and gave it to us so that we might observe the orbits of intelligence in the universe and apply them to the revolutions of our own understanding. For there is a kinship between them, even though our revolutions are disturbed, whereas the universal orbits are undisturbed. So once we have come to know them and to share in the ability to make correct calculations according to nature, we should stabilize the straying revolutions within ourselves by imitating the completely unstraying revolutions of the god.

Likewise, the same account goes for sound and hearing—these too are the gods' gifts, given for the same purpose and intended to achieve the same result. Speech was designed for this very purpose—it plays the greatest part in its achievement. And all such composition as lends itself to making audible musical sound is given in order to express harmony, and so serves this purpose as well. And harmony, whose movements are akin to the orbits within our souls, is a gift of the Muses, if our dealings with them are guided by understanding, not for irrational pleasure, for which people nowadays seem to make use of it, but to serve as an ally in the fight to bring order to any orbit in our souls that has become unharmonized, and make it concordant with itself. Rhythm, too, has likewise been given us by the Muses for the same purpose, to assist us. For with most of us our condition is such that we have lost all sense of measure, and are lacking in grace.

Now in all but a brief part of the discourse I have just completed I have presented what has been crafted by Intellect. But I need to match this account by providing a comparable one concerning the things that have come about by Necessity. For this ordered world is of mixed birth: it is the offspring of a union of Necessity and Intellect. Intellect prevailed over Necessity by persuading it to direct most of the things that come to be toward what is best, and the result of this subjugation of Necessity to wise persuasion was the initial formation of this universe. So if I’m to tell the story of how it really came to be in this way, I'd also have to introduce the character of the Straying Cause—how it is its nature to set things adrift. I shall have to retrace my steps, then, and, armed with a second starting point that also applies to these same things, I must go back once again to the beginning and start my present inquiry from there, just as I did with my earlier one.

We shall of course have to study the intrinsic nature of fire, water, air and earth prior to the heaven’s coming to be, as well as the properties they had then. So far no one has as yet revealed how these four came to be. We tend to posit them as the elemental “letters” of the universe and tell people they are its “principles” on the assumption that they know what fire and the other three are. In fact, however, they shouldn’t even be compared to syllables. Only a very unenlightened person might be expected to make such a comparison. So let me now proceed with my treatment in the following way: for the present I cannot state “the principle” or “principles” of all things, or however else I think about them, for the simple reason that it is difficult to show clearly what my view is if I follow my present manner of exposition. Please do not expect me to do so then. I couldn’t convince even myself that I could be right to commit myself to undertaking a task of such magnitude. I shall keep to what I stated at the beginning, the virtue of likely accounts, and so shall try right from the start to say about things, both individually and collectively, what is no less likely than any—more likely, in fact, than what I have said before. Let us therefore at the outset of this discourse call upon the god to be our savior this time, too, to give us safe passage through a strange and unusual exposition, and lead us to a view of what is likely. And so let me begin my speech again.

The new starting point in my account of the universe needs to be more complex than the earlier one. Then we distinguished two kinds, but now we must specify a third, one of a different sort. The earlier two sufficed for our previous account: one was proposed as a model, intelligible and always changeless, a second as an imitation of the model, something that possesses becoming and is visible. We did not distinguish a third kind at the time, because we thought that we could make do with the two of them. Now, however, it appears that our account compels us to attempt to illuminate in words a kind that is difficult and vague. What must we suppose it to do and to be? This above all: it is a receptacle of all becoming— its wetnurse, as it were.

However true that statement may be, we must nevertheless describe it more clearly. This is a difficult task, particularly because it requires us to raise a preliminary problem about fire and the other three:

It is difficult to say of each of them—in a way that employs a reliable and stable account—which one is the sort of thing one should really call water rather than fire, or which one, one should call some one of these rather than just any and every one of them. What problem, then, do they present for us to work through in likely fashion? And then how and in what manner are we to go on to speak about this third kind?

First, we see (or think we see) the thing that we have just now been calling water condensing and turning to stones and earth. Next, we see this same thing dissolving and dispersing, turning to wind and air, and air, when ignited, turning to fire. And then we see fire being condensed and extinguished and turning back to the form of air, and air coalescing and thickening and turning back into cloud and mist. When these are compressed still more we see them turning into flowing water, which we see turning to earth and stones once again. In this way, then, they transmit their coming to be one to the other in a cycle, or so it seems. Now then, since none of these appears ever to remain the same, which one of them can one categorically assert, without embarrassment, to be some particular thing, this one, and not something else? One can't. Rather, the safest course by far is to propose that we speak about these things in the following way: what we invariably observe becoming different at different times—fire for example—to characterize that, i.e., fire, not as "this," but each time as "what is such," and speak of water not as "this," but always as "what is such." And never to speak of anything else as "this," as though it has some stability, of all the things at which we point and use the expressions "that" and "this" and so think we are designating something. For it gets away without abiding the charge of "that" and "this," or any other expression that indicts them of being stable. It is in fact safest not to refer to it by any of these expressions. Rather, "what is such"—coming around like what it was, again and again—that's the thing to call it in each and every case. So fire—and generally everything that has becoming—it is safest to call "what is altogether such." But that in which they each appear to keep coming into being and from which they subsequently pass out of being, that's the only thing to refer to by means of the expressions "that" and "this." A thing that is some "such" or other, however,—hot or white, say, or any one of the opposites, and all things constituted by these—should be called none of these things [i.e., "this" or "that"].

I must make one more effort to describe it, more clearly still. Suppose you were molding gold into every shape there is, going on non-stop remolding one shape into the next. If someone then were to point at one of them and ask you, "What is it?," your safest answer by far, with respect to truth, would be to say, "gold," but never "triangle" or any of the other shapes that come to be in the gold, as though it is these, because they change even while you’re making the statement. However, that answer, too, should be satisfactory, as long as the shapes are willing to accept “what is such” as someone’s designation. This has a degree of safety.

Now the same account, in fact, holds also for that nature which receives all the bodies. We must always refer to it by the same term, for it does not depart from its own character in any way. Not only does it always receive all things, it has never in any way whatever taken on any characteristic similar to any of the things that enter it. Its nature is to be available for anything to make its impression upon, and it is modified, shaped and reshaped by the things that enter it. These are the things that make it appear different at different times. The things that enter and leave it are imitations of those things that always are, imprinted after their likeness in a marvellous way that is hard to describe. This is something we shall pursue at another time. For the moment, we need to keep in mind three types of things: that which comes to be, that in which it comes to be, and that after which the thing coming to be is modeled, and which is the source of its coming to be. It is in fact appropriate to compare the receiving thing to a mother, the source to a father, and the nature between them to their offspring. We also must understand that if the imprints are to be varied, with all the varieties there to see, this thing upon which the imprints are to be formed could not be well prepared for that role if it were not itself devoid of any of those characters that it is to receive from elsewhere. For if it resembled any of the things that enter it, it could not successfully copy their opposites or things of a totally different nature whenever it were to receive them. It would be showing its own face as well. This is why the thing that is to receive in itself all the elemental kinds must be totally devoid of any characteristics.

Think of people who make fragrant ointments. They expend skill and ingenuity to come up with something just like this [i.e., a neutral base], to have on hand to start with. The liquids that are to receive the fragrances they make as odorless as possible. Or think of people who work at impressing shapes upon soft materials. They emphatically refuse to allow any such material to already have some definite shape. Instead, they'll even it out and make it as smooth as it can be. In the same way, then, if the thing that is to receive repeatedly throughout its whole self the likenesses of the intelligible objects, the things which always are— if it is to do so successfully, then it ought to be devoid of any inherent characteristics of its own. This, of course, is the reason why we shouldn't call the mother or receptacle of what has come to be, of what is visible or perceivable in every other way, either earth or air, fire or water, or any of their compounds or their constituents. But if we speak of it as an invisible and characterless sort of thing, one that receives all things and shares in a most perplexing way in what is intelligible, a thing extremely difficult to comprehend, we shall not be misled. And in so far as it is possible to arrive at its nature on the basis of what we've said so far, the most correct way to speak of it may well be this: the part of it that gets ignited appears on each occasion as fire, the dampened part as water, and parts as earth or air in so far as it receives the imitations of these.

But we must prefer to conduct our inquiry by means of rational argument. Hence we should make a distinction like the following: Is there such a thing as a Fire by itself? Do all these things of which we always say that each of them is something "by itself" really exist? Or are the things we see, and whatever else we perceive through the body, the only things that possess this kind of actuality, so that there is absolutely nothing else besides them at all? Is our perpetual claim that there exists an intelligible Form for each thing a vacuous gesture, in the end nothing but mere talk? Now we certainly will not do justice to the question before us if we dismiss it, leaving it undecided and unadjudicated, and just insist that such things exist, but neither must we append a further lengthy digression to a discourse already quite long. If, however, a significant distinction formulated in few words were to present itself, that would suit our present needs best of all. So here's how I cast my own vote: If understanding and true opinion are distinct, then these "by themselves" things definitely exist—these Forms, the objects not of our sense perception, but of our understanding only. But if—as some people think—true opinion does not differ in any way from understanding, then all the things we perceive through our bodily senses must be assumed to be the most stable things there are. But we do have to speak of understanding and true opinion as distinct, of course, because we can come to have one without the other, and the one is not like the other. It is through instruction that we come to have understanding, and through persuasion that we come to have true belief. Understanding always involves a true account while true belief lacks any account. And while understanding remains unmoved by persuasion, true belief gives in to persuasion. And of true belief, it must be said, all men have a share, but of understanding, only the gods and a small group of people do.

Since these things are so, we must agree that that which keeps its own form unchangingly, which has not been brought into being and is not destroyed, which neither receives into itself anything else from anywhere else, nor itself enters into anything else anywhere, is one thing. It is invisible—it cannot be perceived by the senses at all—and it is the role of understanding to study it. The second thing is that which shares the other's name and resembles it. This thing can be perceived by the senses, and it has been begotten. It is constantly borne along, now coming to be in a certain place and then perishing out of it. It is apprehended by opinion, which involves sense perception. And the third type is space, which exists always and cannot be destroyed. It provides a fixed state for all things that come to be. It is itself apprehended by a kind of bastard reasoning that does not involve sense perception, and it is hardly even an object of conviction. We look at it as in a dream when we say that everything that exists must of necessity be somewhere, in some place and occupying some space, and that that which doesn't exist somewhere, whether on earth or in heaven, doesn't exist at all.

We prove unable to draw all these distinctions and others related to them—even in the case of that unsleeping, truly existing reality—because our dreaming state renders us incapable of waking up and stating the truth, which is this: Since that for which an image has come to be is not at all intrinsic to the image, which is invariably borne along to picture something else, it stands to reason that the image should therefore come to be in something else, somehow clinging to being, or else be nothing at all. But that which really is receives support from the accurate, true account—that as long as the one is distinct from the other, neither of them ever comes to be in the other in such a way that they at the same time become one and the same, and also two.

Let this, then, be a summary of the account I would offer, as computed by my "vote." There are being, space, and becoming, three distinct things which existed even before the universe came to be.

Now as the wetnurse of becoming turns watery and fiery and receives the character of earth and air, and as it acquires all the properties that come with these characters, it takes on a variety of visible aspects, but because it is filled with powers that are neither similar nor evenly balanced, no part of it is in balance. It sways irregularly in every direction as it is shaken by those things, and being set in motion it in turn shakes them. And as they are moved, they drift continually, some in one direction and others in others, separating from one another. They are winnowed out, as it were, like grain that is sifted by winnowing sieves or other such implements. They are carried off and settle down, the dense and heavy ones in one direction, and the rare and light ones to another place.

That is how at that time the four kinds were being shaken by the receiver, which was itself agitating like a shaking machine, separating the kinds most unlike each other furthest apart and pushing those most like each other closest together into the same region. This, of course, explains how these different kinds came to occupy different regions of space, even before the universe was set in order and constituted from them at its coming to be. Indeed, it is a fact that before this took place the four kinds all lacked proportion and measure, and at the time the ordering of the universe was undertaken, fire, water, earth and air initially possessed certain traces of what they are now. They were indeed in the condition one would expect thoroughly god-forsaken things to be in. So, finding them in this natural condition, the first thing the god then did was to give them their distinctive shapes, using forms and numbers.

Here is a proposition we shall always affirm above all else: The god fashioned these four kinds to be as perfect and excellent as possible, when they were not so before. It will now be my task to explain to you what structure each of them acquired, and how each came to be. My account will be an unusual one, but since you are well schooled in the fields of learning in terms of which I must of necessity proceed with my exposition, I’m sure you’ll follow me.

First of all, everyone knows, I'm sure, that fire, earth, water and air are bodies. Now everything that has bodily form also has depth. Depth, moreover, is of necessity comprehended within surface, and any surface bounded by straight lines is composed of triangles. Every triangle, moreover, derives from two triangles, each of which has one right angle and two acute angles. Of these two triangles, one [the isosceles right-angled triangle] has at each of the other two vertices an equal part of a right angle, determined by its division by equal sides; while the other [the scalene right-angled triangle] has unequal parts of a right angle at its other two vertices, determined by the division of the right angle by unequal sides. This, then, we presume to be the originating principle of fire and of the other bodies, as we pursue our likely account in terms of Necessity. Principles yet more ultimate than these are known only to the god, and to any man he may hold dear.

We should now say which are the most excellent four bodies that can come to be. They are quite unlike each other, though some of them are capable of breaking up and turning into others and vice-versa. If our account is on the mark, we shall have the truth about how earth and fire and their proportionate intermediates [water and air] came to be. For we shall never concede to anyone that there are any visible bodies more excellent than these, each conforming to a single kind. So we must wholeheartedly proceed to fit together the four kinds of bodies of surpassing excellence, and to declare that we have come to grasp their natures well enough.

Of the two [right-angled] triangles, the isosceles has but one nature, while the scalene has infinitely many. Now we have to select the most excellent one from among the infinitely many, if we are to get a proper start. So if anyone can say that he has picked out another one that is more excellent for the construction of these bodies, his victory will be that of a friend, not an enemy. Of the many [scalene right-angled] triangles, then, we posit as the one most excellent, surpassing the others, that one from [a pair of] which the equilateral triangle is constructed as a third figure.

Why this is so is too long a story to tell now. But if anyone puts this claim to the test and discovers that it isn't so, his be the prize, with our congratulations. So much, then, for the selection of the two triangles out of which the bodies of fire and the other bodies are constructed—the [right-angled] isosceles, and [the right-angled] scalene whose longer side squared is always triple its shorter side squared [i.e., the half-equilateral].

At this point we need to formulate more precisely something that was not stated clearly earlier. For then it appeared that all four kinds of bodies could turn into one another by successive stages. But the appearance is wrong. While there are indeed four kinds of bodies that come to be from the [right-angled] triangles we have selected, three of them come from triangles that have unequal sides, whereas the fourth alone is fashioned out of isosceles triangles. Thus not all of them have the capacity of breaking up and turning into one another, with a large number of small bodies turning into a small number of large ones and vice-versa. There are three that can do this. For all three are made up of a single type of triangle, so that when once the larger bodies are broken up, the same triangles can go to make up a large number of small bodies, assuming shapes appropriate to them. And likewise, when numerous small bodies are fragmented into their triangles, these triangles may well combine to make up some single massive body belonging to another kind.

So much, then, for our account of how these bodies turn into one another. Let us next discuss the form that each of them has come to have, and the various numbers that have combined to make them up.

Leading the way will be the primary form [the tetrahedron], the tiniest structure, whose elementary triangle is the one whose hypotenuse is twice the length of its shorter side. Now when a pair of such triangles are juxtaposed along the diagonal [i.e., their hypotenuses] and this is done three times, and their diagonals and short sides converge upon a single point as center, the result is a single equilateral triangle, composed of six such triangles. When four of these equilateral triangles are combined, a single solid angle is produced at the junction of three plane angles. This, it turns out, is the angle which comes right after the most obtuse of the plane angles. And once four such solid angles have been completed, we get the primary solid form, which is one that divides the entire circumference [sc. of the sphere in which it is inscribed] into equal and similar parts.

The second solid form [the octahedron] is constructed out of the same triangles which, however, are now arranged in eight equilateral triangles and produce a single solid angle out of four plane angles. And when six such solid angles have been produced, the second body has reached its completion.

Now the third body [the icosahedron] is made up of a combination of one hundred and twenty of the elementary triangles, and of twelve solid angles, each enclosed by five plane equilateral triangles. This body turns out to have twenty equilateral triangular faces. And let us take our leave of this one of the elementary triangles, the one that has begotten the above three kinds of bodies and turn to the other one, the isosceles [right-angled] triangle, which has begotten the fourth [the cube]. Arranged in sets of four whose right angles come together at the center, the isosceles triangle produced a single equilateral quadrangle [i.e., a square]. And when six of these quadrangles were combined together, they produced eight solid angles, each of which was constituted by three plane right angles. The shape of the resulting body so constructed is a cube, and it has six quadrangular equilateral faces.

One other construction, a fifth, still remained, and this one the god used for the whole universe, embroidering figures on it.

Anyone following this whole line of reasoning might very well be puzzled about whether we should say that there are infinitely many worlds or a finite number of them. If so, he would have to conclude that to answer, “infinitely many,” is to take the view of one who is really “unfinished” in things he ought to be “finished” in. He would do better to stop with the question whether we should say that there’s really just one world or five and be puzzled about that. Well, our “probable account” answer declares there to be but one world, a god—though someone else, taking other things into consideration, will come to a different opinion. We must set him aside, however.

Let us now assign to fire, earth, water and air the structures which have just been given their formations in our speech. To earth let us give the cube, because of the four kinds of bodies earth is the most immobile and the most pliable—which is what the solid whose faces are the most secure must of necessity turn out to be, more so than the others. Now of the [right-angled] triangles we originally postulated, the face belonging to those that have equal sides has a greater natural stability than that belonging to triangles that have unequal sides, and the surface that is composed of the two triangles, the equilateral quadrangle [the square], holds its position with greater stability than does the equilateral triangle, both in their parts and as wholes. Hence, if we assign this solid figure to earth, we are preserving our “likely account.” And of the solid figures that are left, we shall next assign the least mobile of them to water, to fire the most mobile, and to air the one in between. This means that the tiniest body belongs to fire, the largest to water, and the intermediate one to air—and also that the body with the sharpest edges belongs to fire, the next sharpest to air, and the third sharpest to water. Now in all these cases the body that has the fewest faces is of necessity the most mobile, in that it, more than any other, has edges that are the sharpest and best fit for cutting in every direction. It is also the lightest, in that it is made up of the least number of identical parts. The second body ranks second in having these same properties, and the third ranks third. So let us follow our account, which is not only likely but also correct, and take the solid form of the pyramid that we saw constructed as the element or the seed of fire. And let us say that the second form in order of generation is that of air, and the third that of water.

Now we must think of all these bodies as being so small that due to their small size none of them, whatever their kind, is visible to us individually. When, however, a large number of them are clustered together, we do see them in bulk. And in particular, as to the proportions among their numbers, their motions and their other properties, we must think that when the god had brought them to complete and exact perfection (to the degree that Necessity was willing to comply obediently), he arranged them together proportionately.

Given all we have said so far about the kinds of elemental bodies, the following account [of their transformations] is the most likely: When earth encounters fire and is broken up by fire’s sharpness, it will drift about— whether the breaking up occurred within fire itself, or within a mass of air or water— until its parts meet again somewhere, refit themselves together and become earth again. The reason is that the parts of earth will never pass into another form. But when water is broken up into parts by fire or even by air, it could happen that the parts recombine to form one corpuscle of fire and two of air. And the fragments of air could produce, from any single particle that is broken up, two fire corpuscles. And conversely, whenever a small amount of fire is enveloped by a large quantity of air or water or perhaps earth and is agitated inside them as they move, and in spite of its resistance is beaten and shattered to bits, then any two fire corpuscles may combine to constitute a single form of air. And when air is overpowered and broken down, then two and one half entire forms of air will be consolidated into a single, entire form of water.

Let us recapitulate and formulate our account of these transformations as follows: Whenever one of the other kinds is caught inside fire and gets cut up by the sharpness of fire's angles and edges, then if it is reconstituted as fire, it will stop getting cut. The reason is that a thing of any kind that is alike and uniform is incapable of effecting any change in, or being affected by, anything that is similar to it. But as long as something involved in a transformation has something stronger than it to contend with, the process of its dissolution will continue non-stop. And likewise, when a few of the smaller corpuscles are surrounded by a greater number of bigger ones, they will be shattered and quenched. The quenching will stop when these smaller bodies are willing to be reconstituted into the form of the kind that prevailed over them, and so from fire will come air, and from air, water. But if these smaller corpuscles are in process of turning into these and one of the other kinds encounters them and engages them in battle, their dissolution will go on non-stop until they are either completely squeezed and broken apart and escape to their own likes, or else are defeated, and, melding from many into one, they are assimilated to the kind that prevailed over them, and come to share its abode from then on. And, what is more, as they undergo these processes, they all exchange their territories: for as a result of the Receptacle’s agitation the masses of each of the kinds are separated from one another, with each occupying its own region, but because some parts of a particular kind do from time to time become unlike their former selves and like the other kinds, they are carried by the shaking towards the region occupied by whatever masses they are becoming like to.

These, then, are the sorts of causes by which the unalloyed primary bodies have come to be. Now the fact that different varieties are found within their respective forms is to be attributed to the constructions of each of the elementary triangles. Each of these two constructions did not originally yield a triangle that had just one size, but triangles that were both smaller and larger, numerically as many as there are varieties within a given form. That is why when they are mixed with themselves and with each other they display an infinite variety, which those who are to employ a likely account in their study of nature ought to take note of.

Now as for motion and rest, unless there is agreement on the manner and the conditions in which these two come to be, we will have many obstacles to face in our subsequent course of reasoning. Although we have already said something about them, we need to say this as well: there will be no motion in a state of uniformity. For it is difficult, or rather impossible, for something to be moved without something to set it in motion, or something to set a thing in motion without something to be moved by it. When either is absent, there is no motion, but [when they are present] it is quite impossible for them to be uniform. And so let us always presume that rest is found in a state of uniformity and to attribute motion to non-uniformity. The latter, moreover, is caused by inequality, the origin of which we have already discussed.

We have not explained, however, how it is that the various corpuscles have not reached the point of being thoroughly separated from each other kind by kind, so that their transformations into each other and their movement [toward their own regions] would have come to a halt. So let us return to say this about it: Once the circumference of the universe has comprehended the [four] kinds, then, because it is round and has a natural tendency to gather in upon itself, it constricts them all and allows no empty space to be left over. This is why fire, more than the other three, has come to infiltrate all of the others, with air in second place, since it is second in degree of subtlety, and so on for the rest. For the bodies that are generated from the largest parts will have the largest gaps left over in their construction, whereas the smallest bodies will have the tiniest. Now this gathering, contracting process squeezes the small parts into the gaps inside the big ones. So now, as the small parts are placed among the large ones and the smaller ones tend to break up the larger ones while the larger tend to cause the smaller to coalesce, they all shift, up and down, into their own respective regions. For as each changes in quantity, it also changes the position of its region. This, then, is how and why the occurrence of non-uniformity is perpetually preserved, and so sets these bodies in perpetual motion, both now and in the future without interruption.

Next, we should note that there are many varieties of fire that have come to be. For example, there is both flame and the effluence from flame which, while it doesn't burn, gives light to the eyes. And then there is the residue of flame which is left in the embers when the flame has gone out. The same goes for air. There is the brightest kind that we call “aether,” and also the murkiest, “mist” and “darkness.” Then there are other, nameless sorts which result from inequality among the triangles. The varieties of water can first of all be divided into two groups, the liquid and the liquifiable. Because the former possesses water parts that are not only unequal but also small, it turns out to be mobile, both in itself and when acted upon by something else. This is due to its non-uniformity and the configuration of its shape. The other type of water, composed of large and uniform kinds, is rather more immobile and heavy, compacted as it is by its uniformity. But when fire penetrates it and begins to break it up, it loses its uniformity, and once that is lost it is more susceptible to motion. When it has become quite mobile it is spread out upon the ground under pressure from the air surrounding it. Each of these changes has its own name: “melting” for the disintegration of its bulk and “flowing” for the spreading on the ground. But when, conversely, the fire is expelled from it, then, since the fire does not pass into a void, pressure is exerted upon the surrounding air, which in turn compresses the still mobile liquid mass into the places previously occupied by the fire and mixes it with itself. As it is being compressed, the mass regains its uniformity now that fire, the agent of non-uniformity, has left the scene, and it resettles into its own former state. The departure of the fire is called “cooling,” and the compression that occurs when the fire is gone is called “jelling.” Of all these types of water that we have called liquifiable, the one that consists of the finest, the most uniform parts and has proved to be the most dense, one that is unique in its kind and tinged with brilliant yellow, is gold, our most precious possession, filtered through rocks and thereby compacted. And gold’s offshoot, which because of its density is extremely hard and has a black color, is called adamant. Another has parts that approximate gold and comes in more than one variety. In terms of density, it is in one way denser than gold and includes a small, fine part of earth, so that it is harder. But it is actually lighter than gold, because it has large gaps inside of it. This, it turns out, is copper, one variety of the bright, jelled kinds of water. Whenever the earth part of the mixture separates off again from the rest in the passage of time, this part, called verdigris, becomes visible by itself.

As for going further and giving an account of other stuffs of this sort along the lines of the likely stories we have been following, that is no complicated matter. And should one take a break and lay aside accounts about the things that always are, deriving instead a carefree pleasure from surveying the likely accounts about becoming, he would provide his life with a moderate and sensible diversion. So shall we, then, at this time give free rein to such a diversion and go right on to set out the next likelihoods on these subjects, as follows:

Take now the water that is mixed with fire. It is fine and liquid and on account of its mobility and the way it rolls over the ground it is called “liquid/’ It is soft, moreover, in that its faces, being less firm than those of earth, give way to it. When this water is separated from its fire and air and is isolated, it becomes more uniform, and it is pressed together into itself by the things that leave it. So compacted, the water above the earth which is most affected by this change turns to hail, while that on earth turns to ice. Some water is not affected quite so much, being still only half compacted. Such water above the earth becomes snow while that on the earth becomes what is called “frost,” from dew that is congealed.

Now most of the varieties of water which are mixed with one another are collectively called “saps,” because they have been filtered through plants that grow out of the earth. Because they are mixed, each of them has its own degree of non-uniformity. Many of these varieties are nameless, though four of them, all with fire in them, are particularly conspicuous and so have been given names. First, there is wine, which warms not only the body but the soul as well. Second, there are the various oils, which are smooth and divide the ray of sight and for that reason glisten, appearing bright and shiny to the eye: these include resin, castor oil, olive oil and others that share their properties. And third, there is what is most commonly called honey, which includes all that relaxes the taste passages of the mouth back to their natural state, and which by virtue of this property conveys a sense of sweetness. Fourth, there is what has been named tart juice, quite distinct from all the other saps. It is a foamy stuff, and is caustic and hence hazardous to the flesh.

As for the varieties of earth, first, such earth as has been filtered through water turns into a stony body in something like the following way: When the water that is mixed with it disintegrates in the mixing process, it is transformed into the form of air, and, once it has turned into air, it thrusts its way upwards toward its own region. And since there is no void above it, it pushes aside the air next to it. And when this air, heavy as it is, is pressed and poured around the mass of earth, it squeezes it hard and compresses it to fill the places vacated by the recently formed air. When so compressed by air, earth is insoluble in water and constitutes itself as stone. The more beautiful kind of stone is stone that is transparent and made up of equal and uniform parts; the uglier kind is just the opposite. Second, there is the kind of earth from which moisture has been completely expelled by a swiftly burning fire and which thus comes to have a rather more brittle constitution than the first kind of earth. This is a kind to which the name “pottery” has been given. Sometimes, however, moisture gets left in and we get earth that is made liquifiable by fire. When it has cooled it turns to stone that is black in color (i.e., lava). Then, thirdly, there are the two varieties of earth that both alike are the residue of a mixture of a great quantity of water. They are briny, made up of the finest parts of earth, and turn out to be semi-solid and water soluble again. One of these is soda, a cleansing agent against oil and dirt; the other is salt, which is well suited to enhance various blends of flavor and has, not unreasonably, proven itself to be a stuff pleasing to the gods.

There are also compounds of earth and water which are soluble by fire but not by water. These are compacted in this way for the following sort of reason: Neither air nor fire will dissolve masses of earth, because air and fire consist of parts that by nature are smaller than are the gaps within earth. They thus pass without constraint through the wide gaps of a mass of earth, leaving it intact and undissolved. But since the parts of water are naturally bigger, they must force their way through, and in so doing they undo and dissolve the earth. For water alone can in this way dissolve earth that isn't forcibly compressed, but when earth is compressed nothing but fire can dissolve it. That is because fire is the only thing left that can penetrate it. So also, only fire can disperse water that has been compressed with the greatest force, whereas both fire and air can disperse water that is in a looser state. Air does it by entering the gaps, and fire by breaking up the triangles. The only way in which air that has been condensed under force can be broken up is into its elemental triangles, and even when it is not forcibly compressed only fire can dissolve it.

So as for these bodies that are mixtures of earth and water, as long as the gaps within a given mass of earth are occupied by its own water which is tightly packed within the gaps, the water parts that come charging upon it from the outside have no way of getting into the mass and so flow around the whole of it, leaving it undissolved. The fire parts, however, do penetrate the gaps within the water parts and hence as fire they do to water what water did to earth. They alone, it turns out, cause this body, this partnership of earth and water to come apart and become fluid. These compounds of earth and water include not only bodies that have less water in them than earth, such as glass and generally all stone formations that can be called liquifiable, but also bodies that have more water than earth, namely all those that have the consistency of wax or of incense.

We have now pretty much completed our presentation of the kinds of bodies that are distinguished by their multifarious shapes, their combinations and their inter transformations. Now we must try to shed some light on what has caused them to come to have the properties they do. First, we need at every step in our discourse to appeal to the existence of sense perception, but we have so far discussed neither the coming to be of flesh, or of what pertains to flesh, nor the part of the soul that is mortal. It so happens, however, that we cannot give an adequate account of these matters without referring to perceptual properties, but neither can we give an account of the latter without referring to the former, and to treat them simultaneously is all but impossible. So we must start by assuming the one or the other, and later revisit what we have assumed. Let's begin by taking for granted for now the existence of body and soul. This will allow our account of these properties to succeed the account we've just given of the elemental kinds.

First, then, let us see what we mean when we call fire hot. Let's look at it in this way: We notice how fire acts on our bodies by dividing and cutting them. We are all well aware that the experience is a sharp one. The fineness of fire's edges, the sharpness of its angles, the minuteness of its parts and the swiftness of its motion—all of which make fire severely piercing so that it makes sharp cuts in whatever it encounters—must be taken into consideration as we recall how its shape came to be. It is this substance, more than any other, that divides our bodies throughout and cuts them up into small pieces, thereby giving us the property (as well as the name [kermatizein]) that we now naturally call hot [thermon].

What the opposite property is, is quite obvious; we should not, however, keep anything left out of our account. As the larger parts of the moisture surrounding our bodies penetrate our bodies and push out the smaller parts, but are unable to take up the places vacated by those smaller parts, they compress the moisture within us and congeal it by rendering it in a state of motionlessness in place of a state of moving non-uniformity, by virtue of the uniformity and compression so introduced. But anything which is being unnaturally compressed has a natural tendency to resist such compression, and pushes itself outward, in the opposite direction. This resistance, this shaking is called "shivering" and "chill," and the experience as a whole, as well as what brings it about, has come to have the name cold.

Hard we call whatever our flesh gives way to; soft, whatever gives way to our flesh. And this is how they are relative to each other. Whatever stands upon a small base tends to give way. The form composed of quadrangles, however, is the least liable to being displaced because its bases are very secure, and that which is compacted to its maximum density is particularly resistant to being displaced.

Heavy and light can be most clearly explained if we examine them in conjunction with what we call above and below. It is entirely wrong to hold that there are by nature two separate regions, divorced from and entirely opposite one another, the one the region “below,” toward which anything that has physical mass tends to move, and the other the region “above” toward which everything makes its way only under force. For given that the whole heaven is spherical, all the points that are situated as extremes at an equal distance from the center must by their nature be extremes of just the same sort, and we must take it that the center, being equidistant from the extremes, is situated at the point that is the opposite to all the extremes. Now if this is the universe’s natural constitution, which of the points just mentioned could you posit as “above” or “below” without justly giving the appearance of using totally inappropriate language? There is no justification for describing the universe’s central region either as a natural “above” or a natural “below,” but just as “at the center.” And the region at the circumference is, to be sure, not the center, but neither is one of its parts so distinguished from any other that it is related to the center in a specific way more so than any of the parts opposite to it. What contrary terms could you apply to something that is by nature all alike in every direction? How could you think to use such terms appropriately? If, further, there is something solid and evenly balanced at the center of the universe, it could not move to any of the extreme points, because these are all alike in all directions. But if you could travel around it in a circle, you would repeatedly take a position at your own antipodes and call the very same part of it now the part “above,” and then the part “below.” For the whole universe, as we have just said, is spherical, and to say that some region of it is its “above,” and another its “below,” makes no sense. The origin of these terms and the subjects to which they really apply, which explain how we have become accustomed to using them in dividing the world as a whole in this way, we must resolve by adopting the following supposition: Imagine a man stepping onto that region of the universe that is the particular province of fire, where the greatest mass of fire is gathered together, and toward which other fire moves. Imagine, further, that he has the power to remove some parts of the fire and place them on scales. When he raises the beam and drags the fire into the alien air, applying force to it, clearly the lesser quantity of fire somehow gives way to his force more easily than the greater. For when two things are raised by one and the same exertion, the lesser quantity will invariably yield more readily and the greater (which offers more resistance) less readily, to the force applied. And so the large quantity will be described as heavy and moving downward, and the small one as light and moving upward. Now this is the very thing we must detect ourselves doing in our own region. When we stand on the earth and weigh out one earth-like thing against another, and sometimes some earth itself, we drag these things by force, contrary to their natural tendency, into the alien air. While both of them tend to cling to what is akin to them, nevertheless the smaller one will yield sooner and more readily than the larger one to the force we apply that introduces it into the alien stuff. Now this is what we call light, and the region into which we force it to go we call above; their opposites we call heavy and below. Now the things [having any of these designations] necessarily differ relatively to one another, because the various masses of the elemental kinds of body occupy opposite regions: what in one region is light, heavy, below or above will all be found to become, or to be, directly opposite to, or at an angle to, or in any and every different direction from, what is light, heavy, below or above in the opposite region. In fact, this is the one thing that should be understood to apply in all these cases: the path towards its own kind is what makes a thing moving along it “heavy” and the region into which it moves, “below,” whereas the other set of terms [“light” and “above”] are for things behaving the other way. This, then, concludes our account of what causes [things to have] these properties.

As for smooth and rough, I take it that anyone could discern the explanation of those properties and communicate it to someone else: roughness results from the combination of hardness with non-uniformity, while smoothness is the result of uniformity’s contribution to density.

The most important point that remains concerning the properties that have a common effect upon the body as a whole, pertains to the causes of pleasures and pains in the cases we have described as well as all cases in which sensations are registered throughout the bodily parts, sensations which are also simultaneously accompanied by pains and pleasures in those parts. With every property, whether perceived or not, let us take up the question of the causes of pleasure or pain in the following way, recalling the distinction made in the foregoing between what is easily moved and what is hard to move. This is the way in which we must pursue all that we intend to comprehend. When even a minor disturbance affects that which is easily moved by nature, the disturbance is passed on in a chain reaction with some parts affecting others in the same way as they were affected, until it reaches the center of consciousness and reports the property that produced the reaction. On the other hand, something that is hard to move remains fixed and merely experiences the disturbance without passing it on in any chain reaction. It does not disturb any of its neighboring parts, so that in the absence of some parts passing on the disturbance to others, the initial disturbance affecting them fails to move on into the living thing as a whole and renders the disturbance unperceived. This is true of our bones and hair and of the other mostly earth-made parts that we possess. But the former is true of our sight and hearing in particular, and this is due to the fact that their chief inherent power is that of air and of fire.

This, then, is what we should understand about pleasure and pain: an unnatural disturbance that comes upon us with great force and intensity is painful, while its equally intense departure, leading back to the natural state, is pleasant. One that is mild and gradual is not perceived, whereas the opposite is the case with the opposite disturbance. Further, one that occurs readily can be completely perceived, more so than any other, though neither pleasure nor pain is involved. Take, for example, those involved in the act of seeing. Earlier we described the ray of sight as a body that comes into being with the daylight as an extension of ourselves. The cuttings, the burnings and whatever else it undergoes don't cause any pains in it, nor does the return to its former state yield any pleasures. Its perceptions are the more vivid and clear the more it is affected and the greater the number of things it encounters and makes contact with, for there is absolutely no violence involved when it is severed [by the cutting and burning, etc.] and reconstituted. Bodies consisting of larger parts, on the other hand, won't easily give way to what acts upon them. They pass on the motions they receive to the entire body, and so they do get pleasures and pains—pains when they are alienated from their natural condition and pleasures when they are once again restored to it. All those bodies which experience only gradual departures from their normal state or gradual depletions but whose replenishments are intense and substantial are bodies that are unaware of their depletions but not of their replenishments, and hence they introduce very substantial pleasures in the mortal part of the soul but not any pains. This is clear in the case of fragrances. But all those bodies whose alienations are intense while their restorations to their former states are but gradual and slow, pass on motions that are entirely contrary to those mentioned just before. Again, this clearly turns out to be the case when the body suffers burns or cuts.

We have now pretty much covered those disturbances that affect the whole body in a common way, as well as all the terms that have come to be applied to the agents that produce them. We must now try to discuss, if we can, those that take place in our various particular parts, and, as before, their causes, which lie in the agents that produce them. First, then, we need to shed what light we can on what we left untreated earlier when we talked about tastes, and these are the properties specifically connected to the tongue. It seems that these, too, in common with most other properties, come about as a result of contractions and dilations, but apart from that, these tongue-related properties seem rather more than any of the others to involve roughness and smoothness. Now as earth-like parts penetrate the area around the tiny vessels that act as testers for the tongue and reach down to the heart, they impact upon the moist, soft flesh of the tongue and are melted away. In the process they contract the vessels and dry them up. When they tend to be rather rough, we taste them as sour; when less rough, as tangy. Things that rinse the vessels and wash the entire area around the tongue are all called bitter when they do so to excess and so assault the tongue as to dissolve some of it, as soda actually can do. When they are not as strong as soda and effect only a moderate rinsing, they taste salty to us. They have none of the harsh bitterness, and we find them rather agreeable. Things that absorb the heat of the mouth, by which they are also worn smooth, are ignited and in their turn return their fire to that which made them hot. Their lightness carries them up to the senses in the head, as they cut any and everything they come up against. Because this is what they do, things of this sort have all been called pungent. On the other hand, there are those things which have been refined by the process of decomposition and which then intrude themselves into the narrow vessels. These are proportioned both to the earth parts and those of air that are contained within the vessels, so that they agitate the earth and air parts and cause them to be stirred one around the other. As these are being stirred, they surround one another, and, as parts of one sort intrude themselves into parts of another, they make hollows which envelop the parts that go inside. So when a hollow envelope of moisture, whether earthy or pure, as the case may be, is stretched around air, we get moist vessels of air, hollow spheres of water. Some of these, those that form a transparent enclosure consisting of a pure moisture are called "bubbles"; those, on the other hand, whose moisture is earthy and agitates and rises upward all at once are called by the terms "effervescence" and "fermentation." That which causes these disturbances is called acid to the taste.

There is a disturbance that is the opposite of all the ones we have just discussed, one that is the effect of an opposite cause. Whenever the composition of the moistened parts that enter the vessels of the tongue is such that it is congruent with the natural condition of the tongue, these entering parts make smooth and lubricate the roughened parts and in some cases constrict while in others they relax the parts that have been abnormally dilated or contracted. They decisively restore all those parts back to their natural position. As such, they prove to be a cure for the violent disturbances [just discussed], being fully pleasant and agreeable to one and all, and are called sweet.

So much for the subject of tastes. As for the power belonging to the nostrils, there are no types within it. This is because a smell is always a "half-breed." None of the elemental shapes, as it happens, has the proportions required for having any odor. The vessels involved in our sense of smell are too narrow for the varieties of earth and water parts, yet too wide for those of earth and air. Consequently no one has ever perceived any odor coming from these elemental bodies. Things give off odors when they either get damp or decay, or melt or evaporate; for when water changes to air or air to water, odors are given off in the transition. All odors collectively are either vapor or mist, mist being what passes from air to water, and vapor what passes from water to air, and this is why odors as a group turn out to be finer than water, yet grosser than air. Their character becomes clear when one strains to draw one's breath through something that obstructs one's breathing. There will be no odor that filters through. All that comes through is just the breath itself, devoid of any odor.

These variations among odors, then, form two sets, neither of which has a name, since they do not consist of a specific number of simple types. Let us draw the only clear distinction we can draw here, that between the pleasant and the offensive. The latter of these irritates and violates the whole upper body from the top of the head to the navel, while the former soothes that area and welcomes it back to its natural state.

A third kind of perception that we want to consider is hearing. We must describe the causes that produce the properties connected with this perception. In general, let us take it that sound is the percussion of air by way of the ears upon the brain and the blood and transmitted to the soul, and that hearing is the motion caused by the percussion that begins in the head and ends in the place where the liver is situated. And let us take it that whenever the percussion is rapid, the sound is high-pitched, and that the slower the percussion, the lower the pitch. A regular percussion produces a uniform, smooth sound, while a contrary one produces one that is rough. A forceful percussion produces a loud sound, while a contrary one produces one that is soft. But we must defer discussion of harmonization in sounds to a later part of our discourse.

The fourth and remaining kind of perception is one that includes a vast number of variations within it, and hence it requires subdivision. Collectively, we call these variations colors. Color is a flame which flows forth from bodies of all sorts, with its parts proportional to our sight so as to produce perception. At an earlier point in our discourse we treated only the causes that led to the origination of the ray of sight; now, at this point, it is particularly appropriate to provide a well-reasoned account of colors.

Now the parts that move from the other objects and impinge on the ray of sight are in some cases smaller, in others larger than, and in still other cases equal in size to, the parts of the ray of sight itself. Those that are equal are imperceptible, and these we naturally call transparent. Those that are larger contract the ray of sight while those that are smaller, on the other hand, dilate it, and so are "cousin" to what is cold or hot in the case of the flesh, and, in the case of the tongue, with what is sour, or with all those things that generate heat and that we have therefore called "pungent." So black and white, it turns out, are properties of contraction and dilation, and are really the same as these other properties, though in a different class, which is why they present a different appearance. This, then, is how we should speak of them: white is what dilates the ray of sight, and black is what does the opposite.

Now when a more penetrating motion of a different type of fire pounces on the ray of sight and dilates it right up to the eyes, and forces its way through the very passages within the eyeballs and melts them, it discharges from those passages a glob of fire and water which we call a tear. The penetrating motion itself consists of fire, and as it encounters fire from the opposite direction, then, as the one fire leaps out from the eyes like a lightning flash and the other enters them but is quenched by the surrounding moisture, the resulting turmoil gives rise to colors of every hue. The disturbance so produced we call “dazzling,” and that which produces it we name bright and brilliant.

On the other hand, the type of fire that is intermediate between white and bright is one that reaches the moisture in the eyes and blends with it, but is not brilliant. As the fire shines through the moisture with which it is mixed, it yields the color of blood, which we call red. And when bright is mixed with red and white, we get orange. But it would be unwise to state the proportions among them, even if one could know them. It is impossible, even approximately, to provide a proof or a likely account on these matters.

Now red mixed with black and white is of course purple. When this combination is burnt further and more black is mixed with it, we get violet. Gray is a mixture of black and white, and the mixture of orange and gray produces amber. Beige comes from white mixed with orange. White combined with bright and immersed in a saturated black produces a cobalt blue color, which, when blended with white, becomes turquoise. A mixture of amber with black yields green. As for the other hues, it should be fairly clear from the above cases by what mixtures they are to be represented in a way that preserves our “likely story.” But if anyone in considering these matters were to put them to an actual test, he would demonstrate his ignorance of the difference between the human and the divine. It is god who possesses both the knowledge and power required to mix a plurality into a unity and, conversely, to dissolve a unity into a plurality, while no human being could possess either of these, whether at the present time or at any time in the future.

And so all these things were taken in hand, their natures being determined then by necessity in the way we've described, by the craftsman of the most perfect and excellent among things that come to be, at the time when he brought forth that self-sufficient, most perfect god. Although he did make use of the relevant auxiliary causes, it was he himself who gave their fair design to all that comes to be. That is why we must distinguish two forms of cause, the divine and the necessary. First, the divine, for which we must search in all things if we are to gain a life of happiness to the extent that our nature allows, and second, the necessary, for which we must search for the sake of the divine. Our reason is that without the necessary, those other objects, about which we are serious, cannot on their own be discerned, and hence cannot be comprehended or partaken of in any other way.

We have now sorted out the different kinds of cause, which lie ready for us like lumber for carpenters. From them we are to weave together the remainder of our account. So let us briefly return to our starting point and quickly proceed to the same place from which we arrived at our present position. Let us try to put a final "head" on our account, one that fits in with our previous discussion.

To repeat what was said at the outset, the things we see were in a condition of disorderliness when the god introduced as much proportionality into them and in as many ways—making each thing proportional both to itself and to other things—as was possible for making them be commensurable and proportionate. For at the time they had no proportionality at all, except by chance, nor did any of them qualify at all for the names we now use to name them, names like fire, water, etc. All these things, rather, the god first gave order to, and then out of them he proceeded to construct this universe, a single living thing that contains within itself all living things, mortal or immortal. He himself fashioned those that were divine, but assigned his own progeny the task of fashioning the generation of those that were mortal.

They imitated him: having taken the immortal origin of the soul, they proceeded next to encase it within a round mortal body [the head], and to give it the entire body as its vehicle. And within the body they built another kind of soul as well, the mortal kind, which contains within it those dreadful but necessary disturbances: pleasure, first of all, evil's most powerful lure; then pains, that make us run away from what is good; besides these, boldness also and fear, foolish counselors both; then also the spirit of anger hard to assuage, and expectation easily led astray. These they fused with unreasoning sense perception and all-venturing lust, and so, as was necessary, they constructed the mortal type of soul. In the face of these disturbances they scrupled to stain the divine soul only to the extent that this was absolutely necessary, and so they provided a home for the mortal soul in another place in the body, away from the other, once they had built an isthmus as boundary between the head and the chest by situating a neck between them to keep them apart. Inside the chest, then, and in what is called the trunk they proceeded to enclose the mortal type of soul. And since one part of the mortal soul was naturally superior to the other, they built the hollow of the trunk in sections, dividing them the way that women's quarters are divided from men's. They situated the midriff between the sections to serve as a partition. Now the part of the mortal soul that exhibits manliness and spirit, the ambitious part, they settled nearer the head, between the midriff and the neck, so that it might listen to reason and together with it restrain by force the part consisting of appetites, should the latter at any time refuse outright to obey the dictates of reason coming down from the citadel. The heart, then, which ties the veins together, the spring from which blood courses with vigorous pulse throughout all the bodily members, they set in the guardhouse. That way, if spirit's might should boil over at a report from reason that some wrongful act involving these members is taking place—something being done to them from outside or even something originating from the appetites within—every bodily part that is sensitive may be keenly sensitized, through all the narrow vessels, to the exhortations or threats and so listen and follow completely. In this way the best part among them all can be left in charge.

The gods foreknew that the pounding of the heart (which occurs when one expects what one fears or when one's spirit is aroused) would, like all such swelling of the passions, be caused by fire. So they devised something to relieve the pounding: they implanted lungs, a structure that is first of all soft and without blood and that secondly contains pores bored through it like a sponge. This enables it to take in breath and drink and thereby cool the heart, bringing it respite and relaxation in the heat. That, then, is why they cut the passages of the windpipe down to the lungs, and situated the lungs around the heart like padding, so that when spirit within the heart should reach its peak, the heart might pound against something that gives way to it and be cooled down. By laboring less, it might be better able to join spirit in serving reason.

The part of the soul that has appetites for food and drink and whatever else it feels a need for, given the body's nature, they settled in the area between the midriff and the boundary toward the navel. In the whole of this region they constructed something like a trough for the body's nourishment. Here they tied this part of the soul down like a beast, a wild one, but one they could not avoid sustaining along with the others if a mortal race were ever to be. They assigned it its position there, to keep it ever feeding at its trough, living as far away as possible from the part that takes counsel, and making as little clamor and noise as possible, thereby letting the supreme part take its counsel in peace about what is beneficial for one and all. They knew that this part of the soul was not going to understand the deliverances of reason and that even if it were in one way or another to have some awareness of them, it would not have an innate regard for any of them, but would be much more enticed by images and phantoms night and day. Hence the god conspired with this very tendency by constructing a liver, a structure which he situated in the dwelling place of this part of the soul. He made it into something dense, smooth, bright and sweet, though also having a bitter quality, so that the force of the thoughts sent down from the mind might be stamped upon it as upon a mirror that receives the stamps and returns visible images. So whenever the force of the mind’s thoughts could avail itself of a congenial portion of the liver’s bitterness and threaten it with severe command, it could then frighten this part of the soul. And by infusing the bitterness all over the liver, it could project bilious colors onto it and shrink the whole liver, making it wrinkled and rough. It could curve and shrivel up the liver’s lobe and block up and close off its receptacles and portal fissures, thereby causing pains and bouts of nausea. And again, whenever thought’s gentle inspiration should paint quite opposite pictures, its force would bring respite from the bitterness by refusing to stir up or to make contact with a nature opposite to its own. It would instead use the liver’s own natural sweetness on it and restore the whole extent of it to be straight and smooth and free, and make that portion of the soul that inhabits the region around the liver gracious and well behaved, conducting itself with moderation during the night when, seeing that it has no share in reason and understanding, it practices divination by dreams. For our creators recalled their father's instruction to make the mortal race as excellent as possible, and so, redeeming even the base part of ourselves in this way, they set the center of divination here, so that it might have some grasp of truth.

The claim that god gave divination as a gift to human folly has good support: while he is in his right mind no one engages in divination, however divinely inspired and true it may be, but only when his power of understanding is bound in sleep or by sickness, or when some sort of possession works a change in him. On the other hand, it takes a man who has his wits about him to recall and ponder the pronouncements produced by this state of divination or possession, whether in sleep or while awake. It takes such a man to thoroughly analyze any and all visions that are seen, to determine how and for whom they signify some future, past or present good or evil. But as long as the fit remains on him, the man is incompetent to render judgment on his own visions and voices; As the ancient proverb well puts it, "Only a man of sound mind may know himself and conduct his own affairs." This is the reason why it is customary practice to appoint interpreters to render judgment on an inspired divination. These persons are called "diviners" by some who are entirely ignorant of the fact that they are expositors of utterances or visions communicated through riddles. Instead of "diviners," the correct thing to call them is, "interpreters of things divined."

This, then, explains why the liver's nature is what it is, and why it is situated in the region we say—it is for the purpose of divination. Now while each creature is still alive, an organ of this sort will display marks that are fairly clear, but once its life has gone, the organ turns blind and its divinations are too faint to display any clear marks.

Moreover, the neighboring organ situated on its left turns out to have a structure which is meant to serve the liver in keeping it bright and clean continuously, like a dust cloth provided for wiping a mirror, placed next to it and always available. Hence, whenever impurities of one sort or another, the effects of bodily illnesses, turn up all around the liver, the spleen, a loosely-woven organ with hollow spaces that contain no blood, cleans them all away and absorbs them. In consequence it becomes engorged with the impurities it has cleaned off, swells to great size and festers. Later, when the body's cleansing is complete, the swelling subsides, and the spleen once again shrinks back to its normal size.

So, as for our questions concerning the soul—to what extent it is mortal and to what extent divine; where its parts are situated, with what organs they are associated, and why they are situated apart from one another— that the truth has been told is something we could affirm only if we had divine confirmation. But that our account is surely at least a "likely" one is a claim we must risk, both now and as we proceed to examine the matter more closely. Let that be our claim, then.

Our next topic must be pursued along the same lines. This was to describe how the rest of the body came to be. The following train of reasoning should explain its composition best of all. The creators of our race knew that we were going to be undisciplined in matters of food and drink. They knew that our gluttony would lead us to consume much more than the moderate amount we needed. So, to prevent the swift destruction of our mortal race by diseases and to forestall its immediate, premature demise, they had the foresight to create the lower abdomen, as it's called, as a receptacle for storing the excess food and drink. They wound the intestines round in coils to prevent the nourishment from passing through so quickly that the body would of necessity require fresh nourishment just as quickly, thereby rendering it insatiable. Such gluttony would make our whole race incapable of philosophy and the arts, and incapable of heeding the most divine part within us.

As for flesh and bones and things of that nature, this is how it is. The starting point for all these was the formation of marrow. For life's chains, as long as the soul remains bound to the body, are bound within the marrow, giving roots for the mortal race. The marrow itself came to be out of other things. For the god isolated from their respective kinds those primary triangles which were undistorted and smooth and hence, owing to their exactness, were particularly well suited to make up fire, water, air and earth. He mixed them together in the right proportions, and from them made the marrow, a "universal seed" contrived for every mortal kind. Next, he implanted in the marrow the various types of soul and bound them fast in it. And in making his initial distribution, he proceeded immediately to divide the marrow into the number and kinds of shapes that matched the number and kinds of shapes that the types of soul were to possess, type by type. He then proceeded to mold the "field," as it were, that was to receive the divine seed, making it round, and called this portion of the marrow, "brain." Each living thing was at its completion to have a head to function as a container for this marrow. That, however, which was to hold fast the remaining, mortal part of the soul, he divided into shapes that were at once round and elongated, all of which he named "marrow." And from these as from anchors he put out bonds to secure the whole soul and so he proceeded to construct our bodies all around this marrow, beginning with the formation of solid bone as a covering for the whole of it.

This is how he constructed bone. He sifted earth that was pure and smooth, kneaded it and soaked it with marrow.

Next, he set this mixture in fire, and then dipped it in water, then back in fire, followed by water again. By moving it this way repeatedly from the one and then back to the other, he made it insoluble by both. He made use of this material in shaping a round, bony globe to enclose the brain, and left it with a narrow passage out. From the material he then proceeded to mold vertebrae to enclose marrow of the neck and back, and set them in place one underneath another, beginning with the head and proceeding along the whole length of the trunk, to function as pivots. And so, to preserve all of the seed, he fenced it in with a stony enclosure. In this enclosure he made joints, employing in their case the character of the Different situated between them to allow them to move and to flex.

Moreover, the god thought that bone as such was rather too brittle and inflexible, and also that repeatedly getting extremely hot and cold by turns would cause it to disintegrate and to destroy in short order the seed within it. That is why he contrived to make sinews and flesh. He bound all the limbs together with sinews that could contract and relax, and so enabled the body to flex about the pivots and to stretch itself out. The flesh he made as a defense against summer's heat and as protection against winter's cold. And, as protection against injuries, too, he made the flesh so that it would give way softly and gently to bodies like the felted coverings we wear. He made it to contain within itself a warm moisture that would come out as perspiration during summertime, when, by moistening the body on the outside, it would impart the body's own coolness to the whole of it. And conversely, in wintertime this moisture would provide an adequate defense, by means of this fire, against the frost which surrounds it and attacks it from outside. Such were the designs of him who molded us like wax: he made a mixture using water, fire and earth, which he adjusted together, and created a compound of acid and brine, a fermented mixture which he combined with the previous mixture, and so he formed flesh, sappy and soft. The sinews he made out of a mixture of bone and unfermented flesh, to make up a single yellow stuff whose character was intermediate between them both. That is the reason the sinews came to have a stretchier and tougher character than flesh, yet softer and more moist than bone. With these the god wrapped the bones and the marrow. First he bound the bones to each other with sinews, and then he laid a shroud of flesh upon them all.

All those bones that had more soul than others he proceeded to wrap in a very thin layer of flesh, while those that contained less he wrapped in a very thick layer of very dense flesh. And indeed, at the joints of the bones, where it appeared that reason did not absolutely require the presence of flesh, he introduced only a thin layer of flesh, so that the ability of the joints to flex would not be impeded, a condition that would have made it very difficult for the bodies to move. A further reason was this: if there were a thick layer of flesh there, packed extremely densely together, its hardness would cause a kind of insensibility, which would make thinking less retentive and more obscure. This he wanted to prevent.

This explains why thighs and calves, the area around the hips, arms (both upper and lower), and all other bodily parts where there are no joints as well as all the internal bones, are all fully provided with flesh. It is because they have only small amounts of soul in their marrow, and so are devoid of intelligence. On the other hand, all those bodily parts that do possess intelligence are less fleshy, except perhaps for a fleshy thing— the tongue, for example—that was created to be itself an organ of sensation. But in most cases it is as I said. For there is no way that anything whose generation and composition are a consequence of Necessity can accommodate the combination of thick bone and massive flesh with keen and responsive sensation. If these two characteristics had not refused their concomitance, our heads above all else would have been so constituted as to possess this combination, and the human race, crowned with a head fortified with flesh and sinews would have a life twice, or many more times as long, a healthier and less painful life than the one we have now. As it was, however, our makers calculated the pros and cons of giving our race greater longevity but making it worse, versus making it better, though less long-lived, and decided that the superior though shorter life-span was in every way preferable for everyone to the longer but inferior one. This is why they capped the head with a sparse layer of bone—and not with flesh and sinew, given that the head has no joints. For all these reasons, then, the head has turned out to be more sensitive and intelligent but also, in every man's case, much weaker than the body to which it is attached. With this in mind the god thus positioned sinews at the very edge of the head, around the neck, and welded them uniformly. To these sinews he fastened the ends of the jawbones underneath the face. The other sinews he shared out among all the limbs, fastening joint to joint.

Our makers fitted the mouth out with teeth, a tongue and lips in their current arrangement, to accommodate both what is necessary and what is best: they designed the mouth as the entry passage for what is necessary, and as the exit for what is best: for all that comes in and provides nourishment for the body is necessary, while that stream of speech that flows out through the mouth, that instrument of intelligence, is the fairest and best of all streams.

Moreover, the head couldn't be left to consist of nothing but bare bone, in view of the extremes of seasonal heat and cold. On the other hand, any mass of flesh with which it might be veiled couldn’t be allowed to make it dull and insensitive, either. And so, an outer layer, disproportionately large (the thing we now call “skin”), was separated off from the flesh [of the upper body] that wasn’t drying out completely. The moisture in the area of the brain enabled this layer to draw together toward itself and grow so as to envelop the head all around. Coming up under the sutures, this moisture watered it, and closed it together upon the crown, drawing it together in a knot, as it were. The sutures varied considerably, owing to the effect of the revolutions [in the head] and of the nourishment taken: the greater the conflict among these revolutions, the more numerous the sutures—the lesser the conflict, the less numerous they were.

Now the divine part [the brain] began to puncture this whole area of skin all around with its fire. Once the skin was pierced and the moisture had exuded outward through it, all that was purely wet and hot went away. The part that was compounded of the same stuff that the skin was made up of, caught up by this motion, was stretched to a great length outside this skin, no thicker than the punctured hole [through which it passed]. However, it moved slowly, and so the surrounding air pushed it back inside to curl underneath the skin and take root there. This is the process by which hair has come to grow on the skin. Hair is something fibrous, made of the same stuff as the skin, though harder and more dense due to the felting effect of the cooling process: once a hair separates off from skin, it is cooled and so gets felted together.

With this stuff, then, our maker made our heads bushy, availing himself of the causal factors just described. His intention was that this, not bare flesh, ought to provide a protective covering for the part of the head that holds the brain: it was light, and just right for providing shade in summer, and shelter in winter, without obstructing or interfering with the head's sensitivity in any way.

Sinew, skin and bone were interwoven at the ends of our fingers and toes. The mixture of these three was dried out, resulting in the formation of a single stuff, a piece of hard skin, the same in every case. Now these were merely auxiliary causes in its formation—the preeminent cause of its production was the purpose that took account of future generations: our creators understood that one day women and the whole realm of wild beasts would one day come to be from men, and in particular they knew that many of these offspring would need the use of nails and claws or hoofs for many purposes. This is why they took care to include nails formed in a rudimentary way in their design for humankind, right at the start. This was their reason, then, and these the professed aims that guided them in making skin, hair and nails grow at the extremities of our limbs.

So all the parts, all the limbs of the mortal living thing came to constitute a natural whole. Of necessity, however, it came about that he lived his life surrounded by fire and air, which caused him to waste away and be depleted, and so to perish. The gods, therefore, devised something to protect him. They made another mixture and caused another nature to grow, one congenial to our human nature though endowed with other features and other sensations, so as to be a different living thing. These are now cultivated trees, plants and seeds, taught by the art of agriculture to be domesticated for our use. But at first the only kinds there were, were wild ones, older than our cultivated kinds. We may call these plants "living things" on the ground that anything that partakes of life has an incontestable right to be called a "living thing." And in fact, what we are talking about now partakes of the third type of soul, the type that our account has situated between the midriff and the navel. This type is totally devoid of opinion, reasoning or understanding, though it does share in sensation, pleasant and painful, and desires. For throughout its existence it is completely passive, and its formation has not entrusted it with a natural ability to discern and reflect upon any of its own characteristics, by revolving within and about itself, repelling movement from without and exercising its own inherent movement. Hence it is alive, to be sure, and unmistakably a living thing, but it stays put, standing fixed and rooted, since it lacks self-motion.

All these varieties were planted by our masters, to whom we are subject, to nourish us. Having done that, they proceeded to cut channels throughout our bodies, like water pipes in a garden, so that our bodies could be irrigated, as it were, by an oncoming stream. First, they cut two blood veins, channels hidden underneath the skin where the flesh joins it, to go down either side of the back—the body is a twofold thing, with a right and a left side. They situated these veins alongside the spine, and between them they placed the life-giving marrow as well, to give it its best chance to flourish, and to allow the bloodstream, which courses downhill, to flow readily from this region and uniformly irrigate the other parts of the body. They next split these veins in the region of the head, and wove them through one another, crossing them in opposite directions. They diverted the veins from the right toward the left side of the body, and those from the left toward the right, so that they, together with the skin, would act as a bond to keep the head fastened to the body, seeing that there were no sinews attached to the crown to enclose the head all around. They did this especially to make sure that the stimulations received by the senses, coming from either side of the body, might register clearly upon the body as a whole.

From here the gods proceeded to fashion the irrigation system in the following way. We'll come to see it more easily if we can first agree on this point: whatever is made up of smaller parts holds in larger parts, while what consists of larger parts is incapable of holding in smaller parts. Of all the elemental kinds, fire is made up of the smallest parts, and that is the reason it can pass through water, earth and air, and any of their compounds. Nothing can hold it in. Now we must apply the same point to our belly. When food and drink descend into it, it holds them in, but it cannot hold in air and fire, consisting as they do of smaller parts than it does. And so the god availed himself of fire and air to conduct moisture from the belly to the [two] veins. He wove together an interlaced structure of air and fire, something like a fish trap. At its entrance it had a pair of funnels, one of which in turn he subdivided into two. And from the funnels he stretched reeds, as it were, all around throughout the structure, right to its extremities. All the interior parts of this network he made of fire; the funnels and the shell he made of air.

He took this structure and set it around the living thing which he had fashioned, in the following way. The funnel part he inserted into the mouth, and, consisting as it did of two funnels, he let one of them descend into the lungs down the windpipe, and the other alongside the windpipe into the belly. He made a split in the first one and assigned each of its parts a common outlet by way of the nostrils, so that when the one part fails to provide passage by way of the mouth, all of its currents also might be replenished from that one. The shell, the other part of the trap, he made to grow around the hollow part of the body, and he made this whole thing now flow together onto the funnels [compressing them]—gently, because they are made of air—now, when the funnels flow back [expanding again], he made the interlaced structure sink into and through the body—a relatively porous thing—and pass outside again. The interior rays of fire [inside the shell], bound from side to side, he made to follow the air as it passed in both directions. This process was to go on non-stop for as long as the mortal living thing holds together; and this, of course, is the phenomenon to which the name-giver (so we claim) assigned the names of inhalation and exhalation. This entire pattern of action and reaction, irrigating and cooling our bodies, supports their nutrition and life. For whenever the internal fire, united with the breath that passes in or out, follows it along, it surges up and down continually and makes its way through and into the belly, where it gets hold of the food and drink. These it dissolves or breaks up into tiny parts, which it then takes through the outbound passages along which it is advancing, and transfers them into the [two] veins, as water from a spring is transferred into water pipes. And so it causes the currents of the veins to flow through the body as through a conduit.

Let us, however, take another look at what happens in respiration. What explains its having the character that it now actually has? It is this. Since there is no void into which anything that is moving could enter, and since the air we breathe out does move out, away from us, it clearly follows that this air doesn’t move into a void, but pushes the air next to it out of its place. As this air is pushed out, it drives out the air next to it, and so on, and so inevitably the air, displaced all around, enters the place from which the original air was breathed out and refills that place, following hard on the breath. This all takes place at once, like the rotation of a wheel, because there is no such thing as a void. Consequently even as the breath is being discharged, the area of the chest and the lungs fills up again with the air that surrounds the body, air that goes through the cycle of displacement and penetrates the porous flesh. And again, when the air is turned back and passes outward through the body, it comes round to push respiration inward by way of the mouth and the nostrils.

How did these processes get started? The explanation, we must suppose, is this: in the case of every living thing, its inner parts that are close to the blood and the veins are its hottest parts—an inner spring of fire inside it, as it were. This, of course, is what we've been comparing to the interlaced structure of a fish trap; it is entirely woven of fire, we said, and extended throughout its middle, while the rest of it, the external parts, are woven of air. Now it is beyond dispute that what is hot has a natural tendency to move outward into its own proper region, toward that which is akin to it. In this case there are two passages out, one out through [the pores of] the body, and the other out through the mouth and nose. So whenever hot air rushes out the one passage, it pushes air around into the other, and the air so pushed around gets hot as it encounters the fire, while the air that passes out is cooled down. Now as the temperature changes and the air that enters by way of one or the other of the passages gets hotter, the hotter air is more inclined to return by way of the passage it entered, since it moves toward what is like itself, and so it pushes air around to and through the other passage. This air is affected the same way, and produces the same effect every time; and so, due to both these principles it produces an oscillation back and forth, thereby providing for inhalation and exhalation to occur.

In this connection we should pursue along these lines an inquiry into the causes of the phenomena associated with medical cupping, and of swallowing, as well as of the motion of all projectiles that are dispatched into the air and along the ground. We should also investigate all sounds, whether fast or slow—sounds that appear to us as high pitched or low. Sometimes, when the motion they produce in us as they move towards us lacks conformity, these sounds are inharmonious; at other times, when the motion does have conformity, the sounds are harmonious. [What happens in the latter case is this.] The slower sounds catch up with the motions of the earlier and quicker sounds as these are already dying away and have come to a point of conformity with the motions produced by the slower sounds that travel later. In catching up with them, the slower sounds do not upset them, even though they introduce another motion. On the contrary, they graft onto the quicker movement, now dying away, the beginning of a slower one that conforms to it, and so they produce a single effect, a mixture of high and low. Hence the pleasure they bring to fools and the delight they afford—by their expression of divine harmony in mortal movement—to the wise.

And what is more, every kind of water current, even the descent of a thunderbolt as well as that marvellous "attraction" exercised by amber and by the lodestone, in all these cases there is no such thing as a force of attraction. As any careful investigator will discover, there is no void; these things push themselves around into each other; all things move by exchanging places, each to its own place, whether in the process of combination or of dissolution. He will discover that these "works of wizardry" are due to the interactive relationships among these phenomena.

The phenomenon of respiration, which provided the occasion for this account, is a case in point. The above are the principles and causes to which it owes its existence, as we have said before. The fire cuts up the food [in our bellies] and as it follows the breath it oscillates inside us. As the oscillation goes on, the fire pumps the cut-up bits of food from the belly and packs them into the veins. This is the mechanism by which the streams of nourishment continue to flow throughout the bodies of all living things. The bits of food, freshly cut up and derived from things like themselves—from fruits or from vegetables which the god had caused to grow for this very purpose, to serve us as food—come to have a variety of colors as a result of being mixed together, but a reddish color pervading them predominates, a character that is the product of the cutting and staining action of fire upon moisture. This is why the color of the liquid that flows in our bodies looks the way we've described; this liquid we call blood, which feeds our flesh and indeed our whole bodies. From this source the various parts of our bodies are watered and so replenish the supports of the depleted areas. Now both processes, the replenishment and the depletion, follow the manner of the movement of anything within the universe at large: everything moves toward that which is of its own kind. In this case, our external environment continually wastes us away and distributes our bulk by dispatching each [elemental] kind toward its own sort. The ingredients in our blood, then, having been chopped up inside us and encompassed by the individual living thing as by the frame of the universe, of necessity imitate the universe's motion. And so, as each of the fragmented parts inside moves toward its own kind, it replenishes once again the area just then depleted. In every case, whenever there is more leaving a body than flowing in [to replenish it], it diminishes; whenever less, the body grows. So while a living thing's constitution is still young, and its elemental triangles are "fresh from the slips," as it were, the triangles are firmly locked together, even though the frame of its entire mass is pliable, seeing that it has just lately been formed from marrow and nourished with milk. Now when the triangles that constitute the young living thing's food and drink enter its body from the outside and are enveloped within it, the body's own new triangles cut and prevail over these others, which are older and weaker than they are. The living thing is thus nourished by an abundance of like parts, and so made to grow big. But when the roots of the triangles are slackened as a result of numerous conflicts they have waged against numerous adversaries over a long period of time, they are no longer able to cut up the entering food-triangles into conformity with themselves. They are themselves handily destroyed by the invaders from outside. Every living thing, then, goes into decline when it loses this battle, and it suffers what we call "old age." Eventually the interlocking bonds of the triangles around the marrow can no longer hold on, and come apart under stress, and when this happens they let the bonds of the soul go. The soul is then released in a natural way, and finds it pleasant to take its flight. All that is unnatural, we recall, is painful while all that occurs naturally is pleasant. This is true of death as well: a death that is due to disease or injury is painful and forced, while a death that comes naturally, when the aging process has run its course, is of all deaths the least distressing—a pleasant, not a painful death.

How diseases originate is, I take it, obvious to all. Given that there are four kinds of stuff out of which the body has been constructed—earth, fire, water and air—it may happen that some of these unnaturally increase themselves at the expense of the others. Or they may switch regions, each leaving its own and moving into another's region. Or again, since there is in fact more than one variety of fire and the other stuffs, it may happen that a given bodily part accommodates a particular variety that is not appropriate for it. When these things happen, they bring on conflicts and diseases. For when any of these unnatural occurrences and changes take place, bodily parts that used to be cold become hot, or those that are dry go on to become moist, and so with light and heavy, too. They undergo all sorts of changes in all sorts of ways. Indeed, it is our view that only when that which arrives at or leaves a particular bodily part is the same as that part, consistent, uniform and in proper proportion with it, will the body be allowed to remain stable, sound and healthy. On the other hand, anything that causes offense by passing beyond these bounds as it arrives or departs will bring on a multiplicity of altered states, and an infinity of diseases and degenerations.

Furthermore, since there is a class of secondary structures to be found in nature, anyone who intends to understand diseases will have a second set of subjects to study. Since marrow and bone, flesh and sinew are composed of the elemental stuffs—from which blood also has been formed, though in a different way—most of the diseases are brought on in the manner just described. But the most serious and grievous diseases are contracted when the process of generation that led to the formation of these structures is reversed. When this happens, they degenerate. It is natural for flesh and sinews to be formed from blood, the sinew from the fiber (which is of its own kind) and the flesh from the part of the blood that congeals when the sinew is separated from it. And the sticky and oily stuff that in its turn emerges from the sinew and the flesh both glues the flesh to the bone and feeds the marrow-encompassing bone itself, so causing it to grow. And because the bone is so dense, the part of this stuff that filters through, consisting as it does of the purest, smoothest and oiliest kind of triangles, forms droplets inside the bone and waters the marrow. And when this is the way it actually happens in each case, health will generally result.

Disease, however, will result if things happen the other way around. For when flesh that is wasting away passes its waste back into the veins, the veins will contain not only air but also an excess of blood of great variety. This blood will have a multitude of colors and bitter aspects, and even acidic and salty qualities, and will contain bile and serum and phlegm of every sort. These are all back-products and agents of destruction. To begin with, they corrupt the blood itself, and then also they do not supply the body any further with nourishment. They move everywhere throughout the veins, no longer keeping to the order of natural circulation. They are hostile to one another, since none receives any advantage from any other, and they wage a destructive and devastating war against the constituents of the body that have stayed intact and kept to their posts.

Now as the oldest part of the flesh wastes away, it resists assimilation. It turns black as a result of being subjected to a prolonged process of burning, and because it is thoroughly eaten up it is bitter, and so it launches a severe attack against any part of the body that has not yet been destroyed. Sometimes the bitterness is largely refined away, and then the black color acquires an acidic quality that replaces the bitter. At other times, though, the bitterness is steeped in blood, and then it comes to have more of a reddish color, and when the black is mixed with this, it becomes a grass-like green. Further, when the flesh that is disintegrated by the fire of the inflammation is fairly young, the color that is mixed with the bitterness is a yellowish orange. Now the name “bile,” common to all these varieties, was given to them either by doctors, possibly, or else by someone who had the ability to look at a plurality of unlike things and see in them a single kind that deserves to be called by a single name. As for everything that can be called a variety of bile, each has its own distinctive definition, depending on its color. In the case of serum, some of it, the watery part of the blood, is benign while that which is a part of the black, acid bile is malignant when heat causes it to be mixed with a salty quality. This kind of thing is called acid phlegm.

Furthermore, when the stuff that comes from the disintegration of young, tender flesh is exposed to air and blown up with wind and enveloped in moisture, bubbles form as a result, each one too small to be seen though collectively amounting to a visible mass. These bubbles look white, as foam begins to form. All this disintegration of tender flesh reacting with air is what we call white phlegm. Newly formed phlegm, furthermore, has a watery part which consists of perspiration and tears, as well as any other impurities that are discharged every day. So whenever the blood, instead of being replenished in the natural way by nutrients from food and drink, derives its volume from opposite sources, contrary to nature's way, all these things, it turns out, serve as instruments of disease.

Now when a certain part of the flesh is decomposed by disease, as long as the foundations of the flesh remain intact, the effect of the calamity is only half of what it would otherwise be, for there is still a chance of an easy recovery. But when the stuff that binds the flesh to the bones becomes diseased and no longer nourishes the bone or binds the flesh to the bone because it is now separated from flesh and bone as well as from sinews, it turns from being slick and smooth and oily to being rough and briny, shriveled up in consequence of its bad regimen. When this occurs, all the stuff that this happens to crumbles away back into the flesh and the sinew, and separates from the bone. The flesh, which collapses with it away from its roots, leaves the sinews bare and full of brine. And the flesh itself succumbs back into the bloodstream, where it works to aggravate the previously mentioned diseases.

Severe as these bodily processes are, those disorders that affect the more basic tissues are even more serious. When the density of the flesh prevents the bone from getting enough ventilation, the bone gets moldy, which causes it to get too hot. Gangrene sets in and the bone cannot take in its nourishment. It then crumbles and, by a reverse process, is dissolved into that nourishment which, in its turn, enters the flesh, and as the flesh lands in the blood it causes all of the previously mentioned diseases to become more virulent still. But the most extreme case of all is when the marrow becomes diseased, either as a result of some deficiency or some excess. This produces the most serious, the most critically fatal diseases, in which all the bodily processes are made to flow backwards.

Further, there is a third class of diseases, which we should think of as arising in three ways, (a) One way is from air, (b) another from phlegm and (c) the third from bile, (a) When the lungs, the dispensers of air to the body, are obstructed by humors, they do not permit a clear passage. At some places the air cannot get in, while at others more than the appropriate amount gets in. In the former case, there will be parts of the body that don't get any breath and so begin to decay, while in the latter case the air forces its way through the veins and twists them together like strands. It makes its way into the central region of the body, the region that contains the midriff, where it is shut in, thereby causing the body to waste away. These factors produce countless painful diseases, often accompanied by profuse perspiration. And often, when flesh disintegrates inside the body, air is produced there, but is unable to get out. This air then causes just as much excruciating pain as the air that comes in from outside. The pain is most severe when the air settles around the sinews and the veins there and causes them to swell, thereby stretching backwards the "back stays" (the great sinews of the shoulder and arm) and the sinews attached to them. It is from this phenomenon of stretching, of course, that the diseases called tetanus ("tension") and opisthotonus ("backward stretching") have received their names. These diseases are difficult to cure. In fact, the onset of a fever affords the best prospects for relief from such ailments.

(b) Now as for the white phlegm, as long as it is trapped in the body, it is troublesome because of the air in its bubbles. But if it finds a vent to the outside of the body, it is gentler, even though it does deck the body with white, leprous spots and engenders the corresponding diseases. If it is mixed with black bile and the mixture is sprayed against the divine circuits in the head, thereby throwing them into confusion, the effect is fairly mild if it comes during sleep, but should it come upon someone while awake, it is much harder to shake off. Seeing that it is a disease of the sacred part of our constitution, it is entirely just that it should be called the "sacred" disease (i.e., epilepsy).

Acid and salty phlegm is the source of all those diseases that come about by passage of fluids. These disorders have been given all sorts of different names, in view of the fact that the bodily regions into which the fluids flow are quite diverse.

(c) All inflammations in the body (so called from their being burned or "set aflame") are caused by bile. When bile finds a vent to the outside, it boils over and sends up all sorts of tumors, but when it is shut up inside, it creates many inflammatory diseases. The worst occurs when the bile gets mixed with clean blood and disrupts the disposition of the blood's fibers, which are interspersed throughout the blood. These fibers act to preserve a balance of thinness and thickness, i.e., to prevent both the blood from getting so liquid, due to the body's heat, that it oozes out from the body's pores, and, on the other hand, its getting so dense that it is sluggish and hardly able to circulate within the veins. The fibers, then, by virtue of their natural composition, preserve the appropriate state between these conditions. And even after death, when the blood cools down, if the fibers are [extracted from the blood and] collected, the residue will still be completely runny, while if they are left in the blood, they, along with the surrounding cold, congeal it in no time. Given, then, that the fibers have this effect upon the blood, though the bile—which originated as primitive blood and then from flesh was dissolved into blood again—is hot and liquid at first as a little of it invades the blood, it congeals under the effect of the fibers, and as it congeals and is forced to extinguish its heat it causes internal cold and shivering. But as more of it flows in, it overpowers the fibers with its own heat. It boils over and shakes them up into utter confusion. And if it proves capable of sustaining its power to the end, it penetrates to the marrow and burns it up, thereby loosening the cables that hold the soul there, like a ship, and setting the soul free. But when there is rather little of it and the body resists its dissolution, the bile is itself overpowered and is expelled either by way of the body as a whole or else it is compressed through the veins into the lower or upper belly, and is expelled from the body like an exile from a city in civil strife, so bringing on diarrhea, dysentery and every disease of that kind. Bodies afflicted mostly by an excess of fire will generate continuous states of heat and fevers; those suffering from an excess of air produce fevers that recur every day; while those that have an excess of water have fevers that recur only every other day, given that water is more sluggish than air or fire. Bodies afflicted by an excess of earth, the most sluggish of the four, are purged within a fourfold cycle of time and produce fevers that occur every fourth day, fevers that are hard to get over.

The foregoing described how diseases of the body happen to come about. The diseases of the soul that result from a bodily condition come about in the following way. It must be granted, surely, that mindlessness is the disease of the soul, and of mindlessness there are two kinds. One is madness, and the other is ignorance. And so if a man suffers from a condition that brings on either one or the other, that condition must be declared a disease.

We must lay it down that the diseases that pose the gravest dangers for the soul are excessive pleasures and pains. When a man enjoys himself too much or, in the opposite case, when he suffers great pain, and he exerts himself to seize the one and avoid the other in inopportune ways, he lacks the ability to see or hear anything right. He goes raving mad and is at that moment least capable of rational thought. And if the seed of a man's marrow grows to overflowing abundance like a tree that bears an inordinately plentiful quantity of fruit, he is in for a long series of bursts of pain, or of pleasures, in the area of his desires and their fruition. These severe pleasures and pains drive him mad for the greater part of his life, and though his body has made his soul diseased and witless, people will think of him not as sick, but as willfully evil. But the truth about sexual overindulgence is that it is a disease of the soul caused primarily by the condition of a single stuff which, due to the porousness of the bones, flows within the body and renders it moist. And indeed, just about every type of succumbing to pleasure is talked about as something reproachable, as though the evils are willfully done. But it is not right to reproach people for them, for no one is willfully evil. A man becomes evil, rather, as a result of one or another corrupt condition of his body and an uneducated upbringing. No one who incurs these pernicious conditions would will to have them.

And as for pains, once again it is the body that causes the soul so much trouble, and in the same ways. When any of a man's acid and briny phlegms or any bitter and bilious humors wander up and down his body without finding a vent to the outside and remain pent up inside, they mix the vapor that they give off with the motion of the soul and so are confounded with it. So they produce all sorts of diseases of the soul, some more intense and some more frequent than others. And as they move to the three regions of the soul, each of them produces a multitude of varieties of bad temper and melancholy in the region it attacks, as well as of recklessness and cowardice, not to mention forgetfulness and stupidity. Furthermore, when men whose constitutions are bad in this way have bad forms of government where bad civic speeches are given, both in public and in private and where, besides, no studies that could remedy this situation are at all pursued by people from their youth on up, that is how all of us who are bad come to be that way—the products of two causes both entirely beyond our control. It is the begetters far more than the begotten, and the nurturers far more than the nurtured, that bear the blame for all this. Even so, one should make every possible effort to flee from badness, whether with the help of one's upbringing, or the pursuits or studies one undertakes, and to seize its opposite. But that is the subject for another speech.

The counterpart to the subject just dealt with, i.e., how to treat our bodies and states of mind and preserve them whole, is one that it is now fitting and right to give its turn. After all, good things have more of a claim to be the subject of our speech than bad things. Now all that is good is beautiful, and what is beautiful is not ill-proportioned. Hence we must take it that if a living thing is to be in good condition, it will be well-proportioned. We can perceive the less important proportions and do some figuring about them, but the more important proportions, which are of the greatest consequence, we are unable to figure out. In determining health and disease or virtue and vice no proportion or lack of it is more important than that between soul and body—yet we do not think about any of them nor do we realize that when a vigorous and excellent soul is carried about by a too frail and puny frame, or when the two are combined in the opposite way, the living thing as a whole lacks beauty, because it is lacking in the most important of proportions. That living thing, however, which finds itself in the opposite condition is, for those who are able to observe it, the most beautiful, the most desirable of all things to behold. Imagine a body which lacks proportion because its legs are too long or something else is too big. It is not only ugly but also causes itself no end of troubles. As its parts try to cooperate to get its tasks done it frequently tires itself out or gets convulsive, or, because it lurches this way and that, it keeps falling down. That's how we ought to think of that combination of soul and body which we call the living thing. When within it there is a soul more powerful than the body and this soul gets excited, it churns the whole being and fills it from inside with diseases, and when it concentrates on one or another course of study or inquiry, it wears the body out. And again, when the soul engages in public or private teaching sessions or verbal battles, the disputes and contentions that then occur cause the soul to fire the body up and rock it back and forth, so inducing discharges which trick most so-called doctors into making misguided diagnoses. But when, on the other hand, a large body, too much for its soul, is joined with a puny and feeble mind, then, given that human beings have two sets of natural desires—desires of the body for food and desires of the most divine part of us for wisdom—the motions of the stronger part will predominate, and amplify their own interest. They render the functions of the soul dull, stupid and forgetful, thereby bringing on the gravest disease of all: ignorance.

From both of these conditions there is in fact one way to preserve oneself, and that is not to exercise the soul without exercising the body, nor the body without the soul, so that each may be balanced by the other and so be sound. The mathematician, then, or the ardent devotee of any other intellectual discipline should also provide exercise for his body by taking part in gymnastics, while one who takes care to develop his body should in his turn practice the exercises of the soul by applying himself to the arts and to every pursuit of wisdom, if he is to truly deserve the joint epithets of “fine and good.” And the various bodily parts should also be looked after in this same way, in imitation of the structure of the universe. For since the body is heated and cooled inside by things that enter it and is dried and moistened by things outside of it and made to undergo the consequent changes by both of these motions, it will happen that when a man subjects his body to these motions when it has been in a state of rest, the body is overcome and brought to ruin. But if he models himself after what we have called the foster-mother and nurse of the universe and persistently refuses to allow his body any degree of rest but exercises and continually agitates it through its whole extent, he will keep in a state of natural equilibrium the internal and the external motions. And if the agitation is a measured one, he will succeed in bringing order and regularity to those disturbances and those elemental parts that wander all over the body according to their affinities in the way described in the account we gave earlier about the universe. He will not allow one hostile element to position itself next to another and so breed wars and diseases in the body.

Instead, he will have one friendly element placed by another, and so bring about health.

Now the best of the motions is one that occurs within oneself and is caused by oneself. This is the motion that bears the greatest kinship to understanding and to the motion of the universe. Motion that is caused by the agency of something else is less good. Worst of all is the motion that moves, part by part, a passive body in a state of rest, and does so by means of other things. That, then, is why the motion induced by physical exercise is the best of those that purify and restore the body. Second is that induced by the rocking motion of sea travel or travel in any other kind of conveyance that doesn't tire one out. The third type of motion is useful in an occasional instance of dire need; barring that, however, no man in his right mind should tolerate it. This is medical purging by means of drugs. We should avoid aggravating with drugs diseases that aren't particularly dangerous. Every disease has a certain makeup that in a way resembles the natural makeup of living things. In fact, the constitution of such beings goes through an ordered series of stages throughout their life. This is true of the species as a whole, and also of its individual members, each of which is born with its allotted span of life, barring unavoidable accidents. This is because its triangles are so made up, right from the beginning, as to have the capacity to hold up for a limited time beyond which life cannot be prolonged any further. Now diseases have a similar makeup, so that when you try to wipe them out with drugs before they have run their due course, the mild diseases are liable to get severe, and the occasional ones frequent. That is why you need to cater to all such diseases by taking care of yourself to the extent you are free and have the time to do that. What you should not do is aggravate a stubborn irritation with drugs.

Let these remarks suffice, then, on the subject of the living thing as a whole and its bodily parts, and how a man should both lead and be led by himself in order to have the best prospects for leading a rational life. Indeed, we must give an even higher priority to doing our utmost to make sure that the part that is to do the leading is as superbly and perfectly as possible fitted for that task. Now a thoroughgoing discussion of these matters would in and of itself be a considerable task, but if we treat it as a side issue, in line with what we have said before, it may not be out of turn to conclude our discourse with the following observations.

There are, as we have said many times now, three distinct types of soul that reside within us, each with its own motions. So now too, we must say in the same vein, as briefly as we can, that any type which is idle and keeps its motions inactive cannot but become very weak, while one that keeps exercising becomes very strong. And so we must keep watch to make sure that their motions remain proportionate to each other.

Now we ought to think of the most sovereign part of our soul as god's gift to us, given to be our guiding spirit. This, of course, is the type of soul that, as we maintain, resides in the top part of our bodies. It raises us up away from the earth and toward what is akin to us in heaven, as though we are plants grown not from the earth but from heaven. In saying this, we speak absolutely correctly. For it is from heaven, the place from which our souls were originally born, that the divine part suspends our head, i.e., our root, and so keeps our whole body erect. So if a man has become absorbed in his appetites or his ambitions and takes great pains to further them, all his thoughts are bound to become merely mortal. And so far as it is at all possible for a man to become thoroughly mortal, he cannot help but fully succeed in this, seeing that he has cultivated his mortality all along. On the other hand, if a man has seriously devoted himself to the love of learning and to true wisdom, if he has exercised these aspects of himself above all, then there is absolutely no way that his thoughts can fail to be immortal and divine, should truth come within his grasp. And to the extent that human nature can partake of immortality, he can in no way fail to achieve this: constantly caring for his divine part as he does, keeping well-ordered the guiding spirit that lives within him, he must indeed be supremely happy. Now there is but one way to care for anything, and that is to provide for it the nourishment and the motions that are proper to it. And the motions that have an affinity to the divine part within us are the thoughts and revolutions of the universe. These, surely, are the ones which each of us should follow. We should redirect the revolutions in our heads that were thrown off course at our birth, by coming to learn the harmonies and revolutions of the universe, and so bring into conformity with its objects our faculty of understanding, as it was in its original condition. And when this conformity is complete, we shall have achieved our goal: that most excellent life offered to humankind by the gods, both now and forevermore.

And now indeed, it seems, we have all but completed our initial assignment, that of tracing the history of the universe down to the emergence of humankind. We should go on to mention briefly how the other living things came to be—a topic that won't require many words. By doing this we'll seem to be in better measure with ourselves so far as our words on these subjects are concerned.

Let us proceed, then, to a discussion of this subject in the following way. According to our likely account, all male-born humans who lived lives of cowardice or injustice were reborn in the second generation as women. And this explains why at that time the gods fashioned the desire for sexual union, by constructing one ensouled living thing in us as well as another one in women. This is how they made them in each case: There is [in a man] a passage by which fluids exit from the body, where it receives the liquid that has passed through the lungs down into the kidneys and on into the bladder and expels it under pressure of air. From this passage they bored a connecting one into the compacted marrow that runs from the head along the neck through the spine. This is in fact the marrow that we have previously called “seed.” Now because it has soul in it and had now found a vent [to the outside], this marrow instilled a life-giving desire for emission right at the place of venting, and so produced the love of procreation. This is why, of course, the male genitals are unruly and self-willed, like an animal that will not be subject to reason and, driven crazy by its desires, seeks to overpower everything else. The very same causes operate in women. A woman’s womb or uterus, as it is called, is a living thing within her with a desire for childbearing. Now when this remains unfruitful for an unseasonably long period of time, it is extremely frustrated and travels everywhere up and down her body. It blocks up her respiratory passages, and by not allowing her to breathe it throws her into extreme emergencies, and visits all sorts of other illnesses upon her until finally the woman’s desire and the man’s love bring them together, and, like plucking the fruit from a tree, they sow the seed into the ploughed field of her womb, living things too small to be visible and still without form. And when they have again given them distinct form, they nourish these living things so that they can mature inside the womb. Afterwards, they bring them to birth, introducing them into the light of day.

That is how women and females in general came to be. As for birds, as a kind they are the products of a transformation. They grow feathers instead of hair. They descended from innocent but simpleminded men, men who studied the heavenly bodies but in their naivete believed that the most reliable proofs concerning them could be based upon visual observation. Land animals in the wild, moreover, came from men who had no tincture of philosophy and who made no study of the universe whatsoever, because they no longer made use of the revolutions in their heads but instead followed the lead of the parts of the soul that reside in the chest. As a consequence of these ways of theirs they carried their forelimbs and their heads dragging towards the ground, like towards like. The tops of their heads became elongated and took all sorts of shapes, depending on the particular way the revolutions were squeezed together from lack of use. This is the reason animals of this kind have four or more feet. The god placed a greater number of supports under the more mindless beings, so that they might be drawn more closely to the ground. As for the most mindless of these animals, the ones whose entire bodies stretch out completely along the ground, the gods made them without feet, crawling along the ground, there being no need of feet anymore. The fourth kind of animal, the kind that lives in water, came from those men who were without question the most stupid and ignorant of all. The gods who brought about their transformation concluded that these no longer deserved to breathe pure air, because their souls were tainted with transgressions of every sort. Instead of letting them breathe rare and pure air, they shoved them into water to breathe its murky depths. This is the origin of fish, of all shellfish, and of every water-inhabiting animal. Their justly due reward for their extreme stupidity is their extreme dwelling place. These, then, are the conditions that govern, both then and now, how all the animals exchange their forms, one for the other, and in the process lose or gain intelligence or folly.

And so now we may say that our account of the universe has reached its conclusion. This world of ours has received and teems with living things, mortal and immortal. A visible living thing containing visible ones, perceptible god, image of the intelligible Living Thing, its grandness, goodness, beauty and perfection are unexcelled. Our one universe, indeed the only one of its kind, has come to be.

# On Virtue.

Translated by George Burges, M. A.

PERSONS OF THE DIALOGUE.

Socrates and a Friend.

Socrates:: Is Virtue a thing to be taught, or to be not taught? but do men become good by nature, or by any other means?

Friend:: I cannot, Socrates, state at present.

Socrates:: But let us consider the matter in this way. Come then, say, if a person wished to become good in the virtue, in which clever cooks are good, from whence would he become so?

Friend:: It is evident, if he learnt from good cooks.

Socrates:: Well then, if a person wished to become a good physician, by going to whom would he become a good physician?

Friend:: It is evident, by going to some one of the good physicians.

Socrates:: But if he wished to become good in the art, in which clever carpenters are good?

Friend:: To some one of the good carpenters.

Socrates:: If then he wished to be good in the virtue, in which men are good and clever, whither must he go and learn?

Friend:: I conceive to some one of the good men to learn this, if it is to be learnt; for from whence else?

Socrates:: Come then, say, who are the men that have become good? in order that we may see whether these are the persons, who make men good.

Friend:: Thucydides, and Themistocles, and Aristides, and Pericles.

Socrates:: Have we it in our power to say who was the teacher of each of these?

Friend:: We have not; for it is not told.

Socrates:: Well then, can we mention any pupil, either amongst strangers or citizens or any one else, either a free man or a slave, who assigns as the cause of his having become wise and good his intercourse with them?

Friend:: This too is not told.

Socrates:: But they did not surely grudge to share their virtue with other persons.

Friend:: Perhaps so.

Socrates:: Was it that there might not be rival artists, just as cooks, and physicians, and carpenters feel a jealousy; since it is not to their advantage for many rival artists to exist, nor for them to dwell amongst many similar persons. Is it then in like manner not an advantage for good men to dwell amongst many similar persons?

Friend:: Perhaps so.

Socrates:: Are not the good and the just the same?

Friend:: Yes, they are.

Socrates:: Is there the individual, to whom it is an advantage to live not amongst good persons, but amongst bad?

Friend:: I cannot tell.

Socrates:: Can you not tell this too, whether it is the work of good men to do a hurt, and of bad men to do a benefit, or the reverse?

Friend:: The reverse.

Socrates:: The good then do a benefit, the bad do a hurt.

Friend:: Yes.

Socrates:: Is there a person who wishes to be hurt rather than to be benefited?

Friend:: By no means.

Socrates:: No one therefore wishes to live amongst bad persons, rather than amongst good.

Friend:: It is so.

Socrates:: Not one then of the good is so jealous of another, as not to make him a good person and similar to himself.

Friend:: From this reasoning it seems so.

Socrates:: You have heard that Cleophantus was the son of Themistocles.

Friend:: I have heard it.

Socrates:: It is evident then that Themistocles was not jealous of his son becoming the best possible; who was jealous of no one else, if indeed he was a good man; and good they say he was.

Friend:: Yes.

Socrates:: You know then that Themistocles caused his son to be taught to be a clever and a good horseman. For instance he used to remain standing upright upon horses, and upright too hurled a javelin from the backs of the horses, and did many other wonderful feats, and taught him, and made him wise in many other things, such as are closely connected with a good education. Or have you not heard so from elderly persons?

Friend:: I have heard it.

Socrates:: No one then could find fault with the son's nature as being bad.

Friend:: Not justly so at least from what you have said.

Socrates:: But what is this? that Cleophantus, the son of Themistocles, became a good and wise man in the matters where his father was wise, have you ever heard from any younger or older person?

Friend:: I have not heard it.

Socrates:: Do we then conceive that he wished to instruct his own son in these matters; but in the wisdom, in which he was wise himself, not to make him better than any of his neighbours, if virtue were a thing to be taught?

Friend:: It is not likely at least.

Socrates:: Of such a kind then is this your teacher of virtue, to whom you have alluded? Let us then look to another, by name Aristides, who brought up Lysimachus, and instructed him the best of the Athenians on such subjects as are connected with good teachers; and yet he made him a man no better than any body; for both you and I have seen and associated with him.

Friend:: It is true.

Socrates:: You know too that Pericles brought up well his sons Paralus and Xanthippus, of the latter of whom you seem to me to have been the lover. These, as you know yourself, he taught to be horsemen inferior to none of the Athenians; and he instructed them to be inferior to no one in the rest of contests, and all the other things that are learnt by art. But did he not wish to make them good men?

Friend:: But perhaps, Socrates, they would have become so, had they not died young.

Socrates:: You reasonably come to the aid of your beloved. But Pericles would have much rather made them clever in his own wisdom, than in music and contests, had virtue been a thing to be taught, and had he been able to make them good men. But I fear that it is a thing not to be taught; since Thucydides brought up well his two sons, Melesias and Stephanus, in behalf of whom you will not have it in your power to say, what you have done in behalf of the sons of Pericles; for one of these you surely know lived to old age, and the other much beyond. And yet their father taught them well other pursuits, and they wrestled the best of the Athenians. For he put one under Xanthias, and the other under Eudorus; and these were surely thought to wrestle the best of those of that period.

Friend:: Yes, they were.

Is it not evident then, that he would not have taught his sons these things, where it was requisite to instruct them at an expense to himself, but those where without expending any thing it was requisite to make them good men. Now would he not have taught them this, if it were to be taught?

Friend:: It is likely at least.

Socrates:: But perhaps Thucydides was a man of small means, and had not very many friends amongst the Athenians or their allies; and he was of a great family, and of great power in the state, and amongst the rest of the Greeks, so that if this had been a thing to be taught, he would have discovered a person amongst those of the country, or foreigners, who would have made his son a good man, if he himself had, through his attention to state affairs, no leisure. But I fear that virtue is a thing not to be taught.

Friend:: Perhaps not.

Socrates:: But if it is not to be taught, are the good naturally so from their birth? But this perhaps we shall discover by considering the matter in this way. Come then, say, do there exist the natures of good horses?

Friend:: They do exist.

Socrates:: Are there not men, who possess an art, by which they know the natures of good horses, both as regards their body, with reference to running, and their feelings, which of them are full of spirit or devoid of it.

Friend:: Yes.

Socrates:: What is this art, and what its name?

Friend:: Equestrian.

Socrates:: Is there not in like manner an art relating to dogs, by which persons discriminate between the good and bad natures of dogs?

Friend:: There is.

Socrates:: What is it?

Friend:: The hunter's art.

Socrates:: There are too assayers amongst us of gold and silver, who, by looking, decide upon both the better and the worse metal.

Friend:: There are.

Socrates:: And what do you call them?

Friend:: Silver assayers.

Socrates:: The boy-drillers moreover know, by examining the natures of the bodies of men, which of them are useful and which not, for each of their labours, and which of the bodies of persons older and young, are about to be worthy of note, and in which there is much hope of their executing works connected with the body.

Friend:: It is so.

Socrates:: Whether then are good horses and dogs, and other things of such a kind, of more importance in states, or good men?

Friend:: Good men.

Socrates:: Well then, do you conceive that, if the natures of men were good for virtue, that mankind would not have planned in every way to discover those natures?

Friend:: It is likely at least.

Socrates:: Can you then mention any art, which has been exhibited and applied to the natures of good men, so as to enable persons to decide upon them?

Friend:: I cannot.

Socrates:: And yet the art would be worth much, and so too the parties possessing it. For they would have pointed out the young men, who, when they were still boys, were about to be good; and whom we should have taken and kept in the Acropolis for the public use, as if it were silver, and something more beautiful, in order that they might not suffer any mischief, either in a fight or in any other danger, but be laid up as the saviours and benefactors of the state, since they should have arrived at a proper age. But it seems almost that virtue does not exist to mankind either by nature or instruction.

Friend:: How then, Socrates, would persons seem to become good, if they do not become so by nature or instruction? By what other means could the good exist?

Socrates:: This, I think, could not be shown easily; but I conjecture that the property of goodness is something especially divine, and that good men exist, as prophets do and oracle chaunters. For these exist neither by nature nor by art, but become such by the inspiration of the gods. And so too good men point out to states what is about on each occasion to happen, and what is about to be, from the inspiration of a god, much more, and more clearly, than oracle chaunters do: and even women somehow say that such a person is a divine man; and the Lacedæmonians too, when they praise in a very handsome manner, say that a man is divine, and often does Homer make use of the same expression, and the rest of poets likewise. When therefore a god wishes a state to do well, he causes some men in it to be good; but when a state is about to do ill, the god takes away the good men from it. Thus then it is likely that virtue is a thing not to be taught nor derived from nature, but exists by a divine allotment to those who possess it.

## On Virtue

Translated by Mark Reuter.

Socrates, Friend

Socrates:: Can virtue be taught? If not, do men become good by nature, or in some other way?

Friend:: I can’t give you an answer right now, Socrates.

Socrates:: Well now, let’s consider it. Tell me, if someone wanted to become good with the virtue that makes expert chefs good, how would he do it?

Friend:: By learning from good chefs, obviously.

Socrates:: Good. Now if he wanted to become a good doctor, to whom would he go to become a good doctor?

Friend:: That’s obvious—to one of the good doctors.

Socrates:: And if he wanted to become good with the virtue that makes expert builders good?

Friend:: To one of the builders.

Socrates:: And if he had wanted to become good with the virtue that makes men wise and good, where must he go to learn it?

Friend:: This virtue, too, if it can be learned, I suppose he'd have to learn from good men. Where else?

Socrates:: Then tell me, who were the good men of our city? Let’s consider if these are the ones who make men good.

Friend:: Thucydides, Themistocles, Aristides, and Pericles.

Socrates:: Can we name a teacher for each of them?

Friend:: No, we can’t; I haven’t heard of any.

Socrates:: Well then, can we name a student, either a foreigner or a citizen, or anybody else, either free or slave, who is reputed to have become wise and good by associating with these men?

Friend:: I haven't heard of anybody.

Socrates:: Might they not have been too jealous to share their virtue with other men?

Friend:: Maybe.

Socrates:: Just as chefs, doctors and builders are jealous—that way they won't have any rivals. For it isn't profitable for them to have many rivals or to live among many similar professionals. Is it similarly unprofitable for good men to live among men like themselves?

Friend:: Probably.

Socrates:: But aren't they just, as well as good?

Friend:: Yes.

Socrates:: Does it profit someone to live not among good, but among bad men?

Friend:: I can't tell you.

Socrates:: Well, can you tell me this—whether it's the business of good men to harm, and of bad men to help or vice versa?

Friend:: Vice versa.

Socrates:: The good, therefore, help, and the evil harm?

Friend:: Yes.

Socrates:: Is there anyone who wants to be harmed rather than be helped?

Friend:: Of course not.

Socrates:: Therefore, no one wants to live among bad rather than good men.

Friend:: That's right.

Socrates:: Therefore, no good man will be too jealous to make another man good and similar to himself.

Friend:: Apparently not, according to that argument.

Socrates:: Have you heard that Cleophantus was the son of Themistocles?

Friend:: I've heard that.

Socrates:: Isn't it obvious that Themistocles would not have begrudged his son becoming the best—Themistocles, a man who wouldn't have begrudged that to anyone, if he really was good, which he was, as we admit.

Friend:: Yes.

Socrates:: Did you realize that Themistocles taught his son to be an expert horseman—he could ride standing upright on his horse, he could throw a javelin from this position, and he could perform many other remarkable feats—his father taught him and made him an expert in many other things that require good teachers. Haven't you heard that from the older generation?

Friend:: I have.

Socrates:: So no one could criticize his son's natural ability as bad.

Friend:: Not rightly, at least from what you say.

Socrates:: What about this? Have you ever heard anyone—young or old—say that Cleophantus, the son of Themistocles, was a wise and good man in the way that his father was wise?

Friend:: Never.

Socrates:: Are we to suppose, then, that he wanted to teach his son those things, but he didn't want to make him better than any of his neighbors in the wisdom that he himself enjoyed, if virtue can indeed be taught?

Friend:: That isn't very likely.

Socrates:: And yet he was just the sort of teacher of virtue that you suggested. But let's consider another man, Aristides, who raised Lysimachus. He gave his son the best Athenian education in matters which require teachers, but he made him no better than anyone else. Both you and I know this, for we've spent time with him.

Friend:: Yes.

Socrates:: And you know that Pericles, too, raised his sons Paralus and Xanthippus—in fact, I think you were in love with one of them. As you know, he taught them horsemanship—and they were as good as any Athenian—the liberal arts, and athletic games; he brought them up to be as good as anyone at every skill for which there are teachers; and yet he didn't want to make them good men?

Friend:: But perhaps they would have been, Socrates, if they hadn't died young.

Socrates:: You're coming to the aid of your boyfriend, which is fair enough. But if virtue were teachable and if it were possible to make men good, Pericles would certainly have made his sons expert in his own virtue rather than in the liberal arts or athletic games. But it doesn't seem to be teachable, since Thucydides, as well, raised two sons, Melesias and Stephanus, and you cannot say about them what you said about the sons of Pericles, for you know very well that one lived to a ripe old age, and the other much longer. Indeed, their father taught them well, especially to be the finest wrestlers in Athens. He sent one to Xanthias and the other to Eudorus—weren't they supposed to be the finest wrestlers of the day?

Friend:: Yes.

Socrates:: So it's clear that he would never have taught his sons what he had to spend money on, when he could have made them good without spending anything—wouldn't he have taught them to be good, if it could be taught?

Friend:: That seems likely.

Socrates:: But perhaps Thucydides was a commoner, and he didn't have many friends among the Athenians and their allies? No, but he was from a great household, and he was able to do great things here in Athens and in other Greek cities. So, if virtue could be taught, he would have found someone—either locally or abroad—who could have made his sons good, if he himself didn't have the time because of his political affairs. No, my friend, it looks as if virtue can't be taught.

Friend:: No, probably not.

Socrates:: Well then, if virtue isn't teachable, are men naturally good? If we examine this in the following way, perhaps we might find out. Now then, do we think that good horses have particular natures?

Friend:: They do.

Socrates:: And aren't there some men who have a skill by which they know the natures of the good horses, those physically fit for racing and mentally spirited or else lethargic?

Friend:: Yes.

Socrates:: What, then, is this skill? What name does it have?

Friend:: Horsemanship.

Socrates:: And likewise for hunting dogs, is there some skill by which men can discern the good and bad natures of the dogs?

Friend:: There is.

Socrates:: What is it?

Friend:: Huntsmanship.

Socrates:: And what about gold and silver? Do we think there are moneychangers who separate the good coins from the bad by looking at them?

Friend:: There are.

Socrates:: What do you call them?

Friend:: Assayers.

Socrates:: And again athletic coaches know by looking which traits of the human body are good or bad for each of the events, and in older or younger boys which are going to be their most valuable traits, where they have high hopes for them to succeed in what their bodies can perform well.

Friend:: That's true.

Socrates:: Which of these is more important for cities: good horses, good dogs, and so on, or good men?

Friend:: Good men.

Socrates:: Well? Don't you think, if men had innate characters good for virtue, that people would make every effort to recognize them?

Friend:: Very likely.

Socrates:: Now can you tell me which skill is dedicated to, and capable of judging, the natural qualities of good men?

Friend:: No, I can't.

Socrates:: And yet it would surely be worth a great deal, as would those who possess it, for they could show us which of the young, while still boys, are going to be good. We would take them and guard them in the acropolis at public expense, like silver, only more carefully, so that no harm would come to them, from battle or any other danger. They would be stored up for the city as guards and benefactors when they came of age.

But really, I dare say that it's neither by nature nor by teaching that men become virtuous.

Friend:: How then do you suppose, Socrates, that they become virtuous, if it's neither by nature nor teaching? How else could they become good?

Socrates:: I don’t think it’s very easy to explain this. My guess, however, is that the possession of virtue is very much a divine gift and that men become good just as the divine prophets and oracle-mongers do. For they become what they are neither by nature nor skill: it’s through the inspiration of the gods that they become what they are. Likewise, good men announce to their cities the likely outcome of events and what is going to happen, by the inspiration of god, much better and much more clearly than the fortune-tellers. Even the women, I think, say that this sort of man is divine, and the Spartans, whenever they applaud someone in high style, say that he is divine. And often Homer uses this same compliment, as do other poets. Indeed, whenever a god wishes a city to become successful, he places good men in it, and whenever a city is slated to fail, the god takes the good men away from that city. So it seems that virtue is neither teachable nor natural, but comes by divine allotment to those who possess it.
